Science, Education and Innovations in the Context of Modern Problems (SEI)
Sci. Educ. Innov. Context Mod. Probl.

Science, Education and Innovations in the Context of Modern Problems (SEI) is an international, peer-reviewed, open-access academic journal that publishes cutting-edge research in the fields of science, education, technology, innovation, and interdisciplinary studies. Established in 2018, the journal operates under the umbrella of IMCRA, demonstrating a strong commitment to academic excellence, rigorous research ethics, and global accessibility. SEI fosters interdisciplinary dialogue and emphasizes the dynamic interplay between science, educational development, and technological innovation. The journal prioritizes research that addresses contemporary global and regional challenges, promoting evidence-based solutions to advance knowledge and societal progress.

Science, Education and Innovations in the Context of Modern Problems is an international, peer-reviewed academic journal that publishes original research at the intersection of science, education, and innovation. The journal promotes the practical application of scientific and technological advancements—particularly within educational systems—and welcomes interdisciplinary studies that are original, relevant, and impactful. In addition to education-focused research, the journal provides a platform for scholarly work in the **social sciences**, **pedagogical sciences**, and **technical disciplines**, with a special emphasis on **energy**, **robotics**, and other fields driving innovation. The journal is published entirely in English, with select articles also available in French to engage a broader international readership.

Focus

The primary aim of *Science, Education and Innovations in the Context of Modern Problems* is to foster the integration of science, technology, and education—particularly by promoting the application of cutting-edge scientific and technological innovations in educational and societal contexts.

International Diversity

Science, Education and Innovations in the Context of Modern Problems is firmly committed to internationalization and the promotion of inclusive scholarly communication. The journal's editorial and advisory boards are composed of distinguished academics and experts from a wide range of countries and institutions, including Azerbaijan, Türkiye, Russia, Georgia, Peru, Germany, India, Indonesia, Spain, South Africa, Algeria, Iran, Poland, Vietnam, and beyond.

This global representation underscores the journal's broad outreach, multidisciplinary orientation, and dedication to fostering academic dialogue across diverse cultural, geographical, and research traditions. By integrating perspectives from both developed and developing regions, the journal provides a credible platform for the exchange of knowledge, the advancement of innovation, and the strengthening of cross-cultural academic collaboration.

Keywords Corporate Governance, Board of Directors, Transparency and Disclosure, Administrative and Financial Corruption.
JEL classifications: G3, K2, M1.

Abstract
This research aims to clarify the concept of corporate governance as a new mechanism that focuses on the necessity of following rational methods that work to protect the institution. It does so by striving to satisfy various stakeholders and reconciling their interests, ensuring transparency, accountability, and the protection of capital in companies and markets, as well as safeguarding the interests of stakeholders related to the institution. Most importantly, it aims to restore the trust of market participants, especially following collapses and failures that have occurred. We concluded that corporate governance is the way in which institutions are managed and monitored by all parties concerned with the institution. Algeria, like all countries, faces numerous economic, social, and political challenges, necessitating the prompt evaluation of its current situation and planning to keep pace with developments in alignment with its values, principles, and capabilities, in order to achieve efficient management of Algerian institutions, ultimately enhancing corporate performance.

1. Introduction:

Corporate Governance [CG] is a relevant issue in academic writing and finance and accounting fields due to the chain of financial scandals around the world. CG monitors the effectiveness of management and ensures legal compliance by preventing irregular and improper behaviour. In this sense, leading global institutions such as the Organization for Economic Cooperation and Development [OECD], the International Finance Corporation [IFC] and the World Bank, strongly emphasize the development of different regulations, guidelines and good governance codes around the world. OECD affirms that CG "has implications for company behaviour towards employees, shareholders, customers and banks". (Briano-Turrent & Rodríguez-Ariza, 2016, p. 63)

Corporate governance refers to a set of rules, systems, and procedures that regulate the relationships among key stakeholders, including corporate management, shareholders, and interest groups, as well as the control and disclosure systems that impact corporate performance. Its primary aim is to enhance quality and boost performance rates by establishing strategic plans and objectives for companies. It also involves setting appropriate incentives for management to achieve these objectives in a manner that serves both their own interests and those of the shareholders, while encouraging adherence to the principles of transparency and the prevention of conflicts of interest and materially or ethically unacceptable conduct. This is achieved within the framework of regulatory systems overseeing corporate management and board members, and by clearly defining the distribution of rights and responsibilities between the board of directors and shareholders. Governance procedures also outline the workflow within companies to ensure the achievement of governance objectives.

Given its importance, companies of various types, whether joint-stock companies or family-owned businesses, strive to implement governance practices in order to realize several key benefits, most notably: fostering a climate of confidence among investors and shareholders, maximizing corporate value, and strengthening competition in global financial markets. All these efforts aim to avoid the crises faced by several major international companies listed on prominent financial markets.

Based on the above, we can formulate the following main research question:

What is the concept and reality of corporate governance in Algeria?

Research Hypotheses:

- The concept of corporate governance is multifaceted and complex across different fields due to varying circumstances and environments surrounding it.

- Corporate governance constitutes the rules through which a company is directed and controlled, including mechanisms that organize the different relationships among the board of directors, executive managers, shareholders, and stakeholders.
- Corporate governance is achieved by adopting a policy of change and development of the mechanisms that govern it, along with undertaking fundamental reforms that ultimately lead to the realization of its objectives.
- Algerian economic enterprises are striving to implement the principles of the governance system despite the novelty of its practice.

This research aims to highlight the following points:

- To identify and enumerate the reasons behind the growing interest in the subject of governance in general, and corporate governance in particular;
- To gain comprehensive knowledge of the various global models of corporate governance;
- To emphasize that the application of modern management approaches and corporate governance mechanisms has become an imperative for Algerian economic enterprises in the context of global integration;
- To assess the reality of corporate governance in Algeria by diagnosing the state of its institutional framework and the mechanisms of its implementation.

1.3 Research Methodology:

In this study, we have adopted the descriptive-analytical method by describing the theoretical aspect of the subject under investigation and analyzing its related elements through the use of specific statistical tools such as tables, figures, and others, while also addressing the case of Algeria.

The Concept of Economic Institutions Governance:

Below, we will clarify the fundamental concepts related to the governance of economic institutions:

Historical Overview:

The term "governance" traces back to an ancient Greek word from the 13th century, *kuberman*, which referred to the ability and skill of a ship captain in steering through waves, storms, and tempests, embodying noble values, ethical conduct, and integrity in safeguarding the lives and possessions of passengers, caring for entrusted goods, and ensuring their safe delivery to rightful owners while defending them against pirates and other dangers encountered during navigation. When such a captain successfully completed his mission and returned safely to the departure port, he was referred to as a *good governor*.

The term "governance" (*gouvernance*) was first used in Old French during the 13th century as a synonym for "government" (*gouvernement*). Similarly, it was employed in Latin under the term *gubernare* at the beginning of the 14th century with the same meaning. In English, the term *governance* was introduced to denote the method or process of management or rule (Ghadban, 2013, p. 2).

In the modern era, the concept of corporate governance emerged in the 1930s in the United States, where debates arose concerning the relationships between managers and shareholders. Berle and Means pointed to the risks inherent in the separation of ownership and management within corporations. This highlighted the need to control or monitor managers and to protect the interests of minority shareholders.

The concept of corporate governance evolved further following the Treadway Commission Report of 1987, which aimed to address concerns regarding the functioning of corporate administrative bodies and their relationships with shareholders. These concerns were structured around three main axes: the credibility or legitimacy of authority within corporations, the transparency of decision-making processes, and the effectiveness of corporate monitoring mechanisms (Thierry et al., 2003, pp. 103–104).

Efforts continued across most countries to establish corporate governance principles and rules; however, Arab countries were relatively late in officially issuing such frameworks. The earliest instances of establishing corporate governance principles in Arab countries date back to 2004 in Oman and 2005 in Egypt (Ben Saha & Boukhari, 2013, p. 333).

In Algeria, the term "good governance" (*gouvernance raisonnée*) was adopted as a synonym for corporate governance. It refers to an administrative and voluntary process aimed at achieving transparency and rigor in the management, administration, and monitoring of corporations, with the goal of ensuring the sustainability and competitiveness of the institution through: "defining the rights and duties of the stakeholders within the corporation, and sharing the powers and responsibilities arising from the initial step" (Ghadban, 2013, p. 6).

Definition of Corporate Governance:

Some authors provide a broad definition of corporate governance. In this context, G. Charreaux defines it as encompassing all organizational mechanisms that influence the distribution of authority and impact managerial decision-making. In other words, governance dictates managerial behaviour and guides their discretion.

This definition allows for a better understanding of the underlying challenges of corporate governance by involving all the relationships that a corporation maintains with its various stakeholders: shareholders, bankers, employees, clients, public authorities, and all parties interested in the corporation's activities.

The issue, therefore, extends far beyond the traditional focus on the relationship between managers and shareholders; it broadens to include all stakeholders. Consequently, governance not only ensures the proper use of resources to create and preserve wealth, but also aims to promote the common good, grounded in ethical principles.

According to J.-C. Shaw, the objective behind this concept is that the behaviour of leaders should enable humanity to advance while simultaneously fostering the development of social justice in a well-protected environment. Thus, corporate governance aligns with the goals of sustainable development (Thierry et al., 2003, pp. 107–108).

Objectives and Core Principles of Corporate Governance:

The Principles of Corporate Governance were approved in 1999 by the Ministers of the Organisation for Economic Co-operation and Development (OECD). Since then, they have been regarded as an international reference.

Corporate governance, through regulating the relationship between stakeholders, aims to achieve three main objectives: (Ghadban, 2013, p. 5)

- A **narrow approach** focusing on the necessity for governance to work in the interest of shareholders by reducing the cost of capital.
- A **broader approach** emphasizing the need to improve corporate performance as the center of wealth creation.
- A **comprehensive approach** which adds further responsibilities to corporate governance, such as commitment to social responsibility, business ethics, and so on.

Corporate governance encompasses all organizational mechanisms within the economic and social system with the objective of ensuring the achievement of common goals: security, prosperity, cohesion, order, system sustainability, and sustainable development.

The key principles on which corporate governance is based include: (Bakkour, 2013, p. 9)

- **Shareholder Rights:** Safeguarding secure ownership of shares, disclosure of relevant information, the right to vote, and participation in major decisions regarding the sale or restructuring of corporate assets, including mergers and new share issuances.
- **Equitable Treatment of Shareholders:** Ensuring fair treatment of all shareholders, including minority and foreign shareholders, and guaranteeing that all shareholders can seek effective redress for violations of their rights.
- **Role of Stakeholders in Corporate Governance:** Recognizing the rights of stakeholders established by law or through mutual agreements and encouraging active cooperation and communication between corporations and stakeholders to create wealth, employment opportunities, and ensure corporate sustainability based on sound financial practices.
- **Transparency and Disclosure:** Ensuring the accurate and timely disclosure of all material matters regarding the corporation, including financial performance, ownership, and governance structures and policies.
- **Responsibilities of the Board of Directors:** Ensuring the strategic guidance of the company, effective monitoring of management by the board, and the board's accountability and loyalty to the company and its shareholders.

Stakeholders Involved in the Implementation of Corporate Governance and Its Models:

Below, we clarify the stakeholders involved in the implementation of corporate governance and its various models:

Stakeholders in the Implementation of Governance: Corporate governance, in terms of the stakeholders involved in its implementation, can be divided into four main parties. These parties are both influenced by and influential in the proper application of governance and contribute significantly to its success or failure. These parties are as follows: (DJOUADI & BENAMARA, 2018, p. 101)

Shareholders: They provide the company's capital by owning shares in exchange for investment returns.

Board of Directors: They represent the shareholders as well as other stakeholders. Through its members, the Board of Directors is responsible for appointing executive managers who are entrusted with the daily management of the company's operations, in addition to monitoring their performance.

Executive Management: This body is responsible for the actual administration of the company and for providing performance reports to the Board of Directors. It also bears the responsibility for transparent disclosure of information and for enhancing the company's value by maximizing profits.

Stakeholders: It is important to note that shareholders are not the only creditors of the company. Maximizing shareholder value alone is insufficient if not accompanied by meeting the needs of a broader range of stakeholders both within and outside the company, such as creditors, suppliers, and employees.

Moreover, these various stakeholders may sometimes have conflicting interests. For example, creditors are mainly concerned with the company's ability to repay its debts, while employees are more interested in the company's ability to ensure long-term sustainability (Faddaoui, 2014, p. 44).

Models of Corporate Governance:

The methods adopted by different institutions to obtain financing and ownership are considered among the most important determinants of corporate governance.

The models vary from one country to another due to differences in economic, legislative, political, and social conditions, as well as the nature of relationships among various stakeholders.

It should be noted that leading governance models around the world have been classified into market-oriented models, network-oriented models, and hybrid models that combine features of both previous types.

The following table presents the main corporate governance models in practice:

Table 1: Corporate Governance Models

Model	Anglo-Saxon Model	German Model	Japanese Model	Hybrid Model
Objective of the Corporation	Maximize profits and owners' wealth.	Achieve the interests of various stakeholders, such as employees, lenders, and shareholders.	The corporation is a community with multiple stakeholder groups, aiming also to fulfill shareholders' desires and maximize their wealth.	Combines consideration of shareholders' interests with the interests of other stakeholder groups.
Stakeholder Group Influencing Management	Shareholders.	Shareholders and stakeholders (e.g., employees, banks).	Shareholders and stakeholders (e.g., employees, major clients, and banks).	Shareholders; however, influence is not absolute and requires consensus of 50% of shareholders.
Board of Directors	Relies on a single Board of Directors to manage the corporation.	Relies on two boards: – Supervisory Board: composed of representatives of shareholders and employees. – Management Board: responsible for overseeing executive management.	Relies on a single Board of Directors.	French law permits either a single Board of Directors or two separate boards; however, typically a single board manages the corporation.
Existence of an Efficient Market for Corporate Control	Active mechanism: capital markets are efficient with laws facilitating market control.	Passive mechanism: many laws restrict corporate takeovers, though some authors noted recent developments allowing more takeovers.	Passive mechanism: intertwined relationships and cross-shareholding between corporations limit takeovers, though some shifts have been observed.	Passive mechanism: used infrequently.
Ownership Concentration	Ownership is dispersed; e.g., in the U.S., laws prevent individual investors from owning beyond a certain limit.	High ownership concentration: the top five shareholders, primarily banks and institutional investors, may control up to 80% of shares; sometimes an individual investor holds more than 50%.	Moderate ownership concentration, lower than in the German model.	Companies may be controlled by the government or families; ownership is concentrated but less so than in the German model.
Executive Compensation	Strongly tied to performance and	Not primarily linked to performance.	Not primarily linked to executive	Generally not linked to performance, except in

	success achieved.		performance.	France where some performance-based incentives exist.

Objectives and Importance of Corporate Governance:

Objectives of Corporate Governance:

The rules of governance aim to regulate and guide administrative, financial, and technical practices, and to ensure adherence to established controls and policies. They address the proper application of rules, aid in attracting investments, enhance competitiveness, combat corruption in all its forms, whether administrative, financial, or accounting, and support the stability of financial markets and the improvement of the economy, through the following means: (Zerzar, 2010, p. 4)

- Emphasizing compliance with the law and ensuring the review of financial performance, while establishing administrative structures that enable the accountability of management before shareholders, along with the formation of an audit committee composed of non-board members, entrusted with various tasks, powers, and competencies to achieve independent oversight;
- Strengthening the element of transparency in all company transactions, operations, accounting procedures, and financial auditing in a manner that limits administrative and financial corruption: (Khalil & Al-Ashmaoui, 2008, p. 35)
- Improving the efficiency of the company's resource utilization and maximizing its market value, thereby enhancing its ability to attract necessary local and global financing sources for expansion and growth, enabling the creation of new job opportunities while working to reinforce market stability, which ultimately leads to achieving efficiency and development;
- Ensuring fair treatment of stakeholders in the event of the company's insolvency;
- Increasing confidence in the national economy, deepening the role of the capital market, enhancing its ability to mobilize savings, raising investment rates, and supporting competitiveness;
- Overseeing the company's social responsibility through appropriate procedures linked to activities serving the environment and society;
- Curbing potential managerial misconduct and ensuring effective alignment between the interests of management and those of shareholders (Talib & Al-Mashhadani, 2011, p. 43);
- Achieving long-term competitiveness, thereby creating incentives for development, the adoption of modern technologies, and raising investor awareness so that the company can withstand intense competition.

The Importance of Corporate Governance:

The importance of governance in corporate management is increasing in order to establish trust in the financial information contained in published financial statements, with the aim of protecting users of these statements. Corporate governance is considered one of the most essential and necessary processes for any company to perform its functions fully and to ensure the integrity of its board of directors, as well as to guarantee the company's fulfillment of its obligations and achievement of its goals in a lawful and sound economic manner. Generally, the importance can be distinguished between its significance for companies and for shareholders (Nasr Ali & Shehata, 2007, pp. 28–29).

The Importance of Governance for Companies:

The importance of governance for companies is evident in that it:

- Enables the enhancement of the company's economic efficiency by establishing foundations for the relationship between company managers, the board of directors, and shareholders;
- Leads to openness to global financial markets and the attraction of a broad base of investors to finance expansion projects;
- Companies that apply governance rules enjoy increased investor confidence, as these rules ensure the protection of their rights.

The Importance of Governance for Shareholders:

The importance of corporate governance for shareholders is reflected in that it:

- Assists in guaranteeing the rights of all shareholders, such as the right to vote and the right to participate in decisions related to any substantial changes that may affect the company's future performance;
- Full disclosure of the company's performance, financial position, and key decisions made by senior management helps shareholders assess the risks associated with investing in these companies.

Additionally, the importance of governance lies in: (Suleiman, 2008, p. 15)

- Reducing the risks related to financial and administrative corruption faced by companies;
- Raising the performance levels of companies, thereby driving economic development and progress in countries;
- Enhancing the competitiveness of national companies globally and opening new markets for them;
- Providing the regulatory framework through which a company can define its objectives and the methods for achieving them.

The Reality of Corporate Governance in Algeria:

The issue of governance, in general, was not initially raised for discussion in Algeria. However, following persistent pressure from international financial institutions, led by the International Monetary Fund and the World Bank, it became necessary to adopt governance principles both at the macro level in economic management and at the micro level in institutional management. This prompted the state to form a committee called the "Good Governance Committee," which some considered merely formal and primarily aimed at appeasing external parties exerting constant pressure.

Among the indicators suggesting the adoption of governance principles in Algeria are the following:

- **The Establishment of the National Body for the Prevention and Fight Against Corruption:**
  This body was created pursuant to Article 17 of Law No. 06-01 dated February 20, 2006, concerning the prevention and fight against corruption. Article 20 of the same law defined the missions of this body, which are as follows: (Official journal, 2006, p. 4)
    - ✓ Proposing a comprehensive anti-corruption policy embodying the rule of law and reflecting integrity, transparency, and accountability in the management of public affairs;
    - ✓ Providing guidance on corruption prevention to any individual, public or private entity;
    - ✓ Developing programs to raise public awareness of the harmful effects of corruption;
    - ✓ Collecting and centralizing all information that may contribute to uncovering acts of corruption and preventing them;
    - ✓ Internationally assessing the effectiveness of legal instruments and administrative procedures aimed at preventing and combating corruption;
    - ✓ Periodically receiving asset declarations from public officials;
    - ✓ Utilizing the public prosecutor's office to gather evidence and investigate facts related to corruption;
    - ✓ Ensuring the coordination and monitoring of activities and operations in the field.

Recently, this body joined the Arab Anti-Corruption and Integrity Network (ACINET), established in 2008, thereby becoming part of a group that includes 42 ministries and other bodies in the Arab region (ACIAC, 2013).

- **The Convening of the First Conference on Corporate Good Governance in January 2007:**

This conference served as a valuable opportunity for all active stakeholders in the corporate world to come together, representing the first scientific recommendation and step taken toward this goal (Ben Abderrahmane & Ben Cheikh, 2013, p. 4).

- **The Establishment of a Corporate Governance Working Group:**

Algerian business associations and federations took the initiative to explore ways to encourage the adoption of new governance practices within the business community, with the aim of attracting foreign direct investment. To lead this process, stakeholders from both the public and private sectors established in 2007 a Corporate Governance Working Group. This group worked in collaboration with the Global Corporate Governance Forum (GCGF) and the International Finance Corporation (IFC) to develop a Corporate Governance Guide for Algeria (Youb, 2017, pp. 92–93).

- **The Issuance of the Algerian Corporate Governance Guide:**

The 2009 Corporate Governance Guide in Algeria, titled the "Charter of Good Governance in Algeria," is derived from the principle that prudent management practices and measures are codified within the Charter, forming a reference for all stakeholders in the corporation. It serves as a practical and simplified tool to incorporate the fundamental principles

of good corporate governance, aiming to initiate a process for the practical implementation of these principles. The Charter is positioned within the context of the existing legal and regulatory framework and aligns with its provisions.

- **The Governance Support Program in Algeria:**

A program for supporting economic governance, called "SPRING," was implemented in Algeria as part of the Governance Support and Implementation Program, funded by the European Union with an allocation of 10 million Euros. By December 2013, 63% of the funds had been utilized. The program was planned for a five-year period, ending in December 2018. It focused on assisting Algeria in improving economic governance, combating corruption, promoting democratic governance, and enhancing access to quality economic resources.

- **The Governance System in Algeria:**

Many studies, conferences, and symposiums held in Algeria have concluded that there is no effective application of governance principles in the country; rather, what exists is a form of random management. In order to establish a sound governance system in Algeria, there must be coordination among the following four elements:

- ✓ **Values:** Participation among individuals;
- ✓ **Structures:** State structures, ministries, and all state institutions;
- ✓ **Management Frameworks:** Methods of managing operations, equipment, raw materials, information, and human resources;
- ✓ **Means or Methods:** Including the state's policies, programs, and projects.

Moreover, there is no vision for the future, as there are no structures capable of anticipating new variables, and the management system currently in place remains administrative in nature. It should instead be based on a system focused on achieving desired results. Unfortunately, Algeria's management system is still far from this ideal (Miloudi, 2018, p. 151).

Today, Algeria ranks among the last countries in terms of corruption levels, according to Transparency International's Corruption Perceptions Index for 2018, where it ranked 105th out of 180 countries. This highlights that the implementation of governance mechanisms in Algeria remains weak despite the efforts exerted. This is due to several factors, including the legacy of centralized economic planning, excessive bureaucracy, and entrenched favouritism, all of which have contributed to the weakening of institutional development.

Amidst all these conditions, Algeria is witnessing the opening of its economy and is continuously striving to improve the business climate within a competitive environment. It has restructured all sectors and reformed the accounting system to lay the foundations for the four governance principles set forth in the "Algerian Charter." As a result of these restructuring efforts, the private sector has emerged and grown across all fields. Enhancing corporate governance will contribute to business expansion, improve the business climate, and support the recovery of the national economy.

Obstacles to the Application of Corporate Governance Principles in Algeria

There are several obstacles that hinder the effective implementation of corporate governance principles in Algeria. These obstacles may arise from within the company itself or from external factors, and they can be summarized as follows: (Sbayhi, 2013, p. 668)

Internal Sources:

These are mainly related to the lack of separation between ownership and management. In most global economies where corporate governance is effectively applied, companies strive to distance themselves as much as possible from family-owned businesses. It is not necessary for the Chairman of the Board or the Chief Executive Officer to be the individual holding the largest share of the company's stock or someone with extensive ties to shareholders. Rather, it is crucial that the chairman possesses a high degree of competence, efficiency, and effectiveness in managing the company.

Under this main obstacle, several secondary barriers emerge, the most notable of which are:

- **Board of Directors:**

The absence of a clear separation between the responsibilities of the Board of Directors and those of executive management, inadequate oversight levels, and an insufficient number of board meetings.

- **Board Members:**

The lack of a sufficient number of independent, non-executive directors on the Board who are capable of providing independent opinions and judgments, stemming from their sense of responsibility, experience, and understanding of the company's operations.

- **Board Committees:**

Particularly the Audit Committee, the Compensation and Nominations Committee, and the extent of their effectiveness and independence, including the presence of independent non-executive members within them.

6.2 External Sources:

These relate to the general investment climate in the country and the extent to which laws and regulations governing economic activities are available, ensuring that the implementation of corporate governance within companies is mandatory and that there are no contradictions with these laws.

Challenges to the Application of Corporate Governance in Algeria

The practical application of governance faces a set of challenges that can be summarized as follows: (Sbayhi, 2013, pp. 668–669)

Corruption:

The emergence of corruption is often linked to the absence of governance, leading to numerous serious and negative consequences. The spread of corruption resulting from the lack of governance causes the flight of foreign investments. Additionally, corruption incurs other economic costs, such as the reduction of government spending on socially-oriented projects and the worsening of resource misallocation.

The biggest challenge facing the implementation of governance is the expansion of corruption to include government agencies that are originally tasked with combating corruption. Corrupt governments often resist legislative reforms, aiming to maintain the corrupt environment from which they derive significant benefits.

Practical Implementation and Democracy:

While developing and emerging economies attempt to apply governance properly and effectively, they must simultaneously work on establishing the foundations of democracy, which brings several positive effects:

- Democracy serves as an automatic mechanism for the peaceful transfer of power, based on principles of pluralism and freedom, which act as barriers against any party or political force monopolizing power, thereby narrowing the scope of corruption and its negative impacts;
- Democracy provides legislative and parliamentary councils with the opportunity to perform their oversight and legislative duties independently and without any external pressures.

Respect for the Rule of Law:

Nothing can be effective unless it complies with the law, and the same applies to governance. Governance cannot exist without supportive and protective legal frameworks. The importance of the rule of law lies in its role as one of the key tools in attracting foreign investment. However, there may be contradictions between legal texts, thus special attention must be given to important elements to bridge the gap between law and its practical application, including: clarity, specificity, commitment to enforcement, and the establishment of rewards and penalties.

Establishing a Sound Relationship Between Stakeholders:

The acts of collusion and corruption between boards of directors and senior executive managers not only harm the rights of stakeholders but also endanger the company and its future.

Thus, it is crucial to implement a set of procedures and policies aimed at protecting the rights of stakeholders within the company.

Measures to Improve Corporate Governance in Algeria

For corporate governance to be properly implemented, a set of procedures must be adopted, forming the foundation of a corporate governance system aimed at improving institutional performance. These measures are as follows: (Sbayhi, 2013, p. 669)

Short-term Measures:

- The company must adopt a **written corporate governance policy** that is disclosed and announced. This policy should explain the establishment of the board of directors, the roles and qualifications of its members, and the creation of an advisory board.

  It should also clarify communication channels with minority shareholders and how they are treated, accounting and disclosure systems, the treatment of other shareholders, the appointment of independent auditors, and the publication of a timeline for company events;

- The corporate governance policy must stipulate the establishment of an **advisory board** composed of three to four members.

  The purpose of creating an advisory board is to assist in decision-making by providing management and the board with objective and independent perspectives, and to offer potential candidates for independent board member positions to the shareholders;

- The company must appoint a **delegated board member** chosen from among the market's experts;

- The company must adopt and publicly disclose a **corporate social and environmental policy** directed towards citizens;

- All essential company documents must confirm and guarantee **equal treatment of minority shareholders**, including internal regulations and the company's bylaws.

Medium-term Measures:

The corporate governance policy should aim to form the advisory board within one year, holding four meetings annually.

The company must establish a schedule for these meetings and prepare the necessary documents, which should be delivered to advisory board members before the meetings.

The corporate governance policy should include the following:

- Appointment of an **independent, non-executive board member** within two years (who can also be part of the advisory board);
- The company must disclose, in its **annual report to shareholders**, the contents and level of implementation of its written corporate governance policy and its corporate social and environmental policy towards citizens;
- The company must disclose, in its **annual report**, the degree of its compliance with corporate governance rules.

Conclusion

Corporate governance encompasses a blend of regulatory frameworks largely driven by the private sector. In countries with more advanced financial markets, governance rules, regulations, and structures are incorporated into laws that protect private property rights and shareholder interests. These are complemented by legislative provisions, regulatory rules, judicial decisions, and stock exchange registration requirements, forming an essential governmental infrastructure for corporate governance.

In addition to formal rules, companies adopt best practice principles and guidelines, which are continuously developed by the private sector and academia in response to prevailing market conditions and investor demands. Developing countries must take both elements into account, governmental infrastructure and best practices, as they seek to establish a corporate governance framework capable of enhancing investor confidence, attracting capital, and thereby promoting investment and economic growth. Of course, these principles must be adapted and modified to fit local needs, without neglecting the fundamental principles proposed by the Organisation for Economic Co-operation and Development (OECD).

From the above, the following conclusions can be drawn:

- The concept of governance is relatively new in usage and application; its understanding remains inconsistent among countries, especially Arab countries, due to the prevalent governance and management styles.
- Governance requires significant resources for effective application, which can be challenging given the scarcity of resources in some countries.
- Governance reform is a serious endeavour that demands strategies and methods to overcome the obstacles hindering economic development.
- Governance cannot be established without the rule of law, genuine democracy, political pluralism, and popular oversight.
- It is not possible to rely solely on the current legislative frameworks to implement governance in Algeria. Laws must be clear, consistent, easily applicable, and not open to dual interpretations, with all stakeholders participating in their formulation.

Key Recommendations

- Develop an effective mechanism to ensure a sufficient level of transparency for shareholders, allowing them to understand their rights and obligations through the company's founding documents;
- Establish regulations requiring companies to increase transparency and disclose all information related to company activities;
- Create harmony and alignment among the newly developed regulations and systems designed to address current economic requirements and developments;
- Devise means to combat the manipulative practices some company administrations resort to;
- Equip boards of directors and specialized personnel across various fields to enhance the oversight capacity of committees monitoring executive management activities;

- Clearly define the competencies and responsibilities among related entities to prevent overlap, conflicts, and disputes;
- To meet the requirements of good governance in Algeria, comprehensive development must be achieved across all sectors, including human development, political development, economic development, administrative development, social development, and technological development.

Conflict of Interest

The authors declare that there are no conflicts of interest regarding the publication of this article.

Abstract

In contemporary local and international historiography, aspects of the history of education in medieval Azerbaijan have been studied in general terms. Existing research primarily focuses on educational institutions (madrasas and Sufi lodges) and certain cultural fields such as science, literature, and architecture. This article examines previously under-researched topics in Azerbaijani cultural history, including the duration and level of education, teaching methods, textbooks, libraries, academic calendars, scholarships for students, salaries for teachers, and the education and upbringing of orphans.

The rich cultural heritage of the Middle Ages has often been studied mainly through the lens of political and social events, leaving issues closely related to daily life in the background. However, material, religious, legal, and moral culture often preceded political developments. Historical rulers relied on defining and supporting their material and cultural resources. The fact that many medieval Azerbaijani rulers were also recognized as scholars or poets reflects the significance and level of education during that period.

1. Introduction

Sources indicate that cities in medieval Azerbaijan often contained multiple secondary and higher education institutions, large waqfs (e.g., Rabi-Rashidi), and even entire waqf cities (e.g., Qazaniyya). Madrasas employed numerous scholars and instructors and maintained large, well-known libraries, reflecting a relatively high public literacy level. Certain fields, particularly literature, political science (court and administrative schools), and medicine, were widely studied and developed.

Specialized schools existed to train state officials, civil servants, and even military personnel. Consequently, the Middle Ages saw a strong societal interest in education, countering modern historiographical assumptions that medieval populations were largely uneducated.

2. Diversity of Educational Fields

The medieval Azerbaijani education system was part of the broader Eastern Islamic educational framework, extending far beyond madrasas. Several characteristics stand out:

1. Education influenced all political and social sectors.

2. Educational opportunities and institutions were diverse.

3. Literacy and scholarly achievement conferred a special status in society.

4. State personnel policies relied on educated individuals in administrative and governance structures.

Mazahiri (1972) notes that from the 10th century onward, a significant transformation occurred in Islamic education:

"Until then, in the medieval Middle East, schools were limited to basic instruction in religious doctrines at mosques or in institutions such as the 'Dar al-Hikmat' (House of Wisdom), established by Muslim philosophers or Mu'tazilite scholars, which could be considered academies. No intermediate level of education existed between these two. Therefore, we must acknowledge that no organized general education system existed before the 10th century. The general population learned only religious doctrines, practical aspects of religion, and basic literacy and numeracy, while elite social strata—mostly theologians aligned with Mu'tazilite thought, rulers, and politicians—studied philosophy and exact sciences" (Mazahiri, 1972, p. 159).

3. Educational Institutions in Medieval Azerbaijan

From the 10th century onward, madrasa education coexisted with other forms of schooling. Key educational centers included:

- Schools and kuttabs
- Suffa
- Mosques and jamiʿ mosques
- Palaces and court schools
- Libraries and bookshops
- Houses of scholars (ʿulama)
- Literary centers
- Badia (desert education)
- Harem schools (for palace women)
- Madrasas
- Ribats and Sufi lodges

Among these, madrasas, palaces, and mosque-jamiʿ complexes were the primary institutions (Çelebi, 2013, p. 23). All were commonly referred to as *schools*. Since religious study centered on books, schooling initially meant reading-based learning. Over time, the term *school* expanded to include primary education (Makdisi, 2007, p. 58).

4. Specialized Forms of Education: Badia

A notable educational practice was *badia*, or desert education. Students seeking mastery of a language lived among nomadic tribes to gain immersive practical experience. For example, the 10th-century poet Sayyiduk, after completing his literary studies in Basra, spent ten uninterrupted years among Bedouin tribes to perfect classical Arabic. Contemporary sources described him as "the most renowned poet, lexicographer, and linguist" (Çelebi, 2013, p. 23).

Similar practices existed among Turkic peoples. Mahmud al-Kashgari, in his *Divanü Lügati't-Türk* (1072–1074), collected many words from nomadic Turkic tribes, illustrating the practical and immersive approach to education in the medieval period.

5. Education Duration and Level

The concept of schooling in medieval Azerbaijani schools was not limited to providing basic education, as commonly assumed. A student receiving instruction at a school or kuttab often attained literacy sufficient to author works. For instance, Muhammad, the son of Dawud ibn Ali al-Zahiri, founder of the Zahiri school of thought, received kuttab

education yet produced the renowned work *Kitab al-Zahra* at the age of 15. Similarly, in the 11th century, a poet from Wasit began serving in a governmental secretariat after completing his school education.

Yaqut al-Hamawi, of Roman origin, authored the encyclopedic work *Kitab al-Buldan* despite being born into slavery. He learned reading and writing from his merchant master, who subsequently sent him to school. Initially working for his master and later as a merchant and bookseller (sahaf) after the master's death, Yaqut produced a multivolume work containing significant information about Azerbaijan, testifying to the high quality of primary education (Brockelmann, 1942, pp. 249–250). These examples highlight the **advanced educational standards** maintained in schools and kuttabs.

Students were primarily guided by a master scholar regarded as an expert in the literary sciences, effectively preparing them for higher education. Education in these institutions rarely lasted less than ten years. Considering that Ahmad ibn Ali al-Zawwal (1115–1190), a descendant of Caliph Ma'mun, left school at age 14 after ten years of study, it can be inferred that primary education for Muslim children typically began at 4–5 years of age and rarely exceeded 7–8 years (Makdisi, p. 59). However, individuals who could not pursue literacy during childhood could enroll in schools at any age, as Yaqut al-Hamawi did.

To ascertain the duration and level of education in the Eastern Islamic world, including Azerbaijan, references can be made to Yaqut al-Hamawi's accounts of the Ghaznavid Sultanate (962–1187) and the autobiography of the famous historian Beyhaqi. According to Hamawi, Abu'l-Fazl Beyhaqi had received instruction in **grammar, lexicography, and literature-poetry** by the age of 15, studying 11 books that included fiqh (Islamic law), natural sciences, astronomy, and an Arabic-Persian dictionary covering earthly beings (Makdisi, p. 59). This indicates that schools imparted **foundational scientific terminology and knowledge**.

Graduates could continue with **10–11 years of higher education**, primarily necessary for professional fields requiring advanced expertise, such as fiqh (law) and medicine (tibb). The 12th-century Central Asian historian, muhaddith, theologian, and philologist Abu Sa'ad Abd al-Karim ibn Muhammad al-Samani al-Marwazi (1113–1167) provides valuable insights into the excellence of Islamic education. His work *Kitab al-Ansab* (Book of Lineages) documents over a hundred Azerbaijani scholars, reporting that after ten years of school and 10–11 years of madrasa study, hundreds of scholars from cities including Urmia, Khoy, Ardabil, Maku, Nakhchivan, Shamakhi, Ganja, and Beylagan served across regions from Cairo to Shash in roles such as secretaries, physicians, judges, and madrasa instructors (N. Aliyeva, 2010, pp. 91–133).

The **quality and level of education** in Azerbaijani schools and madrasas, as well as in waqfs and palace institutions, matched those in other major Islamic cities. Evidence from the prominent Arab scholar Ibn Makulan (1030–1082), who visited Ganja, highlights the mosque, madrasa, and library, listing 55 Azerbaijani scholars and shedding light on the intellectual environment (N. Aliyeva, 2014, p. 20).

High-level educational institutions in Azerbaijani cities were already established by the 7th–8th centuries, as reflected in *al-Ikmal fi Asma' al-Rijal* by the Tabrizi scholar Waliuddin Abu Abdullah Muhammad ibn Abdullah al-Amri, which covers the biographies of 8th-century Azerbaijani thinkers. Additionally, *Kitab al-Mushtarak* documents 21 Azerbaijani localities and mentions their educational centers (N. Aliyeva, p. 62).

From the 11th century onward, during the Seljuk and later Atabeg periods, Azerbaijan hosted schools, madrasas, and palace institutions recognized throughout the Eastern Islamic world. Researcher Nargiz Aliyeva has compiled a list of higher education institutions from this period, including madrasas in Ganja, Shamakhi, Beylagan, Maragha (Atabegs, Qazi, Ahmadaga), Zanjan, Nakhchivan, Marand, and Khoy (N. Aliyeva, 2015, pp. 67–74, 78, 84–86).

During the periods of the Jalairids, Qara Qoyunlu, Aq Qoyunlu, and Safavids, a significant number of madrasas operated in Azerbaijan. Examples include the Taj al-Din Shah Alishah Madrasa, the Qiyasiyya Madrasa founded by Rashid al-Din's son Qiyas al-Din Muhammad, the Amir Shaykh Hasan Jalairi Madrasa, the Shaykh Uways Madrasa, the Sultan Ahmad Jalairi Madrasa, as well as the Muzaffariyya and Bayim Madrasas constructed by Khadijah Bayim, the wife of Shahanshah. Each of these madrasas trained specialists in various fields of knowledge. For instance, the *Madrasa-i-Tibb* established in the village of Malham in Shamakhi, which operated for many years, served both as a high-level medical education center and a hospital. This center was founded by Qafiyaddin Umar ibn Osman, the uncle of the renowned poet Khaghani. Considering Qafiyaddin's connections with the Shamakhi madrasa, it can be inferred that there was a form of student exchange among madrasas at the time (N. Aliyeva, 2015, p. 86).

Research indicates that the **duration of primary education** for those desiring to study did not exceed 10–11 years. However, it cannot be claimed that all students completed the full course. The majority, as noted by Ali Mazaheri, likely left after acquiring fundamental knowledge in religious sciences. After completing school and kuttab education, higher education commenced, typically lasting a minimum of 10–11 years. Those who obtained an *ijazah* (diploma) following this period were employed in hospitals, madrasas, or the legal system. This suggests that the **average educational trajectory of a specialist** lasted no less than 20 years. Thus, a child starting school at 4–5 years old could potentially graduate from a higher education institution by age 25. Some scholars, however, extended their studies beyond this period; for example, Beyhaqi completed his education at the age of 37, implying over 30 years of study (Makdisi, p. 60).

Differences in higher education duration also depended on the **rank and significance of the school**. Divan schools, for instance, functioned akin to universities specializing in political administration, training personnel who would serve in roles ranging from secretaries to viziers. Sultans also trained officials acquired as *qulam* (slaves) for military, political, and security services in these schools. Nizam al-Mulk notes in *Siyasatnama* that these *qulam* rarely assumed official positions before the age of 30 (Nizam al-Mulk, 1999, p. 74; N. Akbar, 2017, p. 160). Divan schools emphasized mathematical sciences. Abu Ja'far ibn Shirzad, who lived in the 10th century, reports continuing his divan school education until age 20, noting that his older brother studied there as well (Makdisi, p. 76).

Education at a palace or divan school was a primary means of entering and advancing within the state system. For example, during the Fatimid period, it was customary for officials to send their sons, who had received basic literary education, to divan schools to learn secretarial skills. Here, students engaged with literature and developed intellectual interests. This account, recorded by Qazi Fazil al-Baysani—who later became a vizier in the Ayyubid state after serving as a high-ranking official under the Fatimids—is significant, as he himself had been admitted to the divan school by Ibn al-Khallal during the Fatimid period through a rigorous examination (Ibn Khallikan, 1948–1949, pp. 219–220). Admission exams were highly demanding, requiring sophisticated analytical reasoning. Baysani's examination included analyzing two incidents from *Hamasa*, converting selected poetry into prose, and, if necessary, performing similar exercises for an entire book (Ibn Khallikan, 1948–1949, p. 220). It is noteworthy that Baysani's father held a high-ranking position as the Qadi of Palestine, emphasizing the meritocratic nature of these examinations (Ibn Khallikan, 1948–1949, p. 224).

These observations suggest that the **medieval education system** was structured in two main tiers:

- **First tier (Talim):** Foundational education, comparable to contemporary secondary and undergraduate schooling. Graduates could serve as low-level officials, secretaries, hold religious positions, or work in various scientific disciplines.

- **Second tier (Suhba):** Advanced education, equivalent to modern master's and doctoral studies. Graduates of suhbha, considered highly qualified, could occupy top-level positions in state and religious institutions, including vizierates, judiciary, divan leadership, teaching, medicine, jurisprudence, librarianship, and diplomacy.

6. Academic Year Opening

The academic year in schools and madrasas was **formalized by the 11th century**, often marked by ceremonial events. This practice was partly motivated by ruling elites viewing such ceremonies as a symbol of prestige. Opening lectures were important not only for instructors but also for local qadis, judiciary officials, and scholars. Newly appointed teachers would deliver their **first lessons before large audiences**, often attended by representatives from all social strata (Makdisi, p. 235).

Scholars appointed to schools or madrasas could address **various topics or multiple issues within a single topic** during their inaugural lecture. Accordingly, the instructor had the authority to select the subject and deliver a lecture on it. Since the opening of the academic year was a ceremonial event, **various types of sweets were prepared in the courtyards of madrasas, mosques, and jami's**, which were then distributed to all educational institutions and charitable organizations in the city. The **number of attendees at the opening lecture** was simultaneously considered an indicator of the scholar's reputation and intellectual standing. A large audience signified the scholar's high scientific literacy and prestige, whereas a small audience suggested public indifference toward the instructor's expertise. If attendance was insufficient, it indicated that the teacher's professional activity might be ending; the

scholar could be reassigned, temporarily relieved of teaching, or granted additional time for self-improvement (Makdisi, p. 238).

Opening lectures also served as an **evaluation of instructors' skills**, teaching levels, approach to questions, and analytical abilities. The primary focus was to determine whether the scholar could express original ideas and introduce innovative approaches before the public. A hallmark of the educational system was the **critical engagement with texts**, emphasizing that teachers should not merely recite or propagate previous works (Makdisi, p. 247). In this system, students and their families effectively tested whether a scholar's knowledge was endorsed by the community. Considering that **all local scholars, jurists, state officials, and secretaries** attended these lectures, the evaluations were highly demanding. Some instructors attracted such attention that scholars and teachers from other regions also attended. The **most favorable periods for mass attendance** were during the Hajj season, suggesting that the academic year often began in months coinciding with Hajj (Keleş Mahmud Resep, 2016, 4(8), pp. 158–159).

Prominent scholars were sometimes **invited by administrators to teach at their madrasas**, and acceptance of such invitations could enhance the city's intellectual reputation. For example, in 1273, the vizier Parvana of the Anatolian Seljuk state invited the eminent Ilkhanid scholar Qutb al-Din Shirazi to the madrasa he had established in Kayseri, having witnessed his intellectual talent and moral stature in Sadr al-Din Qunawi's *Jami' al-Usul* lectures (Kaymaz N., Pervane Muinüddin Süleyman, 1970, p. 185).

This competition among madrasas, cities, and administrators meant that the arrival of a celebrated scholar could transform a city into a **major intellectual hub**, with far-reaching social, cultural, and economic implications. It could influence trade and pilgrimage routes, as caravans would redirect through the city. Ceremonial events provided both the instructor and the city's administration an opportunity to **promote their prestige**, and administrators often provided additional material and moral incentives to retain prominent scholars.

Medieval authors, particularly those writing autobiographies, often **planned travels** to witness the lectures of renowned scholars. If Ibn Maqkul, al-Samani, or Yaqut al-Hamawi visited Azerbaijan, their attendance reflected the influence of prominent instructors on their scholarly preparation. By the 11th century, there is evidence of increasing numbers of visiting scholars in Ganja, as reported by N. Aliyeva: "Some Arab-language authors traveled to the city, providing information about its mosque, library, educational institutions, hadith assemblies, and scholarly discussions" (N. Aliyeva, p. 31). Similar patterns can be observed in Tabriz, Shamakhi, Ardabil, and other cities.

7. Teachers and Students

In the medieval educational system, **hierarchies among teachers and students** varied according to their associated madrasas, schools, or kuttabs. Teacher rankings included:

- **Muid**
- **Mufid**
- **Mudarris or Darsiyam**

Student rankings included:

- **Talib-i 'Ulum (Sukhta, Softa)**
- **Danishmand**
- **Mulazim**

In addition to these ranks, both teachers and students could hold specific titles, such as **molla, 'allamah, qari, muhaddith, and faqih**. With the expansion of madrasa personnel and the improvement of the educational system, teacher rankings evolved. Each madrasa typically designated three instructors with ranks: **Ula (first), Saniyya (second), and Salisa (third)**.

As previously noted, **student education began around 14–15 years of age**. Children under this age were considered pupils attending basic schools. Students entering madrasa education at 14–15 typically attained a level of scholarly competence by 20–21, enabling them to debate, analyze topics independently, and lead student discussions (Anameriç Hakan, Rukancı Fatih, 2008, p. 40).

Educational Methodology

Education in madrasas relied primarily on a **deductive approach**, which was based on the teachings of scholars who had written works on specific subjects or expressed opinions on particular issues. This methodology involved **memorization (hifz), repetition, comprehension, discussion, and note-taking (daftar)**.

Memorization (Hifz) in Education

Memorization, or *hifz*, formed the foundation of the educational methodology. According to G. Makdisi, hifz "relied on the memorization of large amounts of material, its comprehension, and repeated review with intervals" (Makdisi, p. 241). Lessons in the Quran, lexicography, narration, jurisprudence (*fiqh*), and poetry were especially dependent on the student's memory. However, students with such exceptional memorization abilities were rare. For this reason, the scholar Shabi remarked, "If someone merely memorized what I have forgotten, they would be a scholar," highlighting the practical limits of memorization. Nonetheless, some students and scholars possessed extraordinary memory capacities; for instance, Makdisi reports that Khalaf al-Ahmar had memorized 40,000 couplets (Makdisi, p. 241).

Memorization was crucial in education. Al-Ghazali, after having his books looted during a journey, recalled having memorized all previously read works. Ziya al-Din Ibn al-Asir, who lived in the 12th–13th centuries, emphasized the importance of memorization, noting its necessity in particular contexts or times of need (Makdisi, p. 243).

Memory played a critical role in medieval education, especially in **jurisprudential rulings, hadith transmission**, and the dissemination of information in periods of limited written documentation. Linguist and historian Qazi Waki (d. 918) highlighted the importance of memorization in education:

"Students rise early in pursuit of knowledge,
This one day is immortalized in books,
I advance with enthusiasm and diligence,
The notebook is the heart, the ear a vessel" (Makdisi, p. 244).

Alongside memorization, **comprehension and discussion** were equally vital. These methods supported memorization by aiding retention of terms, words, and meanings. Discussion (*munazara*) was a primary technique, allowing students to interact with the instructor, who also evaluated students through questioning. On certain days, instructors held **public lectures**, during which students referenced memorized authorities to substantiate their arguments (Anameriç & Rukancı, 2008, p. 41).

Another essential tool in the educational methodology was **note-taking**. The *daftar*, a notebook, functioned as a repository of knowledge, assisting the reconstruction of memory. Note-taking was considered key to scholarly development (Makdisi, pp. 255–256). However, some scholars, such as Ibn al-Allaf (9th–10th century), expressed skepticism about relying on written knowledge, arguing in a lamentation:

"He entrusted knowledge to paper, and it was lost;Paper is a very poor place to preserve it" (Makdisi, p. 256).

While such criticisms existed, they do not diminish the fact that **millions of medieval literary works** were produced and preserved. A systematic approach to note-taking, called *fihrist*, provided concise summaries of sources and content. Al-Nadim's famous *Fihrist* exemplifies this methodology (En-Nedim Muhammad ibn Ishaq, 2017, p. 67).

8. Lessons and Textbooks

The establishment of the **Nizamiyya madrasa in 1067** as the de facto university of the Great Seljuks (1038–1157) marked a shift in education toward **transmitted (oral) sciences**. The emphasis on oral sciences aimed to reduce sectarian disputes in the Eastern Islamic world by channeling religious debates into educational institutions, leaving

scientific disagreements to scholars' judgment, and minimizing social unrest. Soon after, **rational sciences** were incorporated into madrasa curricula, broadening the academic foundation to include mathematics, medicine, astronomy, philosophy, rhetoric, arithmetic, geometry, lexicography, history, geography, grammar (*nahv*), and morphology (*sarf*) (Bilge Mustafa, 1984, pp. 41–43).

The Seljuks allowed each school of jurisprudence to develop its own curriculum and textbooks while also enabling graduates to serve in the state system. This educational reform helped **eliminate sectarian conflicts** that had fragmented the Eastern Islamic world during the 9th–10th centuries.

In the 11th–16th centuries, sufficient information exists regarding the **courses and textbooks** used in madrasas. In Azerbaijan, where Shafi'i, Hanafi, and Shia communities predominated, educational systems were adapted accordingly. Primary subjects included **Quran, Tafsir, Hadith, Fiqh, Usul al-Fiqh, Aqidah, Kalam, Rhetoric, Syntax and Morphology, Astronomy, Geometry, Arithmetic, and Philosophy**. Key textbooks included:

- Tafsirs: *Al-Kashshaf,* Qadi Bayzavi's Tafsir
- Sunni Hadith collections: *Kutubi Sitta*; Shia Hadith texts
- Fiqh: Abu Bakr al-Marginani, *Bidayat al-Mubtadi*
- Aqidah: Safar al-Hanafi, *Aqaid al-Tahawi*
- Usul al-Fiqh: Sadr al-Din Taftazani, *Talwih*
- Kalam: Nasir al-Din Tusi, *Tajrid al-Kalam*
- Rhetoric: Omar al-Abhari, *Isaqi*
- Astronomy: Muhammad al-Jaghmini al-Khwarazmi, *al-Mulakhkhas*
- Geometry: Shams al-Din Muhammad Samarqandi, *Ashkal al-Tasis*; Euclid, *Geometria*
- Arithmetic: Author unknown, *Risalat al-Bahaiyya*

Over time, both the **scope and academic depth** of subjects and textbooks expanded. During the Seljuk period, **Sufi studies** were incorporated into the curriculum. Works on Sufism by Shihab al-Din Umar Suhrawardi and 16th-century scholar Nematullah Nakhchivani, including mystical interpretations of the Quran, were also included among the textbooks.

9. Specialization and Curriculum in Madrasas

It should not be assumed that all madrasas offered identical courses or used the same textbooks. Similar to modern universities with multiple faculties and specialties, madrasas provided tailored curricula. Students in transmitted (oral) sciences were not taught natural sciences, and medical students did not study jurisprudence. For instance, the standard duration of study in medical madrasas was three years, during which students primarily studied the theoretical foundations of medicine.

In the **first year**, students studied:

- Hunayn ibn Ishaq, *al-Masail fi al-Tibb* and *Madhal fi al-Tibb*;
- Hippocrates, *Fusul al-Buqrāt* and *Ma 'ush-sha'ir*;
- Medical treatises of Nili Nishaburi.

These texts introduced students to the basics of medical science and shaped the identity of a practitioner.

In the **second year**, students studied:

- Al-Razi, *Kitab al-Tibb al-Mansuri*;
- Galen, *Sumeria Alexandrionorum* (16 articles) and *Tashrih-i Bozorg*;
- Sabit ibn Qurrah, *Zahira*;
- Abu Bakr Aswi, *Hidaya*;
- Ahmad Faraj, *Kifaya* or *Ahliya*;
- Sayyid Ismail ibn Hasan al-Jurjani, *Zahira-i Kharimshahi*;
- Sahli al-Masihi, *Sad Bab*.

In the **third year**, students studied:

- Al-Razi, *Kitab al-Khawi*;
- Ali ibn Abbas al-Majusi, *al-Kitab al-Malaki*;
- Ibn Sina, *al-Qanun fi al-Tibb* (Keykavus, Kabusname, 2003, pp. 178–179).

In addition to these, there were sixteen essential reference works frequently consulted by both students and physicians, including: *Kitab al-Firaq*, *Kitab al-Sina'a*, *Kitab ila Tusren fi al-Nabz*, *Kitab ila Aqlukan fi al-Ta'nni li Shifa'i-Amraz*, *Kitab al-Maqalat al-Khums fi al-Tashrih*, *Kitab al-Astukussat*, *Kitab al-Mizaj*, *Kitab al-Kuwa al-Tabiyya*, *Kitab al-Ilal wal-Amraz*, *Kitab Tuarrifu ilal al-Aza al-Batina*, *Kitab al-Nabz al-Kabir*, *Kitab al-Humeyyat*, *Kitab Ayyum al-Buhran*, *Kitab al-Buhran*, *Kitab Hilat al-Bar*, *Kitab Tadbir al-Asihha* (Kifti, 1903, p. 129).

The **practical phase of medical education** occurred in hospitals (*bimaristan*), where students applied theoretical knowledge and gained experience to qualify as physicians. During practical training, students acquired knowledge on patient psychology, hospital organization, hygiene, drug preparation, and the use of medicinal plants and minerals. A competent physician needed detailed knowledge of twelve categories of medicines, including syrups, jams, ointments, plasters, tablets, pastes, essences, decoctions, poultices, powders, opiates (panzahr), and pills (Mehmed, 2014, pp. 73–78).

From the Ilkhanid (1258–1359) and Timurid (1370–1507) periods, madrasas emphasized **astronomy, medicine, and mathematics** (Eshenkulova, 2001, pp. 99–148). The establishment of the world's largest observatory in Maragha during the Ilkhanid era demonstrates this commitment (Köprülü, 1942, pp. 208–227). Additionally, construction of the Shamb-i-Qazan and Rabi-Rashidi complexes in Tabriz during Qazan Khan's rule (1296–1304) further confirms this focus (Özgüdenli, 2003, I, pp. 105–126).

Orphanages and Education of Destitute Children

Destructive invasions and wars in the medieval period often caused humanitarian crises, including children orphaned by the loss of family heads. States took measures to care for these children, frequently entrusting them to **waqfs** or establishing orphanages. In medieval Azerbaijan, two state-supported orphanages are documented, both founded during the reign of Ilkhanid ruler Qazan Khan (1294/5–1304) within the Shamb-i-Qazan and Rabi-Rashidi complexes in Tabriz.

One orphanage within the Shamb-i-Qazan complex initially accommodated 100 children, later expanded to house street-found children. Annual expenses for care, clothing, food, and education were funded by the Shamb-i-Qazan waqf. Qazan Khan's decree also provided for children's festival allowances (*eydi*) and the salaries of caretakers. Children, beginning education around 4–5 years of age, were taught skills to secure employment later (Rashid al-Din, p. 212–213).

The Shamb-i-Qazan orphanage had a substantial financial foundation, with all expenses covered by revenues from Qazan Khan's lands (*incu*). A dedicated divan managed these resources, supervised by prominent Ilkhanid officials, including Kur Taymur and Taramtaza (Özgüdenli, p. 167). The orphanage continued to operate beyond Qazan Khan's reign, surviving into the Jalayirid period. Sheikh Uways (1356–1375) was honored in *Qazanname*, authored by Khaja Nur al-Din ibn Shams al-Din Muhammad al-Ajdari, for maintaining the institution.

The second orphanage, within the Rabi-Rashidi complex, officially housed ten orphans but served many more destitute children. Sources note residential quarters for officials, poor and indigent families (*dar al-masakin*), a kitchen, food storage, a mosque (*Masjid-i Jami-yi Shahristan*), market, mint, and garden. Similar to Shamb-i-Qazan, all expenses for care, clothing, food, education, and festival allowances were financed by the Rabi-Rashidi waqf (Özgüdenli, p. 176).

10. Scholarship System

The historical sources do not provide complete information on whether students in schools received a fixed monthly stipend. However, it is incorrect to generalize this assumption for all students, as the expenses of the madrasa system were primarily covered by **waqfs** (charitable endowments).

It is likely that students studying in schools and *kuttab* (elementary Quranic schools) had their expenses funded by waqfs. Nevertheless, it is incorrect to assume that the influence of waqfs extended to all settlements. In many villages and towns, educational expenses were covered through donations, gifts, and especially annual contributions from **zakat** and **khums** collections. During the medieval period (11th–16th centuries), despite occasional economic crises, 1 **dinar** per month was sufficient to cover a child's education. This is confirmed by records from Tabriz orphanage waqf documents (*Waqf-nama-yi Rabi-Rashidi*, 1350 AH, pp. 139, 163, 214).

In these records, 1 *Tabriz ra'ic-i dinar* weighed 3 **miskals** (12.96 g) of silver. Its purchasing power corresponded to 7.5 **mann** (6.2 kg) of meat, 36 **mann** (29.9 kg) of refined wheat, or 12 **mann** (9.9 kg) of chickpeas. In contemporary terms, the monthly stipend for a child would range between approximately **$30–33** (*Waqf-nama-yi Rabi-Rashidi*, 1350 AH, pp. 141–142, 165, 168, 230).

Children in orphanages also received stipends. In the 13th century, this stipend equaled one-third of a sheep's price; 15 months of stipend could purchase a cow. Additionally, daily allowances of 10 **mann** (8.3 kg) and annual 2,650 **mann** (3,041 kg) of wheat bread were allocated (*Waqf-nama-yi Rabi-Rashidi*, 1350 AH, pp. 135, 158). It is probable that these funds were provided to the child upon leaving the orphanage.

In madrasas, stipends were ten times higher. Abu Ja'far ibn Shirzad, who lived in the 10th century, reported receiving a monthly stipend of 10 dinars, while his elder brother received 20 dinars while studying at a divan school (*Makdisi*, p. 76). During the Seljuk and Ilkhanid periods, 10 dinars per month sufficed for a student's expenses, as evidenced by the salary of a low-level madrasa teacher (*mullah*) of the time (Najaf Akbar, 2010, p. 381).

Before the formal stipend system existed, students sometimes earned money through manuscript copying. For example, a student copied three copies of Ibn Sina's *Kitab al-Shifa* and received 100 dinars for each copy, using the total of 300 dinars to complete his education (Zakariya Qazvini, 1370, p. 287). Sübki, a medieval scholar and teacher, recounted a case in which a student, lacking money, was taken by his teacher to a merchant to borrow 50 dinars. During this episode, the student fell in love with the merchant's servant girl. Eventually, the student's father sent him 600 dinars, which covered the borrowed sum, the bride price, and possibly household expenses with his future wife (Sübki, 1323–1324, vol. III, p. 163).

This example illustrates that in the Seljuk period, a student could cover debts, education, and marital expenses with 600 dinars. In addition to monthly stipends, daily funds for bread and meat were allocated. During the Ilkhanid and Jalayirid periods, a student's monthly stipend in Tabriz ranged from 25 to 30 dinars (Özgüdenli, 2006, p. 231).

11. Teachers' Salaries

By the late 9th and early 10th centuries, the historian and jurist Abu Ja'far ibn Jarir al-Tabari reportedly earned a monthly salary of 10 dinars for teaching (Fayda Mustafa, 2010, vol. 39, p. 315). During the Seljuk and Ilkhanid periods, ordinary teachers without significant scholarly reputation earned similar amounts. During Sultan Tughrul

Bey's reign (1038–1063), Ali Tanukhi, a teacher in the madrasa, received 60 dinars per month (d. 1055). In the Ayyubid period, chief madrasa teachers (*mudarris*) received 30 dinars per month, while other teachers (*mullahs*) earned 10 dinars. During the Ilkhanid era, salaries in Tabriz madrasas ranged from 150 to 360 dinars, with some *mudarris* earning up to 500 dinars (*Waqif-nama*, p. 166).

In the Rabi-Rashidi complex, salaries of selected scholars and teachers were as follows (Özgüdenli, p. 217):

Position	Monthly Salary (dinars)
Instructor of Rational Sciences	500
Physician	300
Hadith Instructor	150
Librarian	150
Teacher	120
Surgeon	100
Ophthalmologist	100
Muid (Hadith commentator)	100
Atabek (teacher for orphans)	60
Medical Assistant	30
Library Assistant	30

12. Student Numbers in Madrasas and Classes

On average, a school had no fewer than 10 students, though the number of students in madrasas varied depending on the institution. For instance, the Nizamiyya madrasa had approximately 6,000 graduates (Najaf Akbar, p. 381).

Interest in the lectures of prominent scholars was consistently high. The medieval madrasa system did not have a class structure comparable to modern institutions. Teachers would sit at the center of the lecture room, with students and attendees arranged in a circular formation around them. For example, 300 students reportedly attended the lectures of the renowned scholar Juwayni daily, increasing to 400 near the end of his life. Not all attendees were students; some were fellow scholars (Subki, vol. III, pp. 252, 255, 259).

It is also recorded that students traveled from Andalusia (Spain) to attend the Maragha observatory, which at the time was considered the largest scientific center in the world. The Atabek and Qazi madrasas in Maragha attracted both scholars and students, supplemented by another madrasa built by Fazlullah Rashid al-Din, which accommodated students from various regions of the Islamic world (Kazimi, 2008, p. 13).

13. Libraries

Libraries with tens of thousands of volumes existed both independently and within madrasas or observatories. By the 9th century, a private library had been established in Hamadan, used by Abu Tamman, who noted that it belonged to Abu al-Wafa and included works such as *al-Hamasah* by Khatib Tabrizi, covering the works of 300 Arab poets (Kazimi, 2008, p. 13).

Yaqut al-Hamawi mentions the famous library in Ganja, Azerbaijan, which contained a rich collection of books in Arabic and Persian. These libraries were generally open to visitors, who could read, copy, or study the texts. Visiting

scholars received ink and pens, while resident scholars were salaried. Libraries also hosted scholarly debates and discussions (Aliyeva, p. 68). Similar libraries existed in Shamakhi, Tabriz, and other cities.

During the Seljuk period, Hamadan's *Tughruliyya* madrasa maintained a large library. According to Kazimi, the Seljuks and Arab caliphs built higher education institutions and mosques in Hamadan. Scholars working in these schools were highly respected, and the *Tughruliyya* madrasa was constructed with a substantial library (Kazimi, p. 17).

For the Maragha observatory, approximately 400,000 books were collected from Baghdad, Damascus, and al-Jazira (northern Iraq). Nasir al-Din Tusi personally traveled twice to Iraq and Baghdad to gather books (Köprülü, pp. 222–223).

During the Ilkhanid period, a dedicated library called *Bayt al-Kutub* was established within the Rabi-Rashidi complex, located near the administrators' residence and directly managed by the waqf officials. A librarian and a *munavil* oversaw its operations. Books could be borrowed for one month by depositing their value, or visitors could copy the texts on site. Many of Fazlullah Rashid al-Din's works were preserved in this library. The waqf records indicate that the library had a special catalog and books were sealed to prevent theft. The Rabi-Rashidi library reportedly contained 60,000 volumes (Richard, 1361, pp. 343–346; Özgüdenli, p. 231).

During the Seljuk era, Sultan Sanjar's vizier, Aziz al-Din Abu Bakr al-Zanjani, established the *Aziziya* library, which housed 12,000 volumes (Erünsal, 2003, vol. 27, p. 19). Large libraries continued to exist during the Kara-Koyunlu, Aq-Qoyunlu, and Safavid periods. According to Kazimi, rulers in the 14th–15th centuries established royal libraries, including the libraries of Jahanshah, Uzun Hasan, Sultan Khalil, and Sultan Yaqub. Other libraries in Tabriz included the Nasriya School and the Hamza Bey Aq-Qoyunlu School (Kazimi, p. 31).

During the reigns of Shah Ismail and Shah Tahmasib, the *Muzaffariyya* library operated, initially headed by the poet Ismail Kamal and later by Amir Fasih (Kazimi, p. 32). It is also recorded that the Sheikh Safi tomb complex in Ardabil had a library, which was later looted by the Russians (Özgüdenli, 2006, pp. 275–288).

14. Permissions and Diplomas

The term *ijazah*, literally meaning "permission," was used to denote a diploma or certificate of higher education. In the medieval education system, graduates of institutions received diplomas indicating their academic level, degree, and specialization. Diplomas typically included the student's name and *kunya* (patronymic), along with the names of their principal and secondary instructors.

Ijazahs emphasized the value of knowledge, often citing Qur'anic verses and Hadiths to illustrate the significance of learning. For example, many diplomas quoted Qur'an 2:31: *"Allah taught Adam all the names"*.

The general structure of an ijazah included:

- Praise of God;
- Praise of the Prophet Muhammad and his companions;
- Definition and value of knowledge;
- Significance of the ijazah;
- Names of students and teachers;
- List of studied books and learned disciplines;
- Scholarly lineage tracing back to Adam;
- Request for the student to remember the teachers and mention them in prayers (*wafa*);
- Recommendation for the graduate to teach;
- Signature, date, and seal.

15. The Educational Sphere of Medieval Azerbaijan: Traveling Students

From the 8th century onward, scholarly travel in the Muslim world created significant mobility across a vast geography, from Turkestan to Andalusia. Groups of knowledge seekers, sometimes forming caravans extending up

to 25 kilometers, included scholars, students, dervishes, and narrators. Numbering in the thousands or even tens of thousands, these individuals traveled from city to city, madrasa to madrasa, seeking books and teachers.

A central question in the intellectual world of this period was: *"Does knowledge reside in books, or in teachers?"* Interestingly, those devoted to the book whose first revealed verse was "Read!" concluded that teachers held the primary role. Contemporary scholars argued that since books cannot speak for themselves, human intermediaries—teachers—were essential to transmit knowledge, establishing the superiority of teachers. However, finding an accomplished scholar and learning directly from them was not the ultimate solution. Why was this the case?

By the 9th century, prominent urban centers distinguished themselves economically and politically while hosting diverse populations of different ethnicities and nationalities. The long *nisbahs* (attributive titles) attached to names—such as *al-Bardai*, *al-Nakhchivani*, *al-Arrani*, *al-Shirvani*, *al-Khorasani*, and *al-Bitlisi*—reflected these diverse origins. Many spent half their lives traveling for the pursuit of knowledge.

This article seeks to explore the motivations and structures underlying this phenomenon.

16. The Student

The term *student* derives from the Arabic word *talab* (seeking). From the 9th century onward, it became the general designation for knowledge seekers (*talib al-ilm*) in the Muslim East. Medieval Islamic pedagogy was fundamentally based on the dynamic interaction between teacher and student. Learning often required *rihla* (travel).

An illustrative example is the life of Khatib Tabrizi. Upon acquiring the three-volume work *Kitab al-Tazhib fi al-Lugha* by al-Azhari, Khatib consulted surrounding scholars to understand the intricacies of the language and concepts. To gain full mastery of his queries, he was advised to study with al-Abul-Ala, residing near Ma'arra in Aleppo. Due to financial constraints, Khatib could not afford to hire transport, so he packed his books, pen, and paper into a bag and traveled on foot to Ma'arra (Ay, 1998, p. 66).

Khatib Tabrizi (1028–1109) lived 81 years, and his dedication and perseverance in pursuit of knowledge earned him recognition as one of the greatest literary figures of his era. With numerous works on linguistics and grammar, he is considered the foremost literary scholar of the East (Nesirov, 2011, pp. 262–263). Medieval sources mention hundreds of scholars who, like Khatib, devoted their lives to learning.

The pursuit of knowledge was considered humanity's highest aspiration. By nature, humans develop through learning, and unlike other creatures, they possess both existential and societal needs. Human virtues are expressed through fulfilling these needs, and value is measured by cultivated manners and intellectual refinement. Islam opened the doors of knowledge, ethics, and education to all people. Prior to Islam, knowledge was often restricted to the elite; Prophet Muhammad democratized learning, establishing it as a common heritage, thereby dramatically stimulating intellectual activity.

17. Azerbaijan's Role in the Golden Age of the 9th Century

The 9th century is often regarded as the golden age of Islamic scholarship. With urban development in Muslim cities, scientific and literary networks expanded across the Islamic world. Azerbaijan played a significant role in this cultural flourishing. Cities such as Barda, Tabriz, Ganja, Ardabil, Maragha, Ani, Divin, Derbent, Shirvan, Nakhchivan, and Varsan not only participated actively in intellectual and literary activities but also produced hundreds of scholars and thinkers.

For example, Abu Sa'ad 'Abdulkarim ibn Muhammad al-Samani (1113–1167), a 12th-century scholar, recorded in his biographical work *Kitab al-Ansab* the names of 120 prominent Azerbaijani scholars of his era, reflecting the region's rich intellectual legacy (Aliyeva, 2010, pp. 91–133).

18. Classification of Knowledge

In light of these circumstances, Muslim scholars began to categorize knowledge into two main types:
a) **Imitative knowledge** (*taqlidi 'ilm*)
b) **Conservative knowledge** (*muhafizkari 'ilm*)

In the first category, the most accurate knowledge was attributed to the Prophet, and therefore, emulating him was considered the measure of correctness. Since the Prophet was regarded as the ultimate source of knowledge, his words and actions represented the highest standards for education. Consequently, his statements and practices were to be imitated faithfully.

In the second category, the knowledge acquired through imitation had to be preserved without alteration; otherwise, deviation from the correct path would be inevitable. Accordingly, the foundational activity of Muslim scholars in the pursuit of knowledge was the quest for the Prophet's teachings. Since direct physical contact with the Prophet was impossible, obtaining reliable reports (*akhbar*) and verifying their accuracy became the primary motivation for scholarly travel. Ata ibn Abi-Rabah (d. 733), the foremost teacher of the Hijaz legal school, defined knowledge for his students in these terms: what he called *'ilm* consisted of the *hadith* (reports concerning the Prophet), while what he termed *ra'y* consisted of the interpretations and explanations derived from these reports (Ibn Sad, 1909, V:345).

19. Scholarly Travel

Travel in the medieval period, as today, imposed substantial financial burdens. The pursuit of knowledge could double or even triple ordinary travel expenses, as students had to cover food, clothing, transportation, and the costs of books, writing materials, and animals for riding. Despite these challenges, medieval students were undeterred. They included children of wealthy families, those who sold inherited property to fund their education, individuals like Xatib Tabrizi who carried all his belongings on his back to travel on foot, and young adolescents like Sahl ibn Abdullah who set out on a journey upon encountering a question they could not answer. Similarly, Yahya ibn Yahya al-Lays traveled across Eastern lands at age 28 to study *al-Muwatta*, a branch of fiqh.

Not all aspiring students came from urban centers or attended prestigious madrasas. Al-Samani, while listing Azerbaijani scholars, mentions individuals such as *Ushnui*, *Barzandi*, *Zanjuni*, and *Sabehi*, whose places of origin ranged from villages to uncultivated regions, demonstrating that financial and geographical constraints did not prevent the pursuit of knowledge (Aliyeva, 2010:96, 115–116).

From the 9th century onward, traveling scholars adopted distinctive clothing styles, most notably garments with wide sleeves. These sleeves contained large pockets lined with fabric, which students used to carry books, writing tools, and notes (Houari, 2016:75, note 7).

Students traveled without restriction, following the teachers who could provide the knowledge they sought. For example, the renowned 12th-century jurist Taj al-Din Abu al-Hasan Ali, though born and raised in Ardabil, traveled extensively to study under Qutb al-Din Mahmud Shirazi and Shams al-Din ibn al-Mu'izz for hadith, Rukn al-Din al-Hadisi for language and fiqh, Nizam al-Din al-Tusi for rhetoric, Sayyid Burhan al-Din Ubaydullah for philosophy and logic, Ala al-Din Numan al-Kharazmi for khilaf, Kamal al-Din Hasan Isfarahi for arithmetic, geometry, and astronomy, Salah al-Din Mus for algebra, and Shaykh al-Islam Siraj al-Din Hamza for specific fiqh matters (Nesirov, 2011:119).

Similarly, Abu al-Abbas Ahmad ibn Muhammad of Duveyn (10th century), a prominent scholar of his time, traveled as a student as far as Egypt. Abu Ishaq Ibrahim ibn Ahmad, another notable scholar, visited cities across Iran, Iraq, the Hijaz, and Khorasan in pursuit of knowledge (Nesirov, 2011:171). In some cases, students studied at multiple madrasas within a single country. For instance, Kamal al-Din Masud from Shabran, a court physician under the Timurids, attended numerous madrasas in Herat such as Ikhlasiyya, Govharshad, and Qiyasiyya, eventually becoming a teacher himself (Nesirov, 2011:250).

20. Educational Costs and Student Life

The cost of scholarly travel varied depending on a student's financial resources, destinations, and the fields of knowledge pursued. Among eminent scholars, Abdullah ibn al-Mubarak (d. 797) reportedly spent 50,000 gold coins inherited from his father on education. Kharija ibn Musab, a student of Abu Hanifa, spent 100,000 silver coins on his studies (Houari, 2016:76).

Educational expenses included tuition, travel, accommodation, and other necessities. For example, a student who began primary studies in Barda and wished to specialize in fiqh would identify the best teacher in Baghdad and undertake the journey to study there. If dissatisfied with instruction or discovering a superior teacher elsewhere, the

student would relocate, often incurring significant costs. Ali ibn Asim (d. 816) spent 1,000 dinars traveling from Wasit to Kufa for his education (Houari, 2016:77).

For many students, financial hardship meant traveling on foot. Abu Khatef al-Razi (d. 890) recounted:

"My first journey lasted seven years. I walked over 1,000 farsakhs. From Bahrain, I reached Egypt, then on foot to Syria. From Ramallah to Sham, from Sham to Antioch, from Antioch to Tarsus. Returning to Homs, I took the road to Raqqa, then a boat to Iraq. I had not yet turned twenty. In Basra, I stayed for eight months in 829. To feed myself, I began selling my garments. With nothing left, I continued with my companion to seek a teacher... Only water remained, yet we persisted in study... At day's end, I was so weak from hunger that I could barely stand" (al-Razi, I:363–364).

Hunger was perhaps the greatest trial. Some students sold their possessions, including clothing, to continue their studies. The renowned hadith scholar al-Bukhari nearly died of starvation in his lodging after selling everything, and Ahmad ibn Hanbal recalled being unable to travel to Rey for education due to a lack of 50 dirhams (Houari, 2016:81). Similarly, al-Zahabi recounts a student in Egypt who, for seven months of study, never tasted warm food and endured extreme deprivation, illustrating the harsh realities of medieval scholarship (Zahabi, XIII:265).

Eye disease was also common due to late-night study, as noted by Khawari Tuati: "Eye illnesses were a shared affliction of medieval scholars" (Houari, 2016:85). Dissatisfaction with teachers was frequent, and students sometimes criticized instruction for being too brief or limited. In *Maqamat*, Hamadani recounts a student describing the hardships endured in pursuit of knowledge:"– How did you reach knowledge? – I began searching and realized it was difficult. To attain it, I slept on the ground, used a stone as a pillow, stayed awake at night, and traveled continuously" (Hamadani, 1957:109).

21. The Azerbaijani Educational Sphere in the Medieval Period

These accounts demonstrate the vast educational network of medieval Azerbaijan, which encompassed the broader Eastern Islamic world. From the 8th century, and peaking in the 9th century, this region cultivated a class of scholars known as *adibs*, whose literacy and expertise permeated all aspects of life, including trade.

The Adibs *Class*

Professional Category	Practitioners / Enthusiasts
Envoys	Astrologers
Entertainers	Printers / Copyists
Divan Secretaries	Calligraphers
Court Preachers	Physicians
Court Poets	Jurists / Scholars
Viziers	Merchants
Official Historians	Archivists / Record Keepers
Tutors	Teachers

Source: Makdisi, G. (2009). Human Sciences in the Classical Islamic Era and Christian West, translated by Hasan Tuncay Besoglu, Istanbul: Klasik Yayınları, p. 280.

The integration of scholarly foundations into society led to the emergence of the *udeba*, a new societal model shaped by knowledge and cultural refinement. From the 10th century onward, Azerbaijani and wider Muslim societies

developed guilds, fraternities, and artisan associations under names such as *sinaat al-adab* and *khirfat al-adab*, reflecting the influence of exemplary *adib* figures (Makdisi, 2009:280).

The link between travel and knowledge fostered the development of new scientific disciplines. Muslim geography and historical sciences (*akhbar*) emerged as direct outcomes of scholarly journeys. The *rihla* (travel) literature became a primary source for geographic knowledge, with numerous works composed in this period. Observation-based scholarship, exemplified by al-Jahiz (d. 868), contributed to the recognition of empirical observation as a means of acquiring positive knowledge (Houari, 2016:98).

The pedagogical approach of travel, observation, and compilation encouraged scholars to disseminate their accumulated knowledge. Frederick S. Starr describes this process in *Lost Enlightenment*:

"The concept of a traveling scholar took deep root in medieval Europe, yet scholars were generally expected to remain in their hometowns or monastic institutions. In Asia, the situation was different. Following Greek philosophers after 300 BCE, the influx of Indian scholars, Jewish astrologers, Manichean sages, and Nestorian monks prompted reciprocal journeys. Centuries before Caliph al-Ma'mun established his library and research center, physical mobility, underpinned by idealism and opportunism, was integral to the life and thought of Central Asian peoples" (Starr, 2017:189).

By the 9th century, Azerbaijan's central location within a vast educational network positioned it as a bridge of knowledge. With the rise of the caliphate system, the region became a focal point for scholarly activity from the 11th century onward. From the 12th century, cities such as Tabriz, Nakhchivan, Ganja, and Shamakhi emerged as cultural and intellectual centers, laying the groundwork for Azerbaijan's continued responsiveness to modern scientific and cultural influences relative

22. Conclusion

In the medieval period, the Azerbaijani education system functioned as an integral part of a broad socio-cultural and commercial network. As examined in the preceding sections, each aspect of education was closely linked to economic and social spheres. The education system stimulated the development of various trades, including book production, binding, leatherworking, ink and inkwell manufacturing, pen-making, and paper trade. Additionally, the emergence and growth of crafts such as bookbinding, printing, calligraphy, and pen-making were closely tied to educational practices and standards.

Moreover, medieval Azerbaijani education was not limited to local contexts but formed a vital component of an extensive educational network spanning a wide geographic area. From the 11th to the 17th centuries, Azerbaijan served as a central hub within this system, playing a key role in shaping scholarly, cultural, and intellectual life in the region. The historical interplay between education, craftsmanship, commerce, and social development highlights the profound and multifaceted impact of education on medieval Azerbaijani society.

23. Acknowledgements

The authors would like to express their sincere gratitude to the institutions and individuals who contributed to the development of this research. Special thanks are extended to the archives, libraries, and digital repositories that provided access to primary and secondary sources on medieval Azerbaijani education. We also acknowledge the valuable insights and support of our colleagues and reviewers who helped improve the clarity and scholarly rigor of this study.

24. **Conflict of Interest.** The authors declare that there is no conflict of interest regarding the publication of this article. All opinions expressed in this work are solely those of the authors and do not necessarily reflect the views of any affiliated institutions.

Endnotes

1. *Kitab al-Zahra*, or *The Book of Flowers*, is a type of poetry anthology. Muhammad ibn Dawud compiled the selected poems in prose form.

2. This work, together with *Mushkat al-Musahib*, was published in Russian in Saint Petersburg in 1898–1899.

3. Individuals participating in discussions at madrasas, at the level of the instructors' assistants, were given a specific title. In some madrasas, it was also used for those supervising a specific class without having the full authority to teach. A *Muid* acted as an intermediary between the instructor and the student. This role is roughly equivalent to a modern-day "assistant."

4. Generally used starting in the 15th–16th centuries, this term referred to teachers ranked one level above a *Muid* and one level below a *Mudarris*, equivalent today to an "associate professor." *Mufids* analyzed and explained lessons at madrasas that the instructor had taught but that students had not fully mastered.

5. *Mudarris* or *Dersiam* referred to a teacher with the full right to give lessons at a madrasa. *Mudarris* were fully knowledgeable scholars, holding the highest academic rank within the education system.

6. *Softa* was a term used among the public for madrasa students. According to madrasa teachers, children passionately pursuing knowledge were mockingly referred to as "suxtə" by the people, which later evolved into *softa*.

7. *Danishmand* is an adjective for individuals who have completed madrasa education. Derived from Persian, the term spread rapidly after the Ilkhanid period. Students called *danishmand* were considered "knowledgeable" or "scholars."

8. A student who completed madrasa education and received *ijazah* (diploma) was given a specific title.

9. For information on the religious composition of the people living in Azerbaijan during the Seljuk period, see: Nəcəf, *Aran Atabəyləri*, pp. 287–294.

10. This work is very important as the first book covering all fields of logic taught in madrasas. Due to its original approaches to topics and events, it attracted attention in Europe and was even translated into Latin at an early date.

11. For extensive information on lessons and textbooks, see: İzgi, C. (1997). *Osmanlı Medreselerinde İlim II*. Istanbul: İz Yayınları.

12. During this period, children being abandoned in the streets of Tabriz is confirmed by Rashid al-Din: "*afil ki, bərāh mi-azdāzəd, işān rā bərgirənd.*" See: Raşideddin Fadlullah-i Hemedani, *Tarikh-i-Mubarak-i-Ghazani* (transl. & ed. K. Jahn, London, 1940), p. 213.

13. *Inju*—during the Ilkhanid period, a special property (land, estate, etc.) allocated to the ruler and the ruler's family. See: Özgedenli, O. G., *İncu*, in *DİA* (Diyanet İşleri Bakanlığı İslam Ansiklopedisi), Vol. XXII, p. 281.

14. For more on this work, see: Browne, E. G., *A Descriptive Catalogue of the Oriental Manuscripts Belonging to the Late E.G. Browne* (ed. R. A. Nicholson, Cambridge, 1932), pp. 231–236.

15. According to Özgedenli, a child leaving an orphanage had to master a trade. See: *Two Orphanages in Tabriz*, p. 178.

16. Unfortunately, only *ijazah* (diploma) documents from the late Ottoman period are available. One such document is preserved at the Manisa Provincial Library, Republic of Turkey, No: 1004-8b.

Keywords	College students; Social media; Hashtags; Behavioral motives; Media preference

Abstract

Background and Actuality:

Social media has become an integral part of college students' daily lives, not only serving as a tool for entertainment and communication but also shaping information-seeking behaviors, identity construction, and media preferences. Within this context, the hashtag function has emerged as a crucial mechanism for organizing digital content, enhancing engagement, and amplifying online discourse. Despite its widespread use, limited research has addressed the psychological motives driving college students' adoption of hashtags and their resulting media preferences.

Methods and Data:

This study employed a mixed-methods design combining quantitative surveys (n = 512 college students in Shanghai) with AI-assisted interaction analysis of hashtag use across WeChat, Weibo, and QQ. The survey measured behavioral motivations including information-seeking, social interaction, entertainment, and self-expression, while the AI model examined frequency, context, and engagement patterns of hashtag adoption.

Results:

Findings indicate that WeChat, Weibo, and QQ remain the dominant social platforms among college students. Hashtags are widely perceived as effective for information retrieval, community building, and communication tasks. Behavioral motives strongly predicted platform choice and hashtag use: students driven by information-seeking and social interaction engaged more consistently with hashtags, while entertainment-driven use was more platform-specific.

Conclusions:

The results highlight the centrality of hashtags in shaping media bias and preference formation among youth. By linking psychological motives to functional use of hashtags, the study expands understanding of social media psychology and offers implications for educators, policymakers, and digital platform designers seeking to foster meaningful and responsible online engagement.

1. Introduction

With the continuous popularization of the Internet, the number of Internet users in China has also increased. According to the statistical report released in 2020, as of March 2020, the number of Internet users in China has reached 904 million, an increase of 75.08 million compared with that in 2018. Among them, the number of mobile Internet users reached 897 million, accounting for 99.3%. Especially during the outbreak, the opening of schools nationwide is delayed, and teaching activities are adjusted from offline to online, which also push the rapid growth of online education users. Moreover, Chinese government agencies have opened media platform accounts to enhance interaction with the public with the help of new media. According to relevant data, during the outbreak, the number of government's new Tiktok accountsis 17380, the number of new Toutiao accounts is 82937, and number of new microblog accounts is 139000[1].

Social media is a form of mass media. With the continuous development of society, social media has gradually penetrated into people's media life, which allows users to create and communicate. At present, people often use microblog, blog, community website, QQ, Wechat, etc., which are typical social media. People can realize the expression and exchange of views with the outside world, as well as the acquisition and dissemination of information by using them, which makes Internet users feel free and convenient, so it also attracts a large number of college students' netizens[2]. Social media can be divided into narrow sense and broad sense. In a broad sense, social media refers to channels that can promote communication and form interpersonal relationships, while in a narrow sense, it is a media platform developed based on Web 2.0. The "Hashtag" function is mainly used to initiate and discuss the main body of the line management. Especially in recent years, "Hashtag" function has become an important way of college students' social dialogue[3].

Therefore, considering the special significance of the "Hashtag" function of social media and college students as an important group of Internet users, it is of great significance to study their use of "Hashtag" and media bias in social media, so as to further obtain college students' preference for "Hashtag" and social media.

2. Literature Review

Social media is becoming more and more important in people's life. Whether it is communication or sharing, it has become an important part of people's daily activities. Swart et al. (2018) pointed out that social media plays the role of communication in the daily environment, and people's understanding of the frequency, content preference and network settings of some information on the communication media is more based on social experience, and there is a certain gap between whether news topics can promote dialogue. They investigated how people participate collectively in current events and related follow-up, sharing and discussion practices in different social forms. The results show that members of social groups have weak ties and tend to news centers. In addition, privacy needs to be considered, and norms and social boundaries should be clarified[4].Zappavigna and Martin (2017) pointed out that social metadata is an important dimension of social media communication, which is closely related to the practice of planning, topic and search content. In social media, participants do not necessarily have direct contact, and they can make alliances and negotiations through social topics[5].

Hilpert and Marchand (2018) pointed out that the philosophical and theoretical sources of complex system research organized by complex, dynamic and emerging ontological features are useful and appropriate for psychology[6]. McCrudden and Marchand (2020) discussed and analyzed the application of M3, and analyzed the five purposes of mixed method research, and illustrated how M3 was used for mixed method research. Through the description of three key assumptions and examples, it shows how to shape a person, and shares some experiences and lessons[7].

Zawacki-Richter et al. (2019) pointed out that the application of artificial intelligence in the field of education is one of the emerging fields of current education technology, and artificial intelligence in education can be applied in the field of education services, but there are also certain risks. At the same time, due to the weak connection between artificial intelligence education and theoretical education perspective, it is necessary to further explore the ethics and educational methods of the application of artificial intelligence education in higher education[8].Edwards et al. (2019) used the social actor paradigm to expand the prediction of social identity theory to human-computer interaction in teaching and communication, and pointed out that older students give higher evaluation on the reliability and social existence of older artificial intelligence speech instructors, and reported that they have more learning motivation than students with lower age identity, and discussed the design features of computerized sound[9].

To sum up, in previous studies, the use of "Hashtag" function of social media is mostly focused on social media communication, while the research on college students' psychology is relatively single. Therefore, when the use of "Hashtag" function of social media is considered, college students' psychological behavior motivation and artificial intelligence technology are added to study the use of social media by college students.

3. Methods

3.1Hashtag function in social media

Hashtag system can be classified into two categories in terms of functions: social function and media function. Certainly, there is no clear-cut boundary between these two functions[10-12]. The hashtag function of social media is reflected in the topic interaction functions, such as Share, Follow, Forward, Like, Reward, and Up. Users can interact about specific topics via hashtags. Meanwhile, the introduction of the "#" sign provide a strong function to aggregate same-topic posts. The hashtag function enables social media users to act actively. In other words, users are not only passive readers but also contributors in social media. Recently, the hashtag function has drawn increasing attention and has been widely use in practice[13].

The study consists of three phases. In the first phase (from 2013 to 2014), we surveyed and interviewed selected sample of college students about their use of social media. We find that the use of social media technologies results in various social problems. For example, some college students exhibit two drastically different personalities in the real life and in social media, indicating a social anxiety disorder phenomenon[14-16]. In the second phase (from 2015 to 2016), we distributed an online survey again to college students and further investigated part of items in the first survey. Moreover, the use of different social media is examined separately. In the third phase (2017-2018), we further included the investigation of new applications in social media such as short videos and fundraising. The entire study spans for six years and enables us to study the changes of hashtag use and platform selection preferences[17-20].

Respondents are mainly from Henan and Shanghai. Questionnairewere distributed in WeChat Moment with the snowballing approach and filled voluntarily. Each questionnaire collecting period lasted for one month. Invalid data are removed. The final sample consists of 1,342 responses[21.22]. The region distribution is shown in Figure 1.

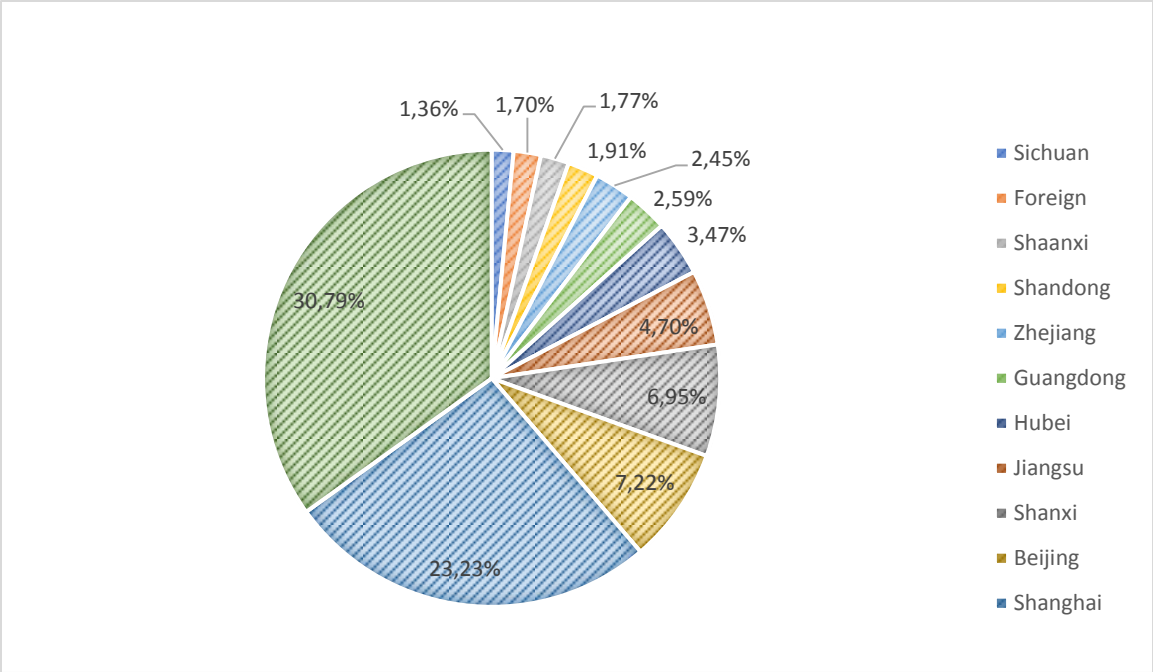

Figure 1: Region distribution of the sample

3.2Major social media and the characteristics of the hashtag function

Based on the function characteristics, hashtag systems can be classified into opensystem, semi-open system, and closed system. The corresponding social media and keyfunction of each system are summarized in Table 1[23-25].

Table 1: Major social media and the characteristics of the hashtag function

Hashtag system category			Major social media platforms in China	Major social media platforms in other countries	Major functions
Openness	Category				
Semi-open system	Forums		Tianya BBS, Mop BBS, BaibaTieba	Yahoo(Message Boards)	Posting and Community
	Vertical community	Category based on Interests	Reading, movies: Douban, LOFTER Pictures: Duitang, Babidou, Bababian, Lofter Videos: Youku, Tudou, Ku6	Instagram pinterest Youtube	Professional comments on a certain field. Information search and sharing
		Categories based on users	Gagamatch, Badoo International socialization: Tingdong, Gagamatch, WeLiveInChina, Badoo Workplace	Linkedin	Language and culture communication

			socialization: 52rbl, Ushi, LinkedIn		
	Collaborative publication	Q&A	Zhuhu, Tianya Wenda, Baidu Knows, Fenda, Zaihang	Quora	Professional answers (mainly about science and technologies)
		Encyclopedia	Hudong, Baidu, Baike	Wiki	User edit, collaborative publication
Open system	We Media	Long-post we media	Qzone, Sina Blog, 163Blog, WeChat	Blogging	Personal log and articles
		Short-post we media	Fanfou, SIna Weibo, Tecent Weibo, Sohu Weibo, Qzone	Twitter, Digg	Personal information posting and information sharing
Closed system	Instant message		QQ, AliTrademanager, WeChat, Easychat, MiTalk, Momo, YY	WhatsApp、MSN、Skype	Online messaging, online chatting
	Social networking service		Renren, Kaixin001, Pengyou, Facebowl	Facebook	Social networking and sharing

College students are generally aware of the importance of social media, with 50.3% of students recognizing its importance, and 22.95% of students think that social media is very important. The time spent by college students on social media is statistically analyzed. Figure 2 shows the data result.

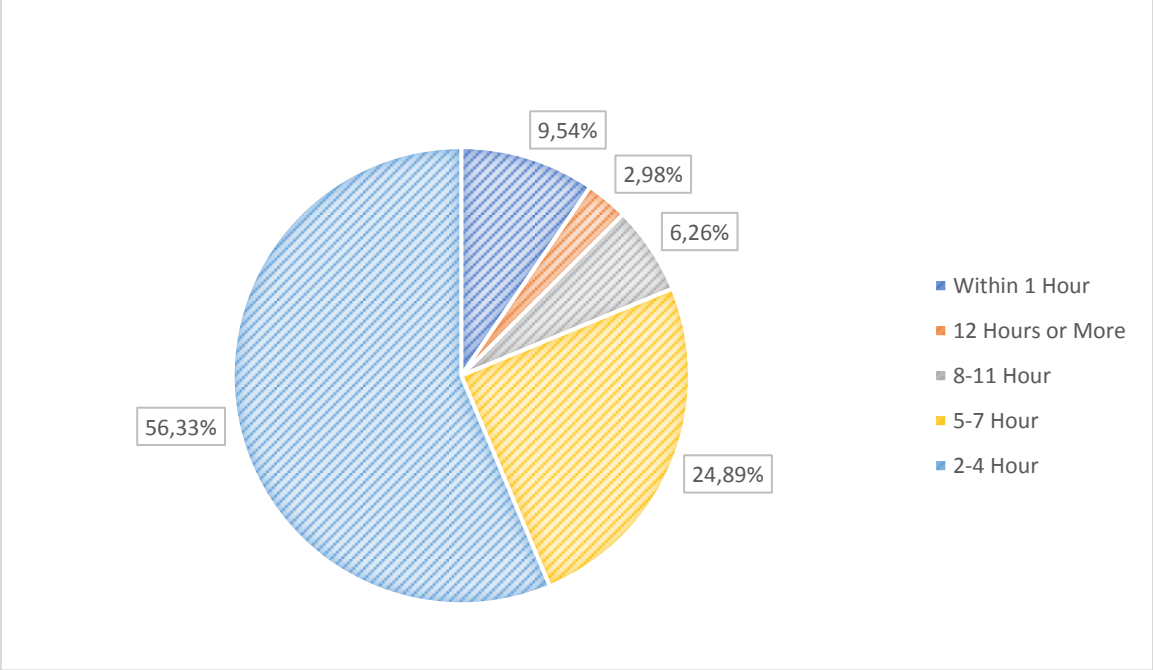

Figure 2: Time spent on social media

From the above survey results, it is found that50.3% of students select "important" and 22.95% of students select "very important". Over 90% of respondents spend more than two hours on social media every day. Specifically, 53.33% of respondents select "2-4 hours", followed by "5-7 hours" (24.89%), "8-11 hours" 6.25%, and "more than 12 hours" (2.98%). In addition, college students have a strong social media dependency and the use of social media account for a large portion of their leisure time. Nearly half of the students use social media after 10 pm.

3.3 Social media preferences

College students mainly use social media on mobile devices. For all social media applications, mobile devices account for more than 84%.According to the statistics of social platforms used by college students, the results of Figure 3 are obtained.

General Options	Subtotal	Percent
QQ	1266	94.34%
Wehchat	1269	94.56%
Weibo	1152	85.84%
Baidu Tieba	712	53.06%
Fetion	575	42.85%
Tianya BBS	153	11.4%
Zhihu	351	26.15%
YY	295	21.98%
Momo	160	11.92%
Twitter	101	7.53%
Douban	305	22.73%
Laiwang	31	2.31%
Renren	501	37.33%
Facebook	162	12.07%
Line	116	8.64%
Others	30	2.24%
Effective people	1342	

Figure 3 reports all social media platforms that have ever been used by sample students.

The above results show that WeChat, QQ, Weibo, Baidu Tieba are the most popular social media platforms used by college students: 94.34% of the students have used QQ, 94.56% of the students have used WeChat, and 85.84% of the students have used Weibo.After that, students are asked to select the three most commonly used social media platforms from the above contents, and then the results in Figure 4 are obtained.

General Options	Subtotal	Percent
QQ	1132	84.35%
Wehchat	1269	94.56%
Weibo	1038	77.35%
Baidu Tieba	128	9.54%
Fetion	27	2.01%
Tianya BBS	19	1.42%
Zhihu	72	5.37%
YY	26	1.94%
Momo	8	0.6%
Twitter	4	0.3%
Douban	26	1.94%
Laiwang	1	0.07%
Renren	13	0.97%
Facebook	16	1.19%
Line	2	0.15%
Others	10	0.75%
Effective people	1342	

Figure 4: Use frequency of social media platforms

Figures 3 and 4 show that in the first stage of the survey, Fetion and Renren are more popular among college students. This is because from 2009 to 2013, Fetion and Renren developed better, bringing more information and creating certain convenience for college students.42.85% of student have used Fetion and 37.33% of students have used Renren.After that, with the continuous development of Wechat, the number of users of Fetion and Renren decreases gradually. By 2017, only 0.97% of the students often used Renren, but the number of people using Wechat reached 98.42%. The proportion of using QQ reached 87.31%, and the proportion of using microblog reached 84.45%.At present, Fetion, Renren and other social media platforms have almost disappeared, and their users have gradually migrated to Wechat and microblog. This is because users cannot manage multiple social media platforms at the same time, and the relevant data cannot be transferred to another platform.Therefore, the emergence of new competitors may cause users to migrate and other huge changes.

4. Results and Discussion

4.1 Multiple purposes of social media use: social and information needs

The problem of college students' preference to use social media is analyzed. It is found that college students have more preferences and different purposes of using social media,as shown in Figure 5.

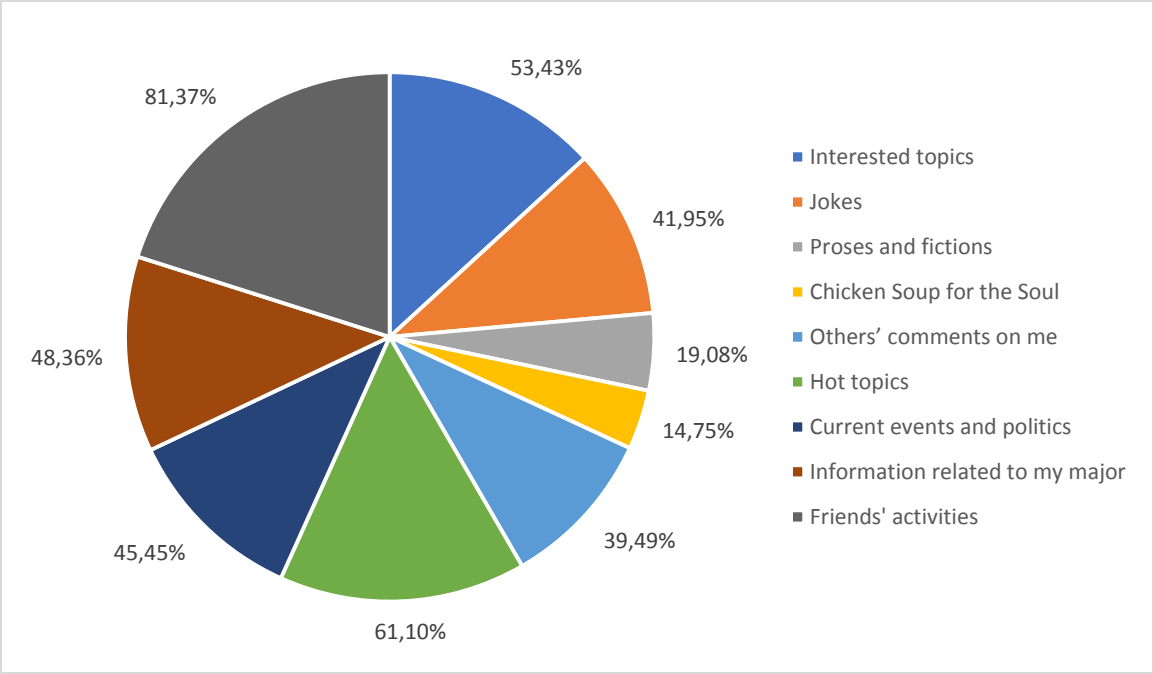

Figure 5: College students' purpose of social media use

Figure 5 shows that the purposes of college students' social media use are multiple. However, two main purposes are checking others' posts and hot topics. 81.37% of sample students select "others' posts" and 61.1% of students select "hot topics". Respondents who read "chicken soup for the soul" articles that are most widespread in social media only account for 14.75%. 53.43% of college students use social media to read contents they are interested in. Further interviews suggest that the categories of contents student are most interested in include comics and animations, videos games, and recruitment information.

4.2Key determinant of forwarding posts: insightful

The problem of college students' preference for using social media is analyzed. It is found that college students have more preferences and different purposes of using social media,as shown in Figure 6:

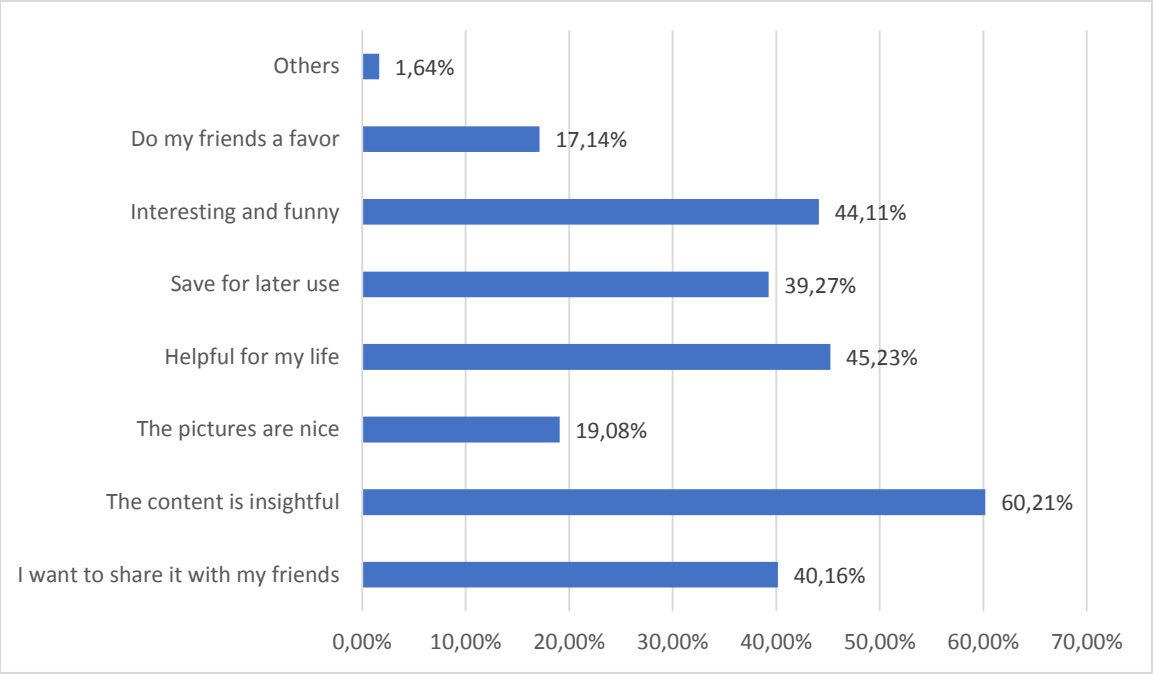

Figure 6: Determinant of forwarding for college students.

Figure 6 shows that the primary reason for college students to forward a post is: the content is insightful (60.21%). For college students, the quality of articles in social media is still the most important reason for students to forward contents and participate in a topic. The other two reasons for forwarding are "helpful for my life" (45.23%) and "interesting and funny" (44.11%). Therefore, whether the contents are of practical value and entertaining is also crucial determinants for forwarding and interactions.

4.3 The motives of function preference for social media platforms

When college students use social media, the use of "Hashtag" function is to deeply understand the content and discuss the important work. Especially in the use of microblog, "Hashtag" function is used more frequently. Figure 7 shows the reason for use.

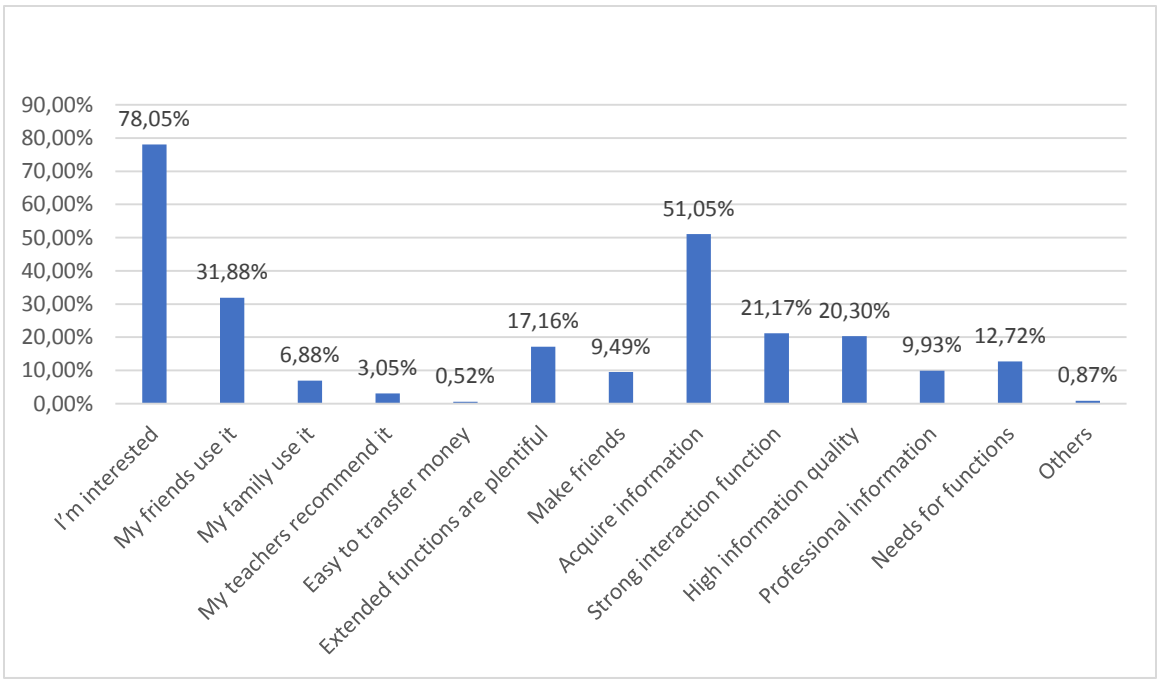

Figure 7: The reasons for college students to use Weibo

Figure 7 shows that the major reasons for college students to use Weibo include "I'm interested" (78.05%) and "acquire information" (51.05%). About 30% of respondents use Weibo because their friends use it (31.88%). The results in Figure 7 suggest that the social networking role of Weibo is more important than its informational role.

In addition, the use of "Hashtag" function by college students is also analyzed. Figure 8 shows the results.

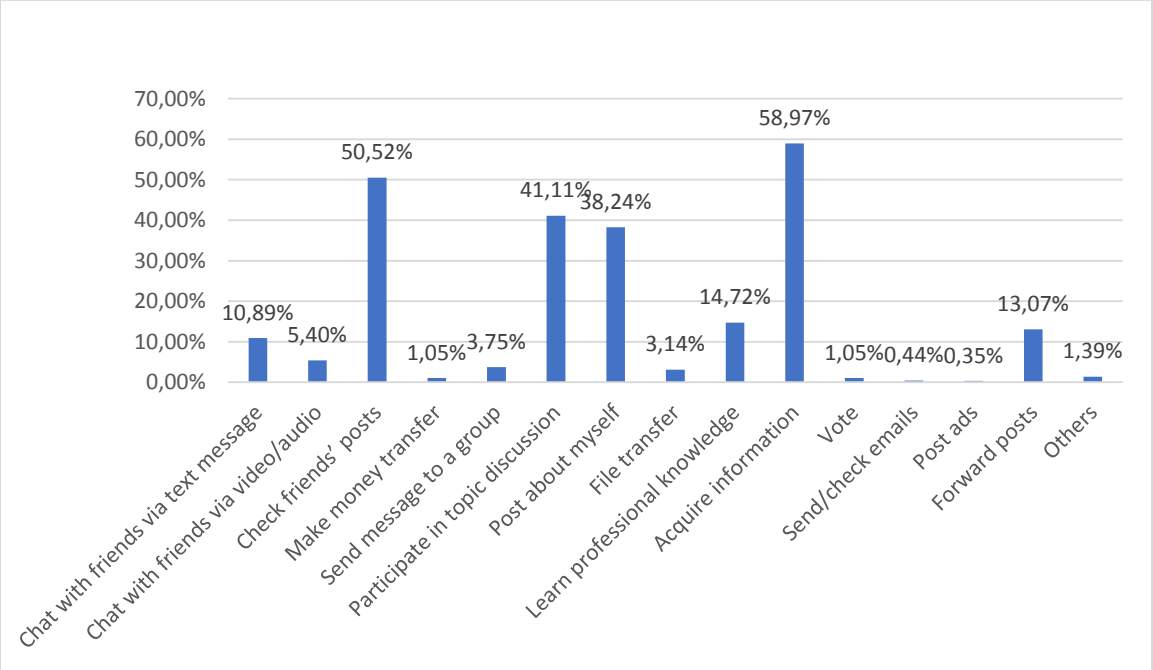

Figure 8: Most used functions for Weibo

Figure 8 shows that the most used hashtag function of Weibo is information acquisition—a media function, accounting for 58.97%, followed by checking friends' posts (50.52%) —a social networking function and participation in top discussion (41.11%)—a mixed function.

On this basis, news topics are analyzed, that is, when there is a sudden news, the social platform that it appears first is investigated.

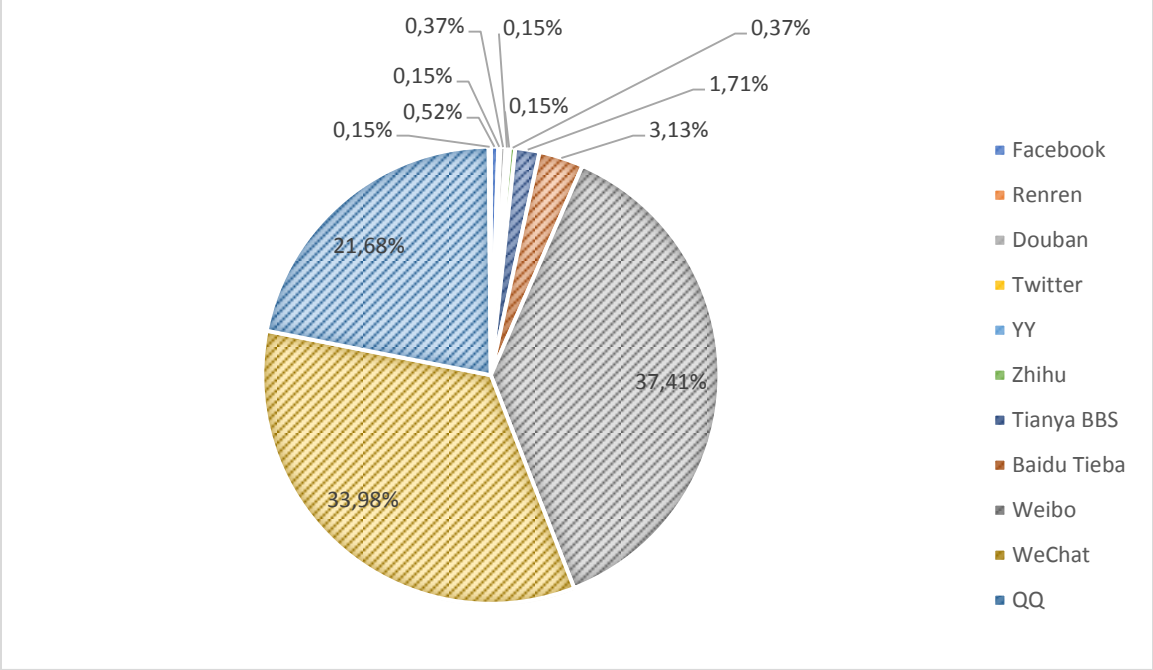

Figure 9: Distribution of preferred social media platform to reveal breaking news

Figure 9 shows that when there is a sudden news, 37.41% of them first publish on Weibo, 33.98% on Wechat and 21.68% on QQ.

4.4 Application of artificial intelligence in social media "Hashtag" tracking

When college students use social media, the human-computer interaction of artificial intelligence technology is applied to the "Hashtag" tracking of social media. When users input topic content into the human-computer interaction system, the system can match the input information with the background database, and then provide the topic content with high matching degree for users to watch and discuss [26-29].

More college students have a certain understanding of human-computer interaction. No matter what the scene, human-computer interaction can make students feel convenient through the screen, and it is also convenient for people's life. At the same time, on the basis of understanding the content of "Hashtag", college students can extend and expand to social skills through artificial technology, which will affect the interpersonal communication efficiency and content communication quality of college students, and also affect the bias of social media [30-32].

4.5Social media preferences

When the usage of QQ, Wechat and Baidu Tieba is analyzed,the reason and function distribution are analyzed. Figures 10 and 11 show the corresponding results.

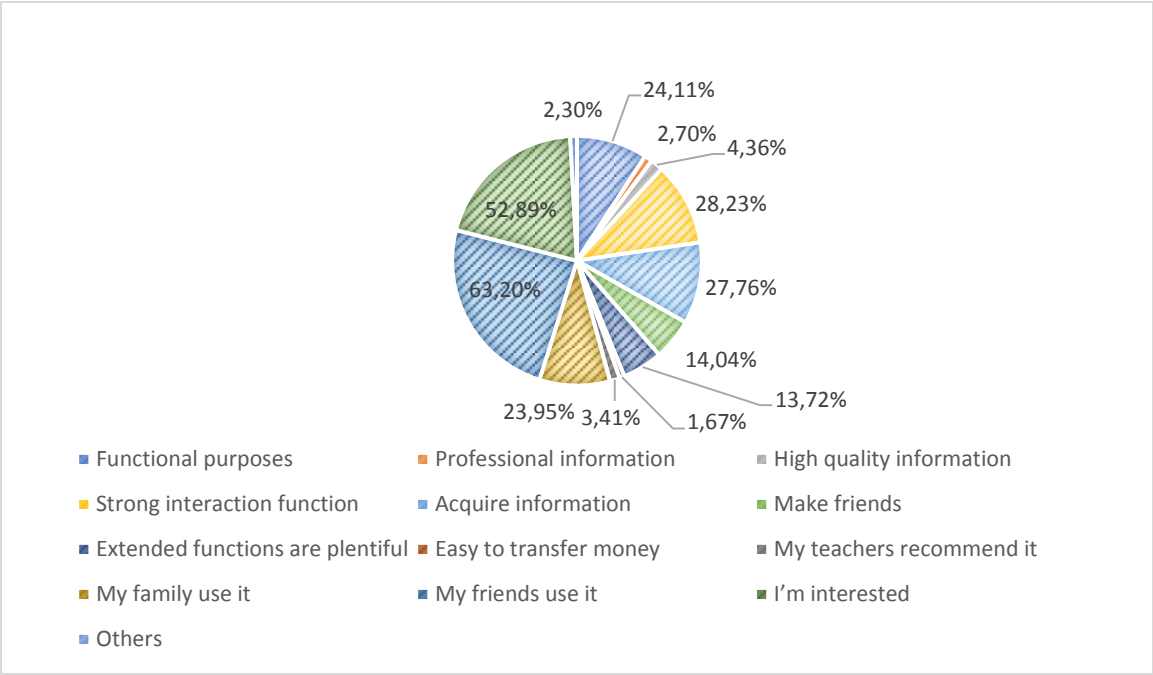

Figure 10: The distribution of the reasons to use QQ

Figure 10 shows that the reasons to use QQ reflects strong customer stickiness. The top reason is "my friends use it" (63.2%). "I'm interested" accounts for 52.89%. "my family use it" accounts for 23.95%. Only less than 30% of respondents use QQ because of information related reasons.At the same time, the function of QQ topic tag is analyzed. Figure 11 shows the usage distribution.

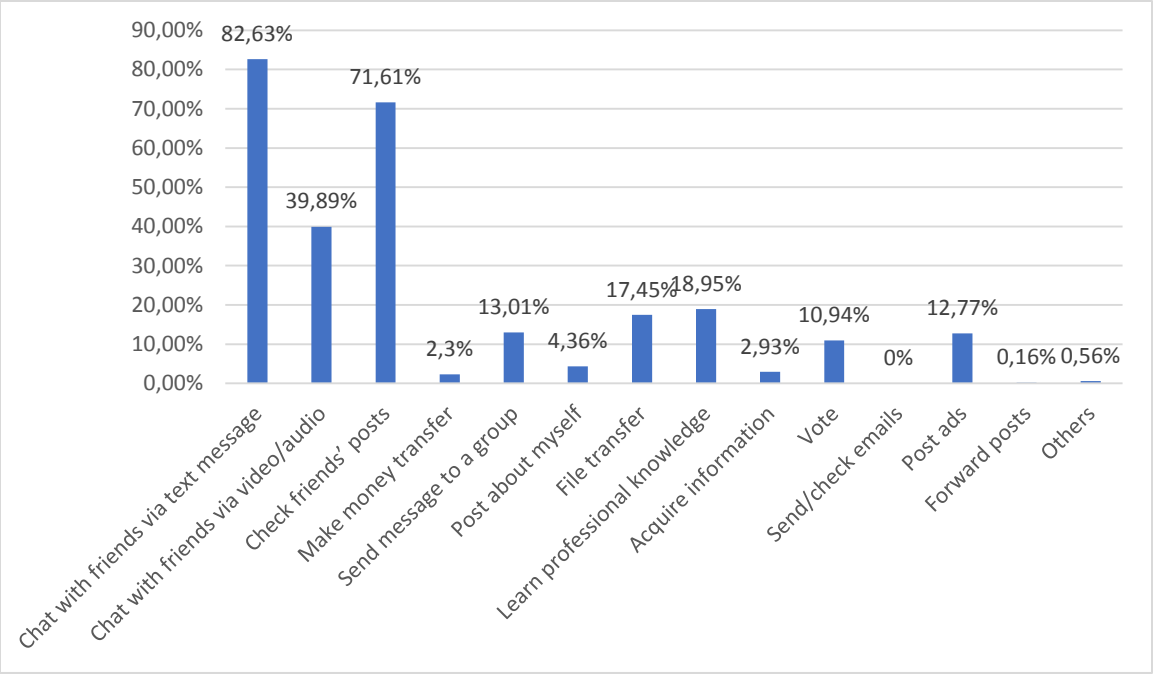

Figure 11: The distribution of QQ function use

Among the hashtag functions in QQ, text chatting is the most used (82.63%) function, followed by "check friends' posts" (71.61%). QQ video function accounts for 39.89%. Other frequently used functions include file transfer (18.95%) and "post a status" (17.45%). The social networking genes of Tencent has made QQ the most easy-to-use social networking tool. The 2017 survey results indicate that 73.21% of college students use QQ as their workplace social media tool. Recently, there is a growing trend toward the workplace use of QQ.

When the function distribution of Wechat is analyzed, it is found that the use of Wechat topic function mainly focuses on social network and financial transaction function, as shown in Figure 12.

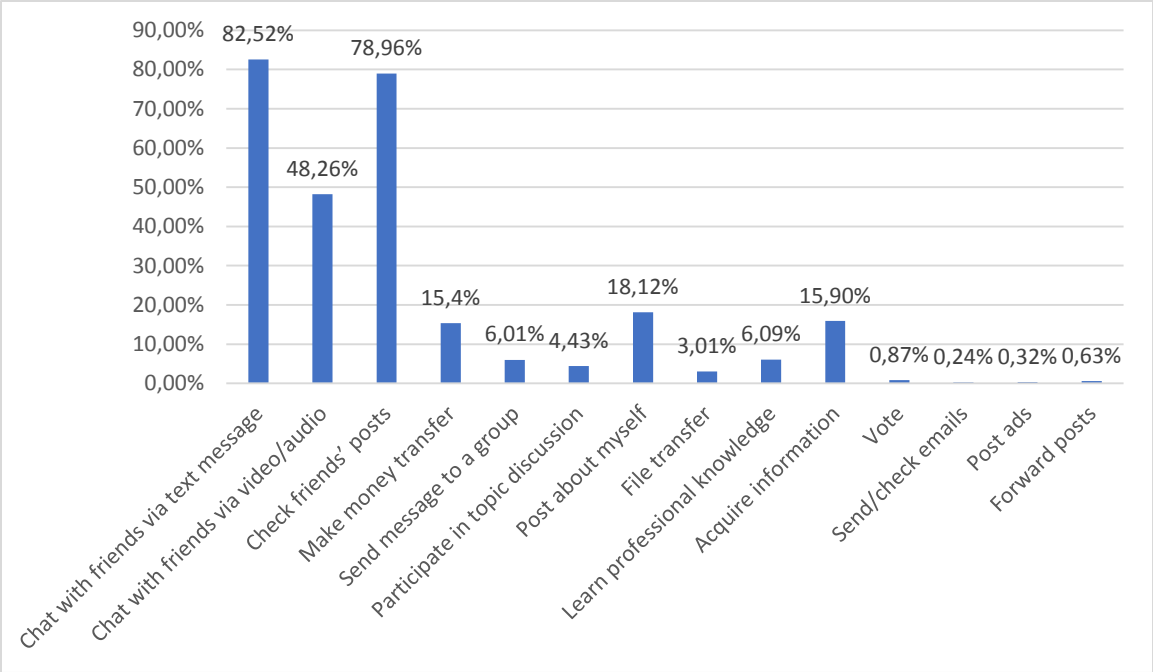

Figure 12: The distribution of WeChat function use

Figure 12 shows that the most used WeChat functions include "chat with friends" (82.52%), "check friends' posts" (78.96%), and "chat with friends via video" (48.26%). Other functions include "post a status" (18.12%), "acquire information" (15.9%), and moneytransfer (15.35%). The results suggest that the transfer function is recognized by users and the financial activities are increasingly active, entailing higher requirements of transaction security for platforms and regulation authorities.

There are many reasons for using Wechat, but it is similar to QQ. Figure 13 shows the cause distribution.

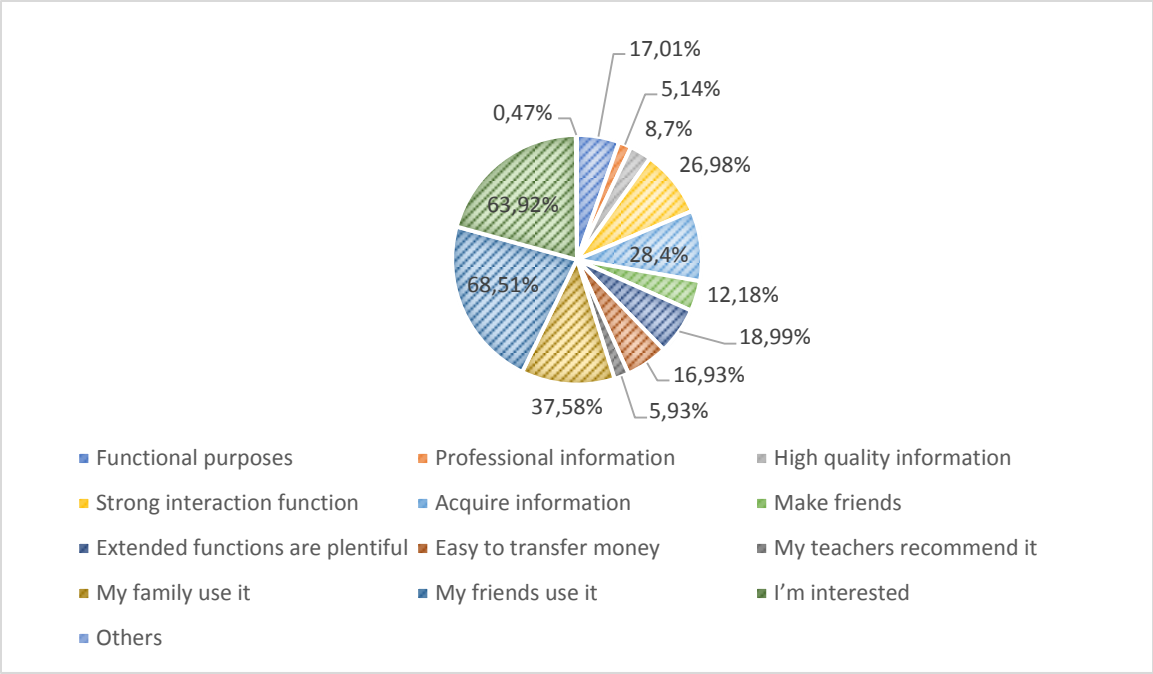

Figure 13: The distribution of the reasons to use WeChat

The reasons to use WeChat are similar to those for QQ and the social networking functions are dominant. Top 3 functions are "my friends use it" (68.51%), "I'm interested" (63.92%), and "my family use it" (37.58%). Users aiming at acquiring information only account for less than 30% (28.45%). However, nearly 30% of the respondents point out that the primary reason for them to use WeChat is its strong interactive function (26.98%).

The most used function of Baidu Tieba is acquiring information (58.59%) and participating in topic discussion (53.66%). Our investigation reveals that over 90% of respondents use Baidu Tiedu anonymously and consider the comments in Tieba emotional. Acquiring information and topic discussion are functions that are more frequently used than other.

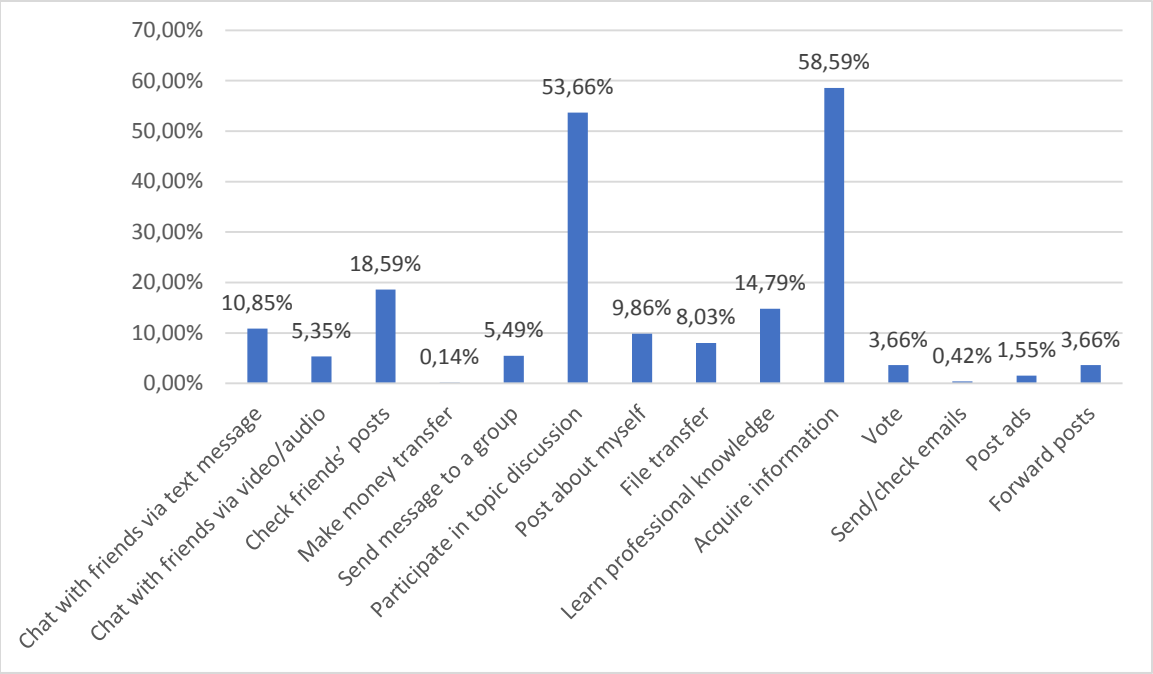

Figure 14: The distribution of WeChat function use

The major reason for college students to use Tieba is information distribution. Among the reasons to use Tieba, personal interests and information acquisition account for 60.7% and 41.69%, respectively. About one quarter of the students explicitly mention that they use Tieba to acquire information.

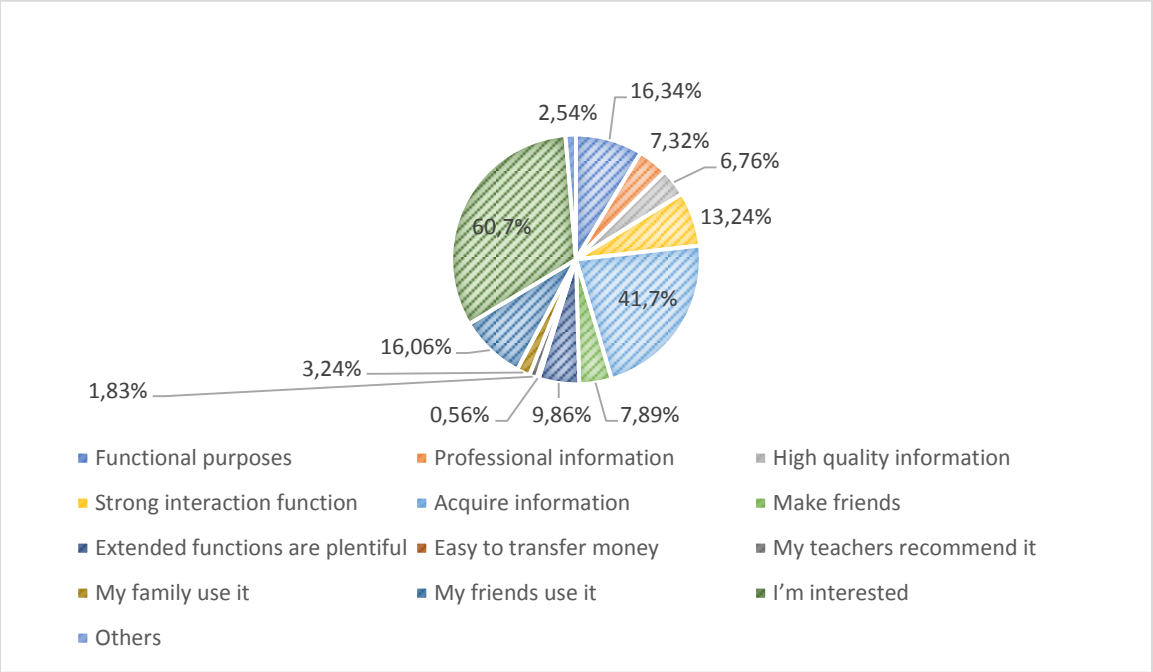

Figure 15: The distribution of the reasons to use BaideTieba

To sum up, due to the different social roles, different "groups" are formed in social media for college students. Different groups are connected with each other, and but are also separated by invisible barriers. The information shared in different groups vary dramatically. Only hot topics can spread through the barriers to other groups[33-35]. "Within-group social interactions" is very popular in social media for college students. The leadership power and influence of these groups are growing. We investigated one Weibo account "PITD Asian PhD Torturing Group" which is established and operated by PhDs from East China Normal University, Durham University, KyungHee University, and University of Science and Technology of China, respectively. As of May 13th, 2018, this account has 130 thousand followers and 5,980 posts. Its followers are mainly Chinese graduate students, post-docs, young faculty, and professors around the world[34-36]. As a self-organization in social media, the PITD Asian PhD Torturing Group established its WeChat account that posts interesting and useful information daily. This group has significant influence among graduate students due to its interesting style and excellent operation. On the contrary, numerous groups serving college students are lack of professional operations. These groups are in the blind spot of regulation of colleges and universities. A large number of negative events such as the spreading of rumors originate from these groups.

Regarding these self-organized groups, schools are expected to guide their students in case of the "group polarization". One solution is to establish online social group at the class level—E-class. E-class is a culture building project for all universities in Shanghai and promoted by the Shanghai Education and Health Party Committee and Shanghai Education Committee with the support of the Center of InternetCulture Development. E-class is virtual community for college students and faculty, and integrates BBS, SNS, blog, microblog, mobile apps, etc. It includes campus apps such as news and address book, and also social apps such as blog, microblog, and forums. College counselors, faculty, and students can communicate online, share resources, and write blog articles. However, the percentage of students who use the app in some schools needs to be improved. Promotion and community maintenance also need further optimization.

The use of human-computer interaction in artificial intelligence technology can help students track "Hashtag" and then discuss and analyze the topic, which is also to enable them to find more similar people with common topics in their social interaction. The related functions of social media are also to realize the association between more users. The social media bias of college students is related to their communication styles. It can be seen that with the deepening of group stratification in social media and the particularity of social media connecting people, groups have become the communication places of rumors and other topics. Therefore, more attention should be paid to the guidance and management of information. Even though the recommendation function is realized by using human-computer interaction technology, the key point of the research is to effectively help students reduce their dependence on social media.

5. Conclusion

In conclusion, the use of hashtag function of college students in social media exhibit the characteristics of both social networking and media. Some social media platforms develop powerful information recommendation function based on their powerful computing capacity. Because the recommended information is generated based on the information viewed in the past, the acquisition of information will exhibit the "information cocoon" phenomenon—only likable but not useful information is recommended. The phenomenon will limit the dissemination of quality news and should cause close attention of all relevant parties.In the research process, the research on different college students is insufficient. In the following research, the social network situation will be studied from college students themselves. In the future research and development, the research of social media and college students' preferences will become an important research direction, and it is of great significance for the study of college students' psychology.

Acknowledgment

The authors express their sincere gratitude to the Shanghai University of Sport and the Shanghai Industry & Commerce Foreign Language College for institutional support. We are especially grateful to the student participants for their valuable contributions to the survey and interaction study.

Conflict of Interest

The authors declare that they have no known financial or personal conflicts of interest that could have influenced the research, authorship, or publication of this article.

Abstract

Environmental literacy has become a widely recognized index for evaluating the effectiveness of environmental education and represents a global consensus on educational values. Understanding the level of environmental literacy and the factors influencing environmental action remain central concerns in environmental education research.

This study examines the environmental literacy of college students in mainland China using an analytical framework composed of three variable groups: environmental knowledge, environmental awareness, and environmental skills. A questionnaire survey was conducted among students in Shanghai Municipality, Anhui Province, and Guangxi Province, covering three academic disciplines across regions with differing levels of economic development. A total of 1,890 valid responses were analyzed.

Descriptive statistical methods and hierarchical regression analysis yielded the following findings:

1. Chinese college students demonstrate relatively low levels of environmental action. They primarily engage in ecologically civilized behavior but show limited participation in civic actions that benefit broader society. Persuasion-induced behavior is present but inconsistent.
2. The overall level of environmental literacy among these students is moderate. Of the three variable groups, awareness is the strongest dimension, while knowledge and skills remain weaker.
3. When applied synchronously, the three environmental literacy variables explain up to 44.8% of variance in environmental action. Among them, environmental desire, behavioral intention, and civic participation skills emerge as the most significant predictors of environmental action.

These findings provide important insights for improving environmental education in Chinese higher education institutions. Recommendations emphasize strengthening civic participation skills and fostering environmental

behavioral intent as essential for enhancing students' overall environmental action.

1. Introduction

Since the 1950s, humankind has caused unprecedented damage to the ecological environment through the combined effects of rapid population growth, technological revolutions, and unsustainable consumption patterns. The resulting environmental pollution and ecological crises have undermined human security and well-being. A deeper understanding of the relationship between human behavior and the underlying mechanisms of environmental problems is therefore essential, and environmental education has emerged as a critical area of global concern.

The concept of **environmental education** was first formally discussed at an international conference hosted by Kiel University, Germany, in 1965. Later, UNESCO and the International Union for Conservation of Nature (IUCN) further developed the concept during a 1970 Nevada, USA, conference. At the 1972 United Nations Conference on the Human Environment in Stockholm, the slogan *"There is only one Earth for humans"* was introduced, and "environmental education" was officially defined. Subsequently, UNESCO and UNEP co-hosted the landmark **Tbilisi Conference on Environmental Education** in 1977, which articulated five key objectives of environmental education: awareness, knowledge, attitudes, skills, and participation (UNESCO, 1978). The vision was that environmentally literate citizens would take individual and collective actions to mitigate environmental challenges.

Environmental action—also referred to as **responsible environmental behavior (REB)**—has long been considered the ultimate goal of environmental education (Hungerford & Volk, 1990; Roth, 1992). Early theories assumed that environmental knowledge would lead to positive attitudes, which in turn would result in pro-environmental behaviors. However, subsequent studies demonstrated that knowledge alone does not reliably predict environmental action (Hungerford & Volk, 1990; Jensen & Schnack, 1997; Pelletier et al., 1998). Consequently, the traditional **knowledge–attitude–behavior model** was gradually replaced with more comprehensive models from the 1980s onward. Among these are the **environmental literacy model** (Hungerford & Tomera, 1985), the **REB model** (Hines et al., 1985), and the **environmental citizenship behavior model** (Hungerford & Volk, 1990).

The cultivation of **environmental literacy** is now widely recognized as the foundation of effective environmental education. Indicators such as integration of science and technology into curricula, sustainable development education, and citizen literacy initiatives have become globally accepted benchmarks for assessing progress in this domain. International studies—ranging from Coyle's (2005) large-scale U.S. survey of adult environmental literacy, to Teksoz et al.'s (2012) examination of Turkish college students, to Shephard et al.'s (2014) research in New Zealand—have collectively highlighted significant gaps in environmental literacy across age groups and national contexts.

In **mainland China**, environmental literacy research began in the 1990s, often linked to broader studies of environmental ethics and awareness. Early surveys (e.g., China National Research Center for Science & Technology, 1994; China Environment News, 1994) found sharp differences between urban and rural populations, and between education levels, in environmental awareness. National studies in 1995 and 1998 confirmed the correlation between education and environmental awareness (China Environmental Protection Foundation & Renmin University; China State Environmental Protection Administration). However, later research (Liu & Lv, 2005) revealed a gap between knowledge/concern and actual participation in environmental initiatives among Chinese college students.

In 2013, the Chinese government formalized this agenda with the release of *Environment and Health Literacy of Chinese Citizens*, which provided key indicators for assessing environmental and health literacy. This policy document underscored the central role of education in achieving ecological modernization. Within this framework, college students are viewed as a **strategic group** whose environmental actions are critical for China's transition toward ecological civilization. Against this background, the present study examines the environmental literacy of Chinese college students and identifies the factors influencing their environmental actions.

2. LITERATURE REVIEW

The concept of **environmental literacy** was first introduced by Charles Roth in 1968, referring to the ability to perceive, understand, and act upon environmental systems in a way that preserves their integrity (Disinger & Roth, 1992). Environmental literacy is generally conceptualized as progressing through four stages: cognition, concern, understanding, and action. Harvey (1977) expanded this framework by distinguishing three levels: environmental knowledge, environmental competence, and environmental concern.

Hungerford and colleagues (1985) refined the construct, emphasizing that truly environmentally literate citizens possess ecological knowledge, sensitivity, values, beliefs, and behavioral strategies that enable them to take effective environmental action. Roth (1992) and Wilke (1995) further argued that cultivating environmental literacy is the cornerstone of environmental education, as it enhances individuals' capacity for environmental participation.

International research has provided comparative insights into environmental literacy. For example, the U.S. **National Environmental Education & Training Foundation (NEETF)** surveyed adults from 1997–2000 and revealed widespread misconceptions, with only 12% demonstrating basic energy knowledge and 10% taking proactive steps to reduce consumption (Coyle, 2005). Similarly, Teksoz et al. (2012) found that Turkish college students' environmental behaviors were influenced by knowledge, attitudes, and responsibility, while Shephard et

al. (2014) reported mixed levels of literacy among New Zealand students. McBeth et al. (2014) advanced the field by designing indices for measuring environmental literacy among U.S. middle-school students, offering a methodological benchmark for subsequent studies.

Within **China**, environmental literacy research has traditionally been embedded in studies of environmental awareness and ethics. Early surveys demonstrated that higher education levels correlate strongly with increased environmental awareness (China Environmental Protection Foundation, 1995). However, studies of Chinese college students indicate that while knowledge and concern are evident, active civic participation remains limited (Liu & Lv, 2005). More recently, national policy documents have framed environmental and health literacy as essential indicators of modernization, emphasizing the role of youth and higher education in achieving sustainability (PRC, 2013).

Taken together, the literature suggests that while environmental literacy is a global priority, its influence on actual **environmental action** remains underexplored, particularly in the Chinese context. This study addresses this gap by investigating the predictive role of knowledge, awareness, and skills in shaping the environmental behavior of Chinese college students.

3. METHODOLOGY (TO CONTINUE ARTICLE)

3.1. Research Design

This study adopts a quantitative survey-based research design to examine the relationship between environmental literacy and environmental action among Chinese college students. The conceptual framework is grounded in three dimensions of environmental literacy—knowledge, awareness, and skills—considered predictors of responsible environmental behavior.

3.2. Sample and Data Collection

A structured questionnaire was administered to college students in three regions of mainland China representing different levels of socioeconomic development: Shanghai Municipality (developed), Anhui Province (developing), and Guangxi Province (less developed). Students were sampled from three academic disciplines (social sciences, natural sciences, and applied sciences). Out of the distributed surveys, **1,890 valid responses** were collected.

3.3. Measurement Instruments

The questionnaire comprised four sections:

1. **Demographic information** (gender, age, major, region).

2. **Environmental knowledge** (10 multiple-choice items assessing familiarity with ecological concepts, policies, and sustainability issues).

3. **Environmental awareness** (12 Likert-scale items measuring concern, values, and attitudes toward environmental issues).

4. **Environmental skills and actions** (15 items assessing civic participation, ecological behaviors, and behavioral intentions).

Reliability and validity of the instrument were confirmed through pilot testing with 120 students prior to the main survey. Cronbach's alpha values exceeded the 0.80 threshold across all subscales, confirming internal consistency.

3.4. Data Analysis

Data were analyzed using **SPSS 26.0**. Descriptive statistics were employed to assess baseline levels of literacy and action. Hierarchical regression analysis was conducted to examine the predictive power of environmental knowledge, awareness, and skills on environmental action.

2.3 International and Domestic Studies on Environmental Literacy

Hodgkinson and Innes (2001) conducted a survey of 399 first-year students across ten academic majors at Murdoch University, Australia. Their findings revealed significant variation in environmental attitudes depending on field of study. Students majoring in environmental studies, biology, and sociology scored highest, followed by those in veterinary science, psychology, and anthropology. By contrast, students of law, business, and computer science demonstrated relatively weak environmental attitudes. Importantly, the study also found that students were reluctant to sacrifice economic benefits for environmental protection, highlighting the influence of economic and political perspectives on environmental attitudes.

Similar investigations were carried out in Turkey in 2006, where Teksoz et al. (2012) examined environmental knowledge, attitude, concern, responsibility, and outdoor activity among 1,345 college students. Their results showed that environmental knowledge was positively correlated with environmental attitudes, concern, and responsibility, but negatively correlated with leisure outdoor activities. Moreover, environmental attitude was found to influence responsibility, while environmental concern was a predictor of both attitude and outdoor leisure activity.

In New Zealand, Shephard et al. (2014) investigated environmental literacy in 2012, focusing on knowledge, affective dimensions, and competence. Their findings suggested no significant gender differences in environmental knowledge and attitudes. However, environmental literacy varied significantly across disciplines, with students in certain fields demonstrating stronger knowledge and practical abilities than others.

Levine and Strube (2012), in the United States, studied the relationships among environmental attitude, knowledge, intention, and behavior. They reported that environmental knowledge and intention were reliable predictors of environmental behavior, while attitude alone was not. Notably, intention served as a mediating variable between attitude and behavior.

In the Chinese context, Marcinkowski and Zhu (2015) developed the Undergraduate Students Environmental Literacy Instrument (USELI) to measure environmental literacy across variables such as awareness, knowledge, and skills, assessing their predictive influence on students' environmental actions.

The earliest targeted research on Chinese college students' environmental literacy can be traced back to the early 2000s. Chen and Lou (2003), at Northeastern University in Shenyang, designed a three-stage, four-layer index system to evaluate environmental literacy. Their survey of literature and science majors revealed that students performed reasonably well overall. Similarly, Zeng (2004) at Nanjing Normal University constructed an environmental literacy evaluation index and surveyed students across 23 specialties in 13 departments, highlighting comparable patterns.

Liu and Lyu (2005) expanded this work by applying quota sampling to survey students from seven Beijing universities, across fields including finance, economics, engineering, medicine, and forestry. While students reported moderate environmental knowledge and awareness of environmental issues, their participation in environmental protection activities remained minimal.

Later studies provided more nuanced insights. Bai (2007) proposed a three-dimensional model comprising knowledge, affect, and behavior. Results indicated that although students paid attention to environmental events and demonstrated a sense of responsibility, their awareness was primarily self-interested rather than grounded in sustainability ethics. Actual participation was limited to basic voluntary activities such as tree planting, waste battery collection, and recycling campaigns.

Collectively, these studies underscore that while Chinese college students possess some level of environmental literacy, active engagement in environmental protection remains insufficient. Furthermore, previous research has often focused on descriptive assessment, rather than systematically analyzing the predictive influence of literacy variables—knowledge, awareness, and skills—on environmental action. The present study addresses this gap.

3. RESEARCH METHODS

3.1. Research Framework and Hypotheses

This study builds upon three widely recognized models: the **Environmental Literacy Model** (Hungerford & Tomera, 1985), the **Responsible Environmental Behavior Model** (Hines et al., 1987), and the **Environmental Citizenship Behavior Model** (Hungerford & Volk, 1990). Based on these frameworks, environmental literacy factors were categorized into three dimensions:

- **Knowledge variables**: ecological and environmental science knowledge.
- **Awareness variables**: environmental sensitivity, sense of responsibility, environmental desire, and behavioral intention.
- **Skill variables**: analytical ability in addressing environmental issues and civic participation skills.

The proposed conceptual framework is illustrated in **Figure 1**. Statistical analyses included Pearson correlation tests, t-tests, and F-tests for relationships among categorical and dependent variables, as well as hierarchical regression to examine predictive validity.

Figure 1. Research framework (conceptual model).

Research Problems

The study addressed the following questions:

1. What is the current level of environmental literacy among college students in mainland China (measured across sensitivity, responsibility, desire, intention, knowledge, skills, and action)?

2. What are the relationships between awareness variables and environmental actions?

3. How do awareness and knowledge variables jointly influence environmental actions?

4. How do awareness, knowledge, and skill variables collectively predict environmental actions?

Research Hypotheses

1. Awareness variables (sensitivity, responsibility, desire, and intention) significantly predict environmental actions.

2. Awareness variables and knowledge variables jointly serve as significant predictors of environmental actions.

3. Awareness, knowledge, and skill variables collectively represent significant predictors of environmental actions.

3.2. Sample and Data Collection

Respondents were selected from universities in Shanghai Municipality (developed region), Anhui Province (moderately developed), and Guangxi Province (less developed). To ensure representativeness, students from three disciplinary clusters were surveyed: humanities and social sciences, business management, and natural/technical sciences.

A total of **2,200 questionnaires** were distributed through faculty coordinators, with **1,952 returned**. To balance class-year representation, stratified random selection was employed, yielding a final valid dataset of **1,890 respondents**. The breakdown included:

- **Gender**: 968 males (51.2%), 922 females (48.8%).

- **Year level**: 478 freshmen (25.3%), 468 sophomores (24.8%), 476 juniors (25.2%), 467 seniors (24.7%).
- **Region**: 616 from Shanghai (32.6%), 663 from Anhui (35.1%), 611 from Guangxi (32.3%).
- **Discipline**: 542 humanities/social sciences (28.7%), 399 business management (21.1%), 949 science/technology (50.2%).
- **Birthplace**: 975 rural (51.6%), 886 urban (46.9%), 29 other (1.5%).

Table 1. Demographic characteristics of respondents.

Variable	Category	n	%
Gender	Male	968	51.2
	Female	922	48.8
Year level	Freshman	478	25.3
	Sophomore	468	24.8
	Junior	476	25.2
	Senior	467	24.7
Region	Shanghai (developed)	616	32.6
	Anhui (moderately developed)	663	35.1
	Guangxi (less developed)	611	32.3
Discipline	Humanities/Social sciences	542	28.7
	Business management	399	21.1
	Science/Technology	949	50.2
Birthplace	Rural	975	51.6
	Urban	886	46.9
	Other	29	1.5

3.3. Research Instruments

To examine environmental literacy and related behaviors of college students in mainland China, a structured questionnaire was designed and implemented. The instrument consisted of five sections:

- **Part 1:** Three items assessing ecological and environmental science knowledge.
- **Part 2:** Four items on environmental sensitivity, four on sense of responsibility, four on environmental desire, and three on behavioral intention.
- **Part 3:** Four items on the ability to analyze environmental issues and four items on civic participation skills.
- **Part 4:** Twelve items addressing environmental actions (ecologically civilized behavior, persuasive actions, and civic actions).
- **Part 5:** Six items capturing demographic and personal background information.

Responses in Parts 1–4 were measured using a five-point Likert scale (1 = none/strong disagreement to 5 = frequent/strong agreement). Items for knowledge and skill were adapted from Zhu (2015), while measures for awareness and actions were primarily based on the **Undergraduate Students Environmental Literacy Instrument (USELI)** (Marcinkowski & Zhu, 2015) and Roth's (1998) environmental literacy scale.

The questionnaire underwent expert validation by six scholars of environmental education in Chinese universities. A pilot study with 216 students led to revisions, after which the finalized instrument was administered. Internal consistency was confirmed: Cronbach's α ranged from 0.81 to 0.91 across subscales, with overall reliability indices exceeding the recommended 0.80 threshold, thus indicating high reliability and validity.

4. RESULTS AND DISCUSSION

4.1. Current Environmental Literacy of College Students

4.1.1. Knowledge Variables

Results indicated a moderate level of ecological science knowledge (M = 3.28, SD = 0.68), with the highest scores reported for ecological systems (M = 3.52) and atmospheric science (M = 3.37). Students demonstrated relatively weaker knowledge regarding demographic change (M = 2.95).

Environmental science knowledge produced a higher overall mean (M = 3.51, SD = 0.65). Notably, knowledge of pollution (M = 3.58) and environment–health relationships (M = 3.79) ranked above knowledge of natural resources (M = 3.17). Together, these results suggest that Chinese college students have greater familiarity with immediate environmental health concerns than with systemic or resource-based ecological issues (Table 2).

4.1.2. Awareness Variables

Environmental awareness variables also yielded moderate results (Table 3). Students expressed strong affective ties to nature (M = 3.89) and high concern about anthropogenic damage to ecosystems (M = 3.65). Sense of responsibility was likewise evident, particularly with regard to adjusting consumption behaviors (M = 3.89) and acknowledging collective responsibility (M = 3.73).

Environmental desire was expressed most strongly in items linked to reactive behavior (M = 3.79), while proactive persistence scored lower (M = 3.35). Behavioral intention produced the strongest mean (M = 3.91), particularly in intentions to adopt low-carbon behaviors in daily life (M = 4.17). Collectively, these findings indicate that awareness levels are encouraging, but proactive civic commitment remains underdeveloped.

4.1.3. Skill Variables

Skills were evaluated through analytic and civic dimensions (Table 4). Students rated themselves moderately capable of collecting information (M = 3.52) and identifying local issues (M = 3.27). However, their civic participation skills were notably weaker, with the lowest mean across all variables (M = 2.85). For example, drafting protection plans (M = 2.84) and mobilizing resources (M = 2.57) were identified as particularly challenging tasks. This disparity suggests that while students possess analytical competence, translating such skills into civic participation remains a significant gap.

4.1.4. Environmental Actions

Environmental actions varied considerably across behavioral categories (Table 5). Ecologically civilized behaviors were most prevalent (M = 4.07), particularly saving resources (M = 4.32) and avoiding harm to wildlife (M = 4.12). Persuasive actions, such as encouraging peers to adopt environmentally friendly behaviors, were less frequent (M = 3.02). Civic actions scored the lowest (M = 1.79), indicating limited engagement with institutions or formal activism.

This gradient suggests that while personal pro-environmental behaviors are relatively common among Chinese students, collective and civic-oriented engagement remains underdeveloped.

4.2. Predictors of Environmental Action

4.2.1. Correlations Among Variables

Correlation analysis demonstrated significant relationships between environmental action and all independent variables ($p < 0.001$). The strongest correlations were observed between environmental action and **environmental desire (r = 0.56)**, **civic participation skills (r = 0.57)**, and **analytical ability (r = 0.53)**. Notably, knowledge variables (ecological science, r = 0.32; environmental science, r = 0.36) were positively correlated with action, but the strength of association was weaker compared to awareness and skills (Table 6).

These findings underscore that while knowledge is an important foundation, affective (awareness) and applied (skills) dimensions are more closely aligned with actual behavior.

4.2.2. Hierarchical Regression Analysis

To further explore predictive power, hierarchical regression models were tested (Table 7).

- **Model 1** included only awareness variables (sensitivity, responsibility, desire, and intention). Results showed that awareness accounted for **38.5% of the variance in environmental actions** ($R^2 = 0.385$, $p < 0.001$). Environmental desire ($\beta = 0.33$, $p < 0.001$) and behavioral intention ($\beta = 0.28$, $p < 0.001$) were the strongest predictors.

- **Model 2** added knowledge variables (ecological and environmental science). The explanatory power increased to **41.7%** ($\Delta R^2 = 0.032$). However, knowledge variables contributed modestly, with environmental science knowledge being marginally significant ($\beta = 0.11$, $p < 0.05$).

- **Model 3** incorporated skill variables (analytical ability and civic participation). The explanatory power increased substantially to **48.6%** ($\Delta R^2 = 0.069$). Among skills, civic participation ($\beta = 0.29$, $p < 0.001$) was the most robust predictor, while analytical ability also showed a significant effect ($\beta = 0.18$, $p < 0.001$).

Summary of Predictors: Across all models, **environmental desire, behavioral intention, and civic participation skills** emerged as the most consistent and significant predictors of environmental action. Knowledge played a secondary but supportive role.

4.3. Discussion

The findings confirm that environmental action among Chinese college students is primarily shaped by **psychological commitment (desire and intention)** and **practical competencies (skills)** rather than by knowledge alone. This aligns with earlier international studies (Levine & Strube, 2012; Teksoz et al., 2012) which also identified behavioral intention as a central mediator between knowledge, attitudes, and action.

The relatively high prevalence of ecologically civilized personal behaviors indicates that students are responsive to direct lifestyle changes requiring minimal institutional engagement. However, the low frequency of civic action highlights persistent barriers to collective environmental participation, such as limited institutional support, lack of training in advocacy, or cultural tendencies toward individual rather than collective activism.

From a policy and pedagogical perspective, these results suggest that higher education in China should move beyond knowledge transmission to emphasize **experiential learning, civic engagement training, and skill development**. For instance, integrating project-based environmental courses, student participation in local governance hearings, and structured partnerships with NGOs could strengthen civic competencies and promote deeper engagement.

4.2.2. Hierarchical Regression Models

In **Model 1**, regression analysis was performed with awareness variables (environmental sensitivity, responsibility, desire, and behavioral intention) as predictors of environmental action. The results (Table 7) indicate that the

model explained **37.2% of the variance** (R^2 = 0.37; Adjusted R^2 = 0.37; F = 110.04, p < 0.001). Among the predictors, **environmental desire (β = 0.28, p < 0.001)** and **behavioral intention (β = 0.22, p < 0.001)** exhibited the strongest effects. Sense of responsibility was not statistically significant. Thus, **Hypothesis 1** was partially supported.

In **Model 2**, knowledge variables (ecological and environmental science knowledge) were added to the awareness predictors. The explanatory power increased only marginally to **38.1%** (R^2 = 0.37; Adjusted R^2 = 0.38; F = 75.98, p < 0.001). Ecological science knowledge was statistically significant (β = 0.10, p < 0.05), while environmental science knowledge was not. The inclusion of knowledge slightly reduced the effects of awareness variables, but environmental desire and behavioral intention remained significant. Hence, **Hypothesis 2** was partly confirmed.

In **Model 3**, skill variables (ability to analyze environmental issues and civic participation skills) were introduced. This final model explained **44.8% of the variance** (R^2 = 0.46; Adjusted R^2 = 0.46; F = 79.15, p < 0.001). Among predictors, **civic participation skill emerged as the strongest factor (β = 0.30, p < 0.001)**, followed by behavioral intention (β = 0.21, p < 0.001) and environmental desire (β = 0.15, p < 0.001). Neither ecological knowledge nor analytical ability retained significance in this full model. Therefore, **Hypothesis 3** was also partially supported.

4.2.3. Discussion

The findings provide important insights into the environmental literacy of Chinese college students.

- **Awareness variables:** Students performed best in behavioral intention, particularly in adopting low-carbon practices and adjusting consumption habits. This reflects a readiness to act at the personal level, but less willingness to engage in broader civic activities.

- **Knowledge variables:** Students reported above-average environmental knowledge, particularly in pollution and health-related topics. However, knowledge contributed only marginally to predicting environmental action, suggesting that factual awareness alone is insufficient to drive behavior.

- **Skill variables:** Students demonstrated moderate ability to analyze issues, but their civic participation skills were underdeveloped. Importantly, when included in regression models, civic participation skill became the strongest predictor of environmental action, highlighting the need to cultivate applied competencies that connect knowledge and awareness to tangible behaviors.

- **Environmental action:** Students most frequently engaged in ecologically civilized behaviors (e.g., saving resources, waste sorting). Persuasive and civic actions were far less common, reflecting a pattern consistent with earlier studies in China and internationally.

These results are consistent with Zhu (2015), who identified behavioral intention and civic participation as key determinants of student action. The present study, however, differs in identifying **ecological knowledge** as a modest but significant predictor in intermediate models, suggesting that disciplinary differences or regional contexts may shape the role of knowledge in China.

5. CONCLUSIONS AND RECOMMENDATIONS

5.1. Conclusions

(1) Environmental action profile:

Chinese college students primarily engage in **individual-level ecological behaviors** such as resource saving and adopting low-carbon lifestyles. Persuasive and civic actions, which require influencing others or engaging with institutions, remain limited.

(2) Environmental literacy level:

Students demonstrated **moderate literacy** across all three dimensions. Knowledge scored 3.40, awareness 3.62, and skills 3.05 on a five-point scale. Although awareness is relatively strong, skills—especially civic participation—are underdeveloped.

(3) Predictors of environmental action:

Hierarchical regression showed that **awareness variables** alone explained 37.2% of environmental action variance, with desire and intention as the strongest predictors. Adding **knowledge** increased explanatory power only slightly (38.1%), while including **skills** raised the explanatory capacity to 44.8%. In the full model, **civic participation skill, behavioral intention, and environmental desire** were the most important predictors.

5.2. Recommendations

(1) Enhance civic participation skills

Universities should prioritize experiential learning opportunities that develop students' ability to design, implement, and evaluate environmental projects. Project-based courses, collaborations with NGOs, and participation in local governance can cultivate civic competencies.

(2) Foster behavioral intention and desire

Curricula should emphasize environmental ethics, responsibility, and value-based learning to strengthen students' internal motivation for action. Field visits to degraded and preserved environments could reinforce concern and desire to act.

(3) Integrate structured environmental education

China currently lacks specialized environmental education courses across most universities. Introducing **mandatory ecological civilization courses** and embedding sustainability themes into existing curricula could help bridge this gap.

(4) Advance environmental education legislation

Unlike many countries with national frameworks, China has yet to legislate environmental education. Enacting supportive policies could institutionalize standards, accelerate progress, and ensure equitable access across regions.

(5) Improve measurement instruments

This study relied partly on self-assessment, which may introduce bias. Future research should develop

standardized, validated instruments that more accurately capture environmental literacy dimensions. Additional variables, such as social context and personal development history, should also be integrated into models to improve explanatory power beyond the current 44.8%.

Acknowledgments

This research was supported by the Ministry of Education in China (Project of Humanities and Social Sciences, Grant No. 15YJC710040) and by the Educational Research Project of Shanghai (Grant No. C18077). The authors also thank the participating universities and students for their cooperation.

Conflict of Interest

The authors declare **no conflict of interest** related to this study. All procedures and analyses were conducted with academic independence and integrity.

Keywords Racial discrimination, hate speech, committee, human rights, equality.

Abstract
Racial discrimination is a blatant violation of human rights in Algeria that must be addressed by all means and adopting internal and international tools to limit it. This can only be achieved by assigning the task to a committee specialized in this matter and by developing a special law to prevent and combat racial discrimination, given that the work is linked to the performance of an international obligation on the one hand and a national duty on the other hand, which achieves internal stability and security, and prevents the unity of the people and the national territory from being exposed to division. The existence of Law No. 05 is not sufficient.-20, which includes the prevention and combating of discrimination and hate speech, but rather requires a mechanism for its implementation similar to what is in effect under international law.

Introduction

The crime of racial discrimination is one of the most significant forms of human rights violations that has long captured humanity's attention in searching for tools and mechanisms to eliminate it, due to its blatant infringement on the natural human rights established by various instruments and declarations concerning human rights, and because it undermines equality, which is the principle and fundamental pillar for safeguarding human rights and dignity.

Therefore, countries have collectively or individually sought to find appropriate solutions that enable them to combat racial discrimination in all its forms, the foremost of which is the culmination of international community efforts in issuing a declaration to combat all forms of racial discrimination, followed by the Convention on the Elimination of All Forms of Racial Discrimination, which clarified the concept of racial discrimination, its causes, and means to curb it. This includes the establishment of a committee entrusted with monitoring and documenting all human rights violations based on racial discrimination in all its forms. The latter defined the composition, tasks, and working procedures of the Convention on the Elimination of All Forms of Racial Discrimination to implement its provisions.

Algeria, like other members of the international community, has been concerned and has rushed to establish the rules and mechanisms necessary to protect individuals' rights from all forms of violations that undermine the principle of equality enshrined in its constitution and laws. This commitment stems from its obligation to implement the content of international agreements it has ratified. Among the forms of human rights violations

that Algeria has sought to combat is racial discrimination, which it has rejected through its constitution and criminalized under the Algerian Penal Code.

Algeria's interest in the crime of racial discrimination increased, especially during the period of widespread popular movement in 2019, which witnessed the emergence of a strange phenomenon in society: speeches of discrimination and the spread of hatred among citizens, threatening the safety and unity of the national territory. This prompted the relevant authorities to think more seriously and deeply about the necessity of swiftly putting an end to this behavior that contradicts the constitution and the laws of the republic and is inconsistent with Algerian norms and beliefs based on unity. The authorities translated this idea by establishing a specific law to combat racial discrimination, referred to as the Law on the Prevention of Discrimination and Hate Speech and its Combat, under number 05-20 in 2020. This law is characterized by a clear definition of the forms of racial discrimination, means of prevention, methods of combating it, and the establishment of a national observatory for the prevention of discrimination and hate speech under the President of the Republic.

The establishment of a national observatory for the prevention of discrimination and hate speech (Jaoui, 2022, pp. 517–518)The President of the Republic has prompted us to question its effectiveness and ability to achieve the provisions of Law 05-20 on the one hand and the objectives of public authority on the other, especially since the law does not specify effective mechanisms for the work of this observatory, but rather merely defines its composition and the powers assigned to it.

This is what led us, through this paper, to propose the idea of establishing a committee to combat racial discrimination by posing the following question: Can the establishment of a national committee to combat racial discrimination be more effective in implementing the content of Law 05-20 on the prevention and combating of discrimination and hate speech?

This is what we will try to clarify through two points:

- International tools to combat racial discrimination
- Submitting a proposal for the formation of the committee and its tasks

1. International Tools to combat racial discrimination

1. 1. Formation and sessions of the committee

The international community has adopted a variety of tools and mechanisms to protect human rights, particularly those related to combating racial discrimination in all its forms. The Committee on the Elimination of Racial Discrimination is one of the most important mechanisms entrusted, under the Convention on the Elimination of All Forms of Racial Discrimination, with the task of monitoring and combating racial discrimination.

Article 8 of the Convention stipulates: "A Committee shall be established to be called the Committee on the Elimination of Racial Discrimination, hereinafter referred to as the Committee."-The Committee works to combat all forms of racial discrimination in accordance with the mechanisms and tools established under the Convention and the internal regulations it has prepared for itself to achieve equality and human dignity in a manner that serves the achievement of international peace and security, which constitute one of the purposes of the United Nations (Dench, 2015, pp. 168–169).

This committee consists of a group of experts with high moral qualities who are chosen by secret ballot for a period of four years, with half being renewed after two years, taking into account fair geographical distribution (Al-Sheikh, 2008, pp. 61–62)The committee's internal regulations have detailed the method of selection. This committee operates under the chairmanship of one of its members and three assistants from among those elected to the committee (United Nations, 1965).

The Committee shall meet in two regular sessions at the Headquarters of the United Nations and may hold extraordinary sessions in accordance with the provisions of Article 3 of its Rules of Procedure. The Secretary-General of the United Nations shall be responsible for all arrangements relating to the holding of the Committee's sessions. Its meetings shall be public unless the Committee decides otherwise in accordance with its statute. Its meetings shall not be valid unless attended by a majority of its members. It shall take its decisions by a

show of hands, approving the proposal in whole or in part only. As for the languages used, they shall depend on what is stated in Article 26 of its Rules of Procedure (Committee on the Elimination of Racial Discrimination [CERD], n.d., Arts. 1 & 12; Dench, 2015, pp. 174–181) .

2. 2. Committee working tools

The committee relies in its work on two mechanisms: the reporting system and the complaints system(Alwan & Al-Musa, 2005, pp. 55–269).

A-Reporting mechanism

The Committee adopts a reporting system to monitor the extent to which States are complying with their obligations to combat racial discrimination. These reports include information on the legislative, judicial and administrative measures taken by States Parties to implement the provisions of the Convention on the Elimination of All Forms of Racial Discrimination in All Areas of Public Life. The Committee is the first human rights body to use the reporting mechanism. The Committee has determined the form and content of the reports to be submitted to it, which must include all the information and a brief description of the policy to eliminate all forms of racial discrimination adopted by the State, in addition to providing legal texts, judicial decisions and relevant regulations that assist the Committee in carrying out its tasks. Submitting reports every two years to the Secretary-General of the United Nations is mandatory for all States(CERD, n.d.-a).

The committee then studies the submitted reports(United Nations, 1965, Art. 9).It is submitted to the States Parties to the Convention, whether discrimination exists or not. It may also request additional information. The reports are studied in a session of which the State is aware, the date, duration and place. The Committee begins studying the reports, taking into account the extent of their conformity with the content of the guiding message that determined the form and content of the report. It then studies the report and submits appropriate proposals and recommendations that are communicated through the Secretary-General of the United Nations to the State concerned (CERD, n.d.-b, Arts. 64, 67, & 68).What distinguishes these proposals and recommendations is that they are merely a form of moral pressure on the state, nothing more, which is what is taken from the committee's work and affects its effectiveness.

B - Complaint mechanism

This mechanism is embodied by giving individuals or states the right to submit a complaint to the committee in the event that a state party to the Convention on the Elimination of All Forms of Racial Discrimination does not comply with its obligations. The committee is considered the first to use this mechanism as a mandatory system.

The Committee examines complaints submitted to it by states and individuals. It examines complaints submitted by states in accordance with the provisions of the first paragraph of Article 11 of the Convention on the Elimination of All Forms of Racial Discrimination by referring the complaint to the state concerned for the purpose of providing sufficient explanations and information to the Committee and referring it to the state that submitted the complaint. If the two states do not reach a solution within a period of six months, the Committee may consider the complaint referred to it to decide on it in accordance with the provisions of its domestic law and the rules of international law.

As for complaints submitted by individuals, the Committee may not receive communications unless at least ten States have deposited a declaration accepting the Committee's jurisdiction to consider complaints from individuals whose rights have been violated for reasons of discrimination. These complaints must include the information specified in Article 84 of the Committee's rules of procedure. The Committee then studies the complaint to ensure that it meets the required conditions, decides on the complaint, submits a report containing its opinion to the Secretary-General of the United Nations, and informs the concerned parties as well. The report submitted by the Committee constitutes an obligation incumbent upon the State, which must implement it based on its commitments under the Convention on the Elimination of All Forms of Racial Discrimination (Dench, 2015, pp. 190–203).

What can be said about the Committee's working mechanism is that, despite its shortcomings, the reports it prepares create obligations for the States Parties to the Convention on the Elimination of All Forms of Racial

Discrimination, which are enforceable in accordance with the rules of international law that oblige States to implement their pledges. This ensures the implementation of the content of the Convention, effectively contributes to the prevention and combating of racial discrimination, and achieves the principle of equality and human dignity.

2. Proposal to form a national committee to combat racial and regional discrimination and hate speech

Given the effectiveness of the work of the Committee on the Elimination of Racial Discrimination, we believe that this can also be applied to the Algerian Law on the Prevention and Combating of Discrimination and Hate Speech, No. 05-20, issued in April 2020, and we present the following proposal:

A chapter in the law is held under the title:

National Committee to Combat Racial Discrimination, Regionalism and Hate Speech

Article 1:

The National Human Rights Council has established a national committee called in the law the "National Committee to Combat Racial Discrimination, Regionalism and Hate Speech."

Article 2:

The committee consists of eleven members.

Article 3:

Committee members shall be chosen from among persons who meet the following conditions:

- The member must hold higher degrees.
- The member must be a researcher, scholar or worker in the field of human rights.
- Enjoy the original Algerian nationality.
- Enjoy civil and political rights.
- Non-partisan or political affiliation.
- Not to hold any ideas based on racial superiority or incitement to it.
- Enjoy good moral behavior.
- Not to have a criminal record.
- Enjoy integrity and neutrality.
- Taking into account the representation of all social and cultural particularities.

Article 4:

Members are chosen by appointment by the President of the Republic and on the proposal of the President of the National Council for Human Rights.

Article 5:

The Committee works to combat all forms of racial discrimination, racism and regionalism, and to reject hatred and intolerance.

It also works:

- The Committee monitors any violation of human rights based on discrimination and differentiation between citizens.
- The Committee shall submit periodic reports determining the human rights situation regarding the issue of discrimination, segregation, and the incitement and cultivation of hatred, and shall submit them to the National Council for Human Rights.

- The Committee shall work to track all forms of racial discrimination, regionalism, and hate speech, and to eliminate them in accordance with the mechanisms specified by this law.
- The Committee is developing a programme of work on how to track cases of racial discrimination and any other form of discrimination, hatred and intolerance.
- The Committee works to combat all forms of discrimination within public and private institutions, educational institutions, and places of worship.
- The Committee shall raise awareness of the seriousness of all forms of racial discrimination, racism, regionalism, and the incitement of hatred. It may also hold training courses and forums and participate in international conferences related to human rights and racial discrimination issues.
- The Committee monitors international developments on human rights issues, particularly those relating to discrimination, racial discrimination, hate speech and violence.

Article 6:

The committee performs its work according to two mechanisms:

- Reporting system
- Individual Complaints System

The Committee's internal regulations determine the forms and procedures by which these two mechanisms are implemented.

Article 7:

Committee sessions

- The National Committee holds two regular sessions a year to study the human rights situation, the extent to which all forms of racism, regionalism and hatred have been eliminated, and the procedures followed to eliminate them.
- The Committee may hold extraordinary sessions whenever necessary, at the request of the President of the National Human Rights Council, its Chairman, or at the request of half of its members.
- Each course lasts for twenty days, and the duration can be extended whenever necessary.
- The committee's decisions are taken by majority vote, and in the event of a tie, the chairman's vote shall prevail.
- Each session culminates in a report submitted to the President of the National Human Rights Council. In its report, the Committee may propose appropriate judicial and administrative follow-up measures and may request an investigation.
- The Committee may, in holding its sessions, call upon experts and specialists in the field of human rights and issues of racial discrimination.
- The Committee's internal regulations determine the form of reports, the method of selecting and participating experts, and the method of submitting a request for investigation.

Article 8:

The National Human Rights Council is responsible for notifying the relevant authorities of any form of racism, regionalism, hatred, or any matter aimed at creating division among citizens that violates the principle of equality, in order to enable them to challenge the reports submitted by the Committee.

The Committee's internal regulations determine the form of the appeal and the method of submitting and examining it.

Article 9:

The National Human Rights Council shall decide on appeals against the Committee's reports within one month, by a decision that is not subject to appeal.

Article 10:

The Committee may submit a proposal to the President of the Human Rights Council to refer cases relating to racial discrimination, racism, regionalism and incitement of hatred to the regionally competent Public Prosecutor.

Article 11:

The Committee may not, under any circumstances, consider complaints and reports submitted to it if they relate to cases that have been decided by a final judicial ruling before the competent regional judicial authorities.

Article 12:

Committee structures:

- The Committee shall consist of a Chairman who shall be elected from among the appointed members.
- The President shall be assisted in his work by a First Vice-President, who shall deputize for him in the event of his absence or the vacancy of the office of President.
- The Committee has branches tasked with monitoring and combating all forms of racial and regional discrimination and hate speech in the country. Each branch is headed by a member of the Committee, appointed by its Chairman after consulting the President of the National Human Rights Council.
- The Commission shall establish offices at the state and municipal levels, and its members shall be appointed by the President of the National Commission to Combat Racial Discrimination, Regionalism and Hate Speech, after consulting the President of the National Council for Human Rights.
- The heads of the provincial offices are selected by the President of the National Commission to Combat Racial Discrimination, Regionalism and Hate Speech.
- The heads of municipal offices are selected by the head of the provincial office after consulting the head of the National Committee to Combat Racial Discrimination, Regionalism and Hate Speech.
- The provincial offices, along with the municipal offices, shall submit monthly reports to the National Commission on all forms of racial discrimination, racial and regional segregation, and hate speech in the province and municipality, and on the extent to which the measures taken by the National Commission or the National Council for Human Rights have been implemented.
- The internal regulations of the Committee determine the membership and functional organization of the offices established by the National Committee to Combat Racial Discrimination, Regionalism and Hate Speech.

Article 13:

- The Committee shall serve for a renewable term of six years.
- Half of the committee members are renewed every three years.
- The Chairman of the Committee shall hold office for a term of six years, renewable only once.
- The appointed members of the National Committee and the heads of its provincial and municipal offices shall be on secondment to their institutions. As for the members chosen from among those who hold liberal professions, their fees shall be determined in accordance with the provisions of the Committee's internal regulations.
- The National Council for Human Rights shall bear all expenses related to the work of the Committee.

Article 14:

The Committee shall establish and regulate its internal regulations.

Conclusion

What can be achieved through this paper is the presentation of some results that we summarize as follows:

- The existence of a law against racial discrimination alone is not sufficient; it requires a body to oversee its implementation.

- The National Observatory for the Fight Against Racial Discrimination in Algeria is not sufficient to eliminate all forms of racial discrimination due to its lack of tools recognized in international law.

- A reporting and complaints mechanism has not been adopted in the work of the National Observatory for the Fight Against Racial Discrimination and its prevention.

- Racial discrimination is a serious crime that cannot be effectively addressed by national tools alone; it requires the use of international tools.

From the above, we can offer the following recommendation:

The Algerian legislator should establish a body similar to that provided for in the Convention on the Elimination of All Forms of Racial Discrimination and adopt the mechanisms it uses to monitor and combat racial discrimination, as this would be more effective in ensuring the implementation of Law No. 05-20 concerning the prevention of discrimination and hate speech and their combat.

Abstract
The international commercial arbitration system is regarded as one of the most significant alternative conflict resolution processes, despite the fact that there are other alternatives to the legal system, including mediation, conciliation, and reconciliation. If classic arbitration is consistently the most popular alternative method for resolving disputes between two or more parties to an international business contract, regarding the judiciary's ability to resolve a particular dispute but when these methods evolved and became electronic, the situation remained unchanged. Contracts for e-commerce are frequently of an international commercial character. The most significant method of settling disagreements resulting from different worldwide business dealings that depend on cutting-edge communications and information technology is electronic arbitration. This happens either before or after the disagreement develops, following an agreement between the two parties to an international business transaction. Along with some restrictions unique to electronic arbitration, the most crucial of which being the means of communication between the disputing parties and the arbitrators, electronic arbitration follows the same procedures as traditional arbitration.

Received: 12.01.2025 | Accepted: 17.04.2025 | Published: 26.08.2025 (available online)

Introduction:

In recent years, the world has witnessed a qualitative shift in changing the methods and means of trade and concluding major deals, which used to require significant effort and money for travel to complete business transactions and sign contracts. The technological revolution in the field of communications and information technology, along with the emergence of what is known as the World Wide Web (the Internet), has transformed the world into a small village, where all commercial and non-commercial transactions can occur easily and conveniently, without the need for travel and waiting. It has also facilitated the resolution of disputes that may arise from the non-fulfillment of some international transactions, without the need for the physical presence of the parties involved in the settlement process at a specific location.

The widespread use of the Internet in the field of legal transactions in general, and in commercial transactions in particular, has led to the emergence of a new type of transaction known as electronic transactions, or what is commonly referred to as e-commerce. The Internet, which is considered a global revolution in our current era, comparable to the previous industrial revolution, is not confined by geographical borders. It has allowed participants to engage in various activities, such as shopping, advertising, and signing different contracts, without the need for travel and physical presence. As a result, the exchange of information and goods, making reservations, and other activities have become extremely easy, requiring minimal effort and time. It is worth noting that the electronic revolution, unlike the first industrial revolution, does not rely on natural resources, except to a small extent, while human resources represent the true capital necessary for this wealth. Human thought and the ability to innovate and develop are at the core of this revolution, while human effort is the means that transforms ideas into innovative, efficient, and profitable achievements.

Due to the increasing use of the Internet in various aspects of life, the number of disputes arising from these uses, especially in e-commerce, is on the rise, particularly with the establishment and registration of company websites, online trading, and the growing number of participants in e-commerce through online contracts, delayed delivery and payment processes, which lead to many disputes that require swift resolution away from regional and local judicial bodies, which have slow and tedious procedures and high costs. The burden of resorting to the judiciary has become significant for contractors in this field, making it no longer an acceptable means of resolving disputes arising from electronic transactions, especially e-commerce disputes that occur between parties of different nationalities and places of residence. Therefore, in light of this inefficiency, parties seek to take faster and more effective steps, agreeing to resort to arbitration to resolve any disputes that have arisen or may arise between them.

Given that ordinary arbitration does not keep pace sufficiently with the speed required for electronic transactions, what is known as electronic arbitration has emerged as a modern method for resolving disputes arising from the use of the Internet in transactions, particularly electronic transactions? Electronic arbitration responds to the characteristics of the e-commerce environment and provides a solution to the numerous obstacles it raises, such as the applicable law and the competent court, among others. Many websites have been created to assist in resolving disputes through electronic arbitration, the most notable of which is the World Intellectual Property Organization (WIPO) center, and e-commerce sites have begun to contract with it to resolve disputes that may arise between them and their clients.

The study of the topic of electronic arbitration in itself brings us face to face with many contentious issues that deserve a dedicated research study on their own. However, we will limit ourselves to pursuing one goal of this research, which is to determine the essence of electronic arbitration as a term and clarify its role in resolving e-commerce disputes, reaching an understanding of the substantive and procedural legal aspects related to it, all of which is considered a means to resolve e-commerce disputes.

The importance of the research stems from the reflection of the tremendous development in the world of communications and information technology on the completion of transactions in record times and resolving any disputes that may arise between parties using modern means that are compatible with the nature of electronic business conducted over the internet, which possesses advantages that are lost in courts and even traditional alternative dispute resolution methods. The significance of researching electronic arbitration lies in the fact that it has become an undeniable reality, especially in the world of cyberspace, regardless of the obstacles it faces, whether legal or technical.

As for the methodology adopted, we relied on the approach required by the subject of the study, which is represented in the descriptive analytical method, as we are in the process of analyzing some texts of international and regional agreements concerned with the subject of the international commercial arbitration system, including electronic arbitration, and the legal rules governing it, distinguishing them from the procedures governing traditional arbitration rules on the other hand.

The study presents the legal systems of the most prominent electronic arbitration centers and the procedures followed until the issuance of the decision, in addition to the position of the most significant related international treaties and some Arab arbitration laws regarding the binding nature of the arbitration decision and methods of proof.

Our research aims to understand the electronic arbitration system as one of the means of resolving disputes arising from international electronic trade contracts, and to understand the legal and procedural relationship between traditional arbitration and electronic arbitration, as well as its advantages and disadvantages, the mechanism by which it operates, and how electronic arbitration awards are enforced.

The issue: This study comes to analyze and answer a fundamental question:

What is the importance of the electronic arbitration system in resolving disputes related to international trade contracts?

This issue branches out into several sub-questions, which are:

- What is the concept of arbitration in international trade contracts?

- How does electronic arbitration differ from traditional arbitration?

- What are the main advantages of the electronic arbitration system?

1. The Concept of Electronic International Trade and Electronic Arbitration

1. 1. The Definition of an electronic international commercial contract

The World Trade Organization defined electronic commerce as: (an integrated set of operations for concluding deals, establishing commercial links, distributing, marketing, and selling products via the Internet), as defined by the Organization for Economic Cooperation and Development. However, the United Nations Commission on International Trade Law (UNCITRAL) approved a model for a unified draft law for electronic commerce, but it did not define the electronic international commercial contract. OECED It is defined as any business transaction based on the electronic exchange of data that occurs between businesses or individuals.).(Saad, 2024, p. 7)

International electronic commerce contracts refer to the integration of communication methods, data management, and security capabilities that facilitate the exchange of information related to the sale of goods and services. It is also defined as the process of selling, buying, or exchanging products, services, and information through a computer network, including the Internet. It is also defined as commerce conducted through an electronic medium, including commerce conducted via television, fax, the Internet, and dedicated communication networks(Shaat, 2018, p. 27)

What is meant by electronic contract? A contract that is subject in its organization to the general rules and provisions that govern the general theory of contract. It is concluded by agreement and consent between its two parties: the obligor and the acceptor. However, it is distinguished by being a contract concluded remotely between absent parties who are not present, using electronic media such as information devices and programs and other modern technical means that operate automatically and automatically once operating orders are issued to them.), and the electronic contract is used

for all actions subject to agreements on the network, mainly downloading programs or files from the network by entering the site's services, specifically those that sometimes require a special subscription or a financial fee. Or for the purpose of obtaining a service such as chat, news groups, advertising, and directories) or for the purpose of registration and contractual commitment to implement the service offered free of charge according to the terms of the site such as free mail services, free hosting, etc., and concluding legal transactions online such as buying, selling, renting, and other commercial transactions.

And Some have defined an e-commerce contract as a contract in which offers of goods and services are accepted by people in the same country or other countries through various electronic media, including the international information network (the Internet), with the aim of concluding the contract.

E-commerce also represents all types of commercial transactions that take place electronically via the international information network (the Internet). These transactions take place either between projects (between companies and suppliers of production inputs, or marketing or distribution facilities), or between companies and their consumer customers, or between establishments and official agencies.

Hence, electronic contracting has become characterized by the following characteristics (Bin Saeed, 2010, p. 37):

1- It is concluded remote, Without the physical presence of its parties.

2- It is concluded using electronic media..

3- It is often characterized by a commercial and consumerist nature..

4- It is often international in nature..

5- Electronic cash payment methods replacing regular cash.

6- It is carried out and implemented online without the need for physical presence .Example: books and the works and recordings.

1. 2. Electronic arbitration To settle international trade disputes

When it comes to settling commercial disputes, arbitration is thought to be an alternative to the legal system. In international contracts, it has become more popular, particularly in the sense that it is rare to find one without an arbitration clause for settling disputes arising from the contract. Arbitration is unquestionably a helpful tool. Its origins in settling disputes between people go back to the dawn of time, and it would be true to say that this is where the judiciary got its start. It got up and put on its beautiful garments, and its back was strengthened by the trust of those who looked to its judiciary (Salama, n.d., p. 5).because it is the closest to achieving justice. When deciding the dispute, Professor John Robert confirmed that: By defining the arbitration system as (achieving private justice, and according to it, disputes are removed from the jurisdiction of the general judiciary, in order for them to be decided by individuals entrusted with this task in the financial incident)(Robert, 1993, p. 6)Arbitration was also defined as (a method for settling disputes arising between countries by neutral official, diplomatic, or judicial figures, or by a mixed committee that investigates rights and justice. International arbitration requires the agreement of the two disputing parties)(Khadrawi, 2014, p. 10). and Optional arbitration It is arbitration In which the parties to a commercial contract agree to settle disputes that will arise or have arisen between them in relation to that contract by resorting to arbitration ,For example, Algerian company (A) buys a commodity from Egyptian company (B).,The contract stipulates that any dispute between the two parties arising from or related to the contract shall be referred to arbitration in accordance with the provisions of Egyptian law, or in accordance with the rules of the International Chamber of Commerce in Cairo, for example. In this example, if a

dispute actually arises between the two parties, it must be referred to arbitration at their discretion. If one of them resorts to the judiciary, the court before which the dispute is filed must refer it to arbitration if the conditions for such referral are met under its national law.

Arbitration in general is an agreement to refer a dispute to a specific person or persons to decide it without the competent court.(Abu Al-Wafa, 2007, p. 15),It is an agreement between two or more parties to refrain from resorting to natural justice and to resort to arbitration. It specifically refers to an agreement between two or more parties to resolve disputes that have arisen or will arise as a result of a contractual or non-contractual legal relationship by arbitration through one or more third parties chosen by them, who shall issue a binding ruling to resolve the dispute according to the applicable law, place, language and time chosen.

The arbitration system differs from the judiciary in several points, including:

- Arbitration requires the consent of the parties, both with regard to resorting to arbitration and choosing the arbitrator, unlike a judge whose jurisdiction is general and the litigants cannot choose the judge of their own free will.
- Arbitration has a specific jurisdiction and specific limits, while the judiciary has a general jurisdiction and a broader scope.
- In arbitration, the parties can remove the arbitrator before the ruling is issued, unlike the judiciary, where the litigants cannot remove or remove the judge, because his removal is within the jurisdiction of the authority appointed to him, and he is bound by the laws of the country in which he assumed the position of judge(Juman, 2008, p. 18).

1. 2. 1 the concept of electronic arbitration

Arbitration is a way to resolve the matter. the topic of contention, and this issue is left to one or more individuals known as the arbiter. Arbitrators or judges must be neutrally qualified, and the two arbitrators will resolve the disagreement in accordance with the agreement reached. They will serve as arbitrators between them and the parties, and their decision will be final and enforceable, (Al-Najjar, 2009, p. 17)It is a system for settling conflicts between natural or legal persons, whereby the parties to the dispute leave the responsibility of resolving it to arbitrators whom they pick of their own free will, instead of going to the judiciary. (Chatillon, 2007, p. 285) The jurist Jena Robert defined electronic arbitration as: "Creating a special space to withdraw disputes from the general judiciary and resolving them by resorting to arbitrators who possess the authority of judges to resolve a specific dispute." However, the Algerian legislator did not provide a legal definition for electronic arbitration and did not explicitly state this alternative system to the judiciary. Nevertheless, we can implicitly derive it by referring to Article 1040 of the Civil and Administrative Procedures Law 08. 09 dated February 25, 2008, amended and supplemented by Law No. 22. 13 dated July 12, 2022, where the legislator expanded the means of concluding an arbitration agreement that allow for written evidence, including various types of modern communication methods, including the internet.(Salawi& Lamia, 2025, p. 1170).

The quick creation and execution of contracts is the foundation of e-commerce, yet this is in contrast to the drawn-out processes of traditional courts. The parties to the dispute do not have to be in person before the arbitrators in electronic arbitration; instead, they can be heard by satellites and other electronic communication tools. Furthermore, the ease of the procedures speeds up the release of verdicts because documents and papers may be sent by email, and experts can be contacted directly or discussed online. As a result, there are many different types of international arbitration bodies, such as committees, chambers, organizations, or arbitration centers. The majority of nations have complied with the norms and principles set by the United Nations, including the UNCITRAL Model Law on International Commercial Arbitration and the UNCITRAL norms of 1976, as well as a number of arbitration agreements.

An electronic arbitration agreement means that the parties to the arbitration agree on an arbitration clause via modern means of communication (Suleiman, 2011, p. 112). Electronic arbitration can be defined as arbitration whose procedures are conducted over the Internet. It gains its electronic nature from the method in which it is carried out, as it

is done in an audio-visual manner through an open international network for remote communication, without the need for the parties in dispute and the arbitrators to meet in a specific location..

1. 2. 2 the Scope of application of electronic arbitration

Despite the legal issues that parties to these disputes may face when resorting to electronic international arbitration, particularly in the enforcement of foreign judgments under the New York Convention on the Recognition and Enforcement of Foreign Arbitral Awards of 1957, the situation becomes more complicated when the consumer enters the contractual relationship, making it not purely commercial, but of a mixed nature dominated by the aspect of adhesion, especially with the legislations' emphasis on issuing specific laws to protect consumers from abusive terms.

- Resorting to the electronic arbitration system can be done in two ways:
- - The arbitration institution has a pre-prepared model for this request available on its website, where the parties fill out this form and then click the submit button to send it directly to the arbitration institution via its website.
- - Writing the requests in the form of an electronic data message on a computer connected to the internet, using one of the electronic writing programs such as DOC, PDF, or RTF. Once the concerned party finishes writing the electronic arbitration request in this manner, they submit it.(Zaazoua&Zaazoua, 2022, p. 144).

1. 3. the Dimensions and advantages of electronic arbitration

Disputing parties resort to choosing the electronic arbitration system as an alternative system for settling disputes that arise between them regarding the implementation of international trade contracts, for the purposes or advantages they see in arbitration, compared to other means of resolving commercial disputes and disagreements.

1. 3. 1 Dimensions of electronic arbitration

Electronic arbitration aims to purify and secure the electronic work environment and related matters by settling or resolving existing electronic disputes, and providing advisory services that can prevent disputes from occurring, in order to create a healthy digital community, through the following:

- Providing arbitration services through external arbitrators via electronic communication channels to settle or resolve disputes arising from a legal relationship of an economic nature, whether contractual or non-contractual, whether in the public or private sector, or between them.

- Providing advisory expertise in electronic transactions, such as responding to requests from entities to complete a specific contract that has some deficiencies, or reviewing the provisions of a specific contract under certain circumstances that have arisen after its conclusion..

1. 3. the Advantages of Electronic Arbitration

The arbitration system holds significant importance in resolving disputes related to international trade contracts, due to the simplicity of procedures and the speed in resolving disputes, unlike the judiciary, which is characterized by complicated procedures and prolonged dispute resolution times. The international commercial arbitration tribunal includes specialized arbitrators in the technical aspects of the arbitration subject, facilitating a quicker resolution

compared to regular courts. Furthermore, the arbitration system is primarily based on the will and agreement of the disputing parties, who choose to resort to arbitration instead of litigation and select the type of arbitration (ad hoc or institutional), either in the form of a clause or an arbitration agreement, before or immediately after the dispute arises. After reaching a friendly resolution to the dispute through arbitration, the parties maintain their amicable relationship and their reputation in the field of commercial transactions, in addition to the freedom of the parties to choose the applicable law for resolving the international commercial dispute.

Traditional international commercial arbitration is characterized by numerous advantages, most notably that the diversity of international commercial transactions and their relation to contracts that sometimes involve complex conditions and technical details make the expert arbitrator more capable of understanding them than a legal practitioner. Additionally, the arbitration tribunal enjoys broader freedom regarding litigation procedures, such as managing and organizing sessions, notifications, and presenting data, which leads to the parties' confidence in the decision that the arbitrator or arbitration tribunal will issue to resolve the dispute(Bariri, 2004, p. 10).

1- There are other benefits to using electronic arbitration rather than traditional commercial arbitration or even national courts in e-commerce and e-contract issues. Among these benefits are:
2- 1. Using electronic arbitration, or online arbitration, eliminates the need for the disputing parties, witnesses, and experts to travel to the arbitration site, which may be distant from their homes or places of business.Because the disputants may be heard through online talks, this saves time and money on travel(Al-Rumi, n.d., p. 93).
3- This prevents the parties to the contract from being subject to legal and judicial oversight of electronic contracts. This avoids the legal non-recognition of these contracts or the difficulty of determining the applicable law and the competent court. This is not an easy matter under ordinary courts when a dispute is referred to them.
4- Speed of resolution in disputes: This feature greatly surpasses the slow pace and backlog of cases that typically occur in the corridors of national courts, especially with the increase in e-commerce contracts. This arbitration significantly outpaces the speed of resolving disputes presented to it compared to resorting to regular commercial arbitration, which requires a much longer duration than this arbitration. The reason for this is the physical presence of the parties and the arbitration panel, as well as the exchange of pleadings and documents between the parties to the case.(Mansour, 2009, p. 482).
5- Desire to present the dispute to experienced people: A private and trusted company that cares about and keeps pace with the development of e-commerce, especially in the technical and legal fields of this trade.
6- Confidentiality: This is an advantage of arbitration in terms of its existence and results at all stages, which prevents any damage to the reputation of the parties to the arbitration.
7- Ease of obtaining a ruling: Because documents can be submitted by email or through a unique interface created by the arbitrator or the electronic arbitration center, it is simple to submit data and receive arbitrators-signed awards.
8- The existence of a global pact pertaining to the acceptance and implementation of arbitral rulings It is depicted in: Convention of 1948-1958 AD in New York on the Recognition and Enforcement of Arbitral Awards This contrasts with court decisions because, while regional and bilateral agreements exist to implement it, there is currently no agreement governing international recognition and implementation, such as the New York Convention.(Mansour, p. 482).
9- Speed of issuing the arbitration award: This is achieved due to the ease of electronic arbitration procedures, which are completed by submitting documents via email. It is also possible to directly contact and dialogue with experts and technicians via the Internet.
10- Reducing the costs of electronic arbitration:Due to the fact that neither the parties, witnesses, nor arbitrators must travel across national borders, electronic arbitration is distinguished by its low costs. In line with the size of e-commerce contracts, this eliminates the need for hotel stays, airfare, and court and expert fees. (Bilal Abdul Muttalib, 2006, p. 95).

From the foregoing, it is evident that the electronic arbitration system in international business transactions offers numerous benefits that benefit the two parties to the contract, or parties to it, in the event that a disagreement emerges between them. The most notable of these benefits are the ease of the arbitration process, the speed at which the dispute

is settled, the speed at which the arbitration award is issued, and the lower costs of electronic arbitration, all of which contribute to the maintenance of cordial relations and the continuation of business dealings between them.

2. Electronic Arbitration Award

The electronic arbitration award is considered one of the most prominent issues that establishes the legitimacy of electronic arbitration, as it represents the fruit of the agreement and the procedures of the arbitration process as a whole for the parties involved in arbitration on one hand, and a part of the state's authorities and sovereignty represented in the judiciary on the other hand.

The electronic arbitration award raises numerous questions not only regarding its form but also concerning its implementation. Should we consider the arbitration award valid if it is issued in electronic form? Consequently, is this award enforceable by the national courts in the state where enforcement is sought? In light of the fact that most Arab arbitration laws do not regulate electronic arbitration awards, and to answer these questions and others, as well as to understand the nature of the arbitration award, how it is issued, and how to challenge it, we will divide this section into two demands: the first will address the nature of the arbitration award, and the second will discuss the effects of the arbitration award.

2. 1. What is the electronic arbitration ruling?

The definition of an electronic arbitration award is no different from the definition of an arbitration award in general, as the electronic arbitration award is made over the Internet, a medium limited by international agreements and protocols for the exchange of documents and information. Therefore, an arbitration award refers to all decisions issued by the arbitral tribunal over communications networks, whether final, interim, or partial, without the need for the physical presence of the arbitral tribunal members in one location..

2. 1. 1 Issuance of the arbitration award

An electronic arbitration award means: (all decisions issued by the arbitration panel via communication networks such as the Internet, whether final, interim, preliminary or partial decisions, without the need for the physical presence of the arbitration panel members in one place). The electronic arbitration award represents the fruit of the arbitration process from beginning to end, and it is what determines the extent of the legitimacy of the arbitration. Issuing the award is the most important stage of the arbitration process, and a question arises as to whether the electronic arbitration award has a special form that differs from issuing a traditional arbitration award(Salawi& Lamia, 2025, p. 1180).However, Most texts that require writing do not stipulate a specific form for their formulation or method of recording. They may be handwritten or electronically. Therefore, issuing a ruling in electronic writing fulfills the form requirement required by national legislation and international agreements. The electronic arbitration award data is distinguished by the fact that it is written electronically and signed electronically, which is what the nature of this type of arbitration allows, as it was permitted by the Model Law on Electronic Signatures of 2001(United Nations, 2001, Art. 6(1)).As well as the United Nations Convention on the Use of Electronic Communications in International Contracts of 2005 (United Nations, 2005, Art. 9),However, the electronic arbitration award and all paper documents must be extractable on paper so that they can be submitted to the courts for confirmation and enforcement of the electronic award, making it binding.

With regard to signing the award, Article 30 of the Model Law on International Commercial Arbitration stipulates that the arbitration award must be issued in writing. Article (31) of the same law stipulates that the arbitrator and arbitrators, if there are multiple arbitrators, must sign the arbitration award. This is the practice in ordinary arbitration, where the arbitrators sign the award by hand, but handwriting is not available in electronic arbitration. Therefore, some have suggested - to address the problem of the absence of handwritten signatures by the arbitrators - sending a printed copy of the award to the members of the arbitration committee for signature.

2. 1. 2Completion of electronic arbitration procedures

Following an email interaction between arbitrators (if there are numerous arbitrators) and deliberations, which are frequently performed via videoconference, the electronic arbitration award is issued. However, does the arbitrator's or the arbitration panel's function cease after the arbitration award is issued? Before rendering a final decision regarding the dispute, is there anything the arbitration panel can do to prepare? It is undeniable that the arbitration panel's responsibilities continue after the arbitration award is issued. Instead, in cases when the award is unclear, lacking, or may need explanation—discussed in turn—the panel maintains part of its authority in the dispute.. (Bin Saeed, 2010, p. 234)Laws vary in their requirement for the reasons for an arbitration award, but most stipulate that "the arbitral tribunal must provide reasons for its decision unless the parties agree not to provide reasons."

We can infer from this requirement that the arbitration decision is issued after the trial is resolved and the procedures are completed unless exceptional circumstances arise that prevent this, with clarification to the individuals if any, and it is required that the decision be issued in writing, and a majority is sufficient for its issuance with the signature of the president and members with mention of the opinion of the dissenting member if the ruling is not unanimous, and a summary of the statements of thetoruleTheir documents, the reasons for the ruling, its operative part, the place where it was issued, and the date of its issuance..

2. 2. Effects of electronic arbitration

The issuance of an electronic arbitration award entails some effects, the most important of which is the enforceability of that award immediately upon its issuance, and at the same time the ability to be preserved in confirmation of the principle of confidentiality - which is considered the basis for resorting to electronic arbitration - therefore it is necessary to address the validity of the electronic arbitration award and the extent of its ability to be appealed in the first paragraph, and its implementation..

2. 2. 1. The validity of electronic arbitration and its appeal

Most legislations recognize the res judicata effect of arbitration awards. Regarding electronic arbitration, the situation is not much different, as paragraph 25 of the Space Court Regulations states that arbitration is considered final and cannot be appealed. Paragraph 6 of the aforementioned article stipulates that the parties' agreement to submit the dispute to arbitration in accordance with the Space Court Regulations constitutes a waiver of their right to appeal the award by any means. This ruling is consistent with the system of the virtual judge, unlike the system of the Space Arbitration Court, which allows for the appeal of its rulings before the competent court for appeals against judgments issued by first-instance courts. Therefore, the parties cannot request the enforcement of the award until it becomes final, either by the expiration of the appeal deadlines or by the rejection of the appeal.

Some scholars argue that the arbitration award takes effect from the date specified for issuing the arbitration decision. In contrast, others believe that the res judicata effect of the award is not absolute, although the arbitration award enjoys this effect, indicating that the scope of this effect is determined by the scope of the arbitration agreement. Thus, the award has res judicata effect only within the limits of the issues addressed in the arbitration agreement.

As for the legislative aspect, many legislations have recognized the authority of the res judicata of arbitration awards. Article 55 of the Egyptian Arbitration Law No. 27 of 1994 states that "the awards of arbitrators issued in accordance with this law shall have the authority of res judicata and shall be enforceable in accordance with the provisions set forth in this law." Similarly, the Jordanian Arbitration Law No. 31 of 2001 stipulates in Article 52 that "the awards of arbitrators issued in accordance with this law shall have the authority of res judicata and shall be enforceable in accordance with the provisions set forth therein." Thus, the Jordanian legislator has followed the Egyptian legislator regarding the authority of res judicata for electronic arbitration awards. In Algerian legislation, electronic arbitration awards also have the same legal authority as traditional arbitration, provided that they meet the legal requirements. One of the most important effects of an arbitration award is that it acquires the authority of res judicata, as the arbitration award, once issued, immediately possesses this authority in the dispute that has been definitively resolved, even though it is subject to appeal

by one of the means such as a review. The authority means that the ruling does not become final; it is a temporary authority that ceases if the ruling is annulled and is confirmed if it becomes final (Terki, 1999, p. 125)

2. 2. 2Enforcement and preservation of electronic arbitration awards

Firstly. Enforcement of electronic arbitration award:(New York Convention, 1985)

International enforcement of arbitration awards is based on international agreements, such as the New York Convention of 1958, the European Convention on International Commercial Arbitration of 1961, the Washington Convention of 1965, and the Model Law on International Commercial Arbitration of 1985.

secondly. Procedures for implementing the judgment:(Geneva Agreement, 1961)

1. Filing the arbitration award with the court clerk of the competent court.

2. Expiration of the period for filing a nullity action against the arbitration award.

3. Obtaining an order to enforce the arbitration award.

4. Submitting a petition to the competent judge to issue the enforcement order.

5. Attaching the necessary documents for the enforcement process (original award, a copy of the arbitration agreement, a copy of the documents indicating the filing of the arbitration award with the court clerk).

6. Providing evidence of the accuracy of the information contained in the (award and agreement) if they are electronically signed.

In conclusion, we would like to point out that electronic arbitration, which has recently emerged and is still in the process of legal and technical updating and regulation, still requires intervention from international organizations and countries to establish a comprehensive framework that ensures the recognition and regulation of this new type of arbitration.

Conclusion:

Based on the above, we can say that the resort of contractors to electronic arbitration, as an unusual alternative means of resolving e-commerce disputes, is aimed at settling the disagreements that arise between them regarding the implementation of international electronic trade contracts. We presented the nature of e-commerce, its characteristics, the concept of electronic arbitration, its emergence, and scope of application, as well as how to resort to electronic arbitration and its selection by the disputing parties as an alternative to international courts, due to its ease, low cost, and other advantages. We reviewed how to complete the electronic arbitration agreement, its forms, electronic arbitration procedures, and how the arbitration process proceeds, leading to the goal of resorting to arbitration and choosing an arbitration center or body, which is to reach and obtain the issuance of the electronic arbitration award, its enforceability, and ways to appeal it before executing this award issued by the civil arbitrator or the arbitration court, without delay or procrastination. However, the losing party may be acting in bad faith and refuse to implement the award, which forces the benefiting party to resort to the national judiciary of the state with jurisdiction over enforcement, to request the execution of this award. Since the issued award may not be satisfactory to one of the parties, what is the solution in the face of its obstinacy or non-compliance with the arbitration decision, especially since the electronic arbitration award may not be binding? Given that electronic arbitration is a hybrid system that cannot be divorced from its traditional origin; the principle is that the electronic award should be executed by the same mechanism used for executing traditional arbitration awards, if possible. Due to various considerations that make it difficult to follow the same previous mechanism, it may be implemented in ways that align with the peculiarities of the virtual world without the need to

follow the procedures for enforcing foreign arbitration awards, provided that the arbitration award is deposited with the court clerk of the court where the competent judge for its enforcement is located in order to obtain the judgment in the form of an enforcement order. In the case of determining the place of arbitration, the electronic judgment has its own nationality, similar to regular arbitration awards. We can categorize arbitration awards in terms of enforcement into two types: enforcement in the country of issuance of the arbitration award, which is subject to the procedures for enforcing regular judgments and is considered like any local arbitrator, and enforcement and recognition in foreign countries, which is subject to the 1958 New York Convention, the provisions of which also apply to electronic arbitration awards.

In conclusion, we can say that electronic arbitration is still in the process of modernization and legal regulation, and it still requires intervention from countries and international organizations to establish a comprehensive framework that ensures the universality of recognition and regulation of this new type of arbitration, which is an effective system that provides many advantages not offered by traditional arbitration. The only barriers to its development and effectiveness are the lack of a specific international legal framework for it, in addition to the approval of national legislations regarding electronic transactions, especially concerning the specifics of electronic arbitration.

Results:

1. Electronic arbitration is a means of resolving disputes that arise in an electronic environment, and the intention to resort to it, raise the dispute, and conduct the proceedings until the issuance of the ruling and its notification is all done electronically.

2. Electronic arbitration is conducted using electronic means at all stages of resolving international commercial contract disputes from the beginning until the issuance of the arbitration ruling.

3. The electronic arbitration agreement does not differ much from the traditional arbitration agreement regarding substantive conditions, as much as it differs in the fulfillment of formal conditions, which are represented in that writing and signature are done electronically.

4. Electronic arbitration is the best means for resolving many disputes, including those related to intellectual property and disputes arising from electronic actions in general and e-commerce in particular.

5. The inability of arbitration laws, especially the Arab ones, to keep pace with the advancements brought about by the communications revolution and its implications on the nature of contracting and the non-material contexts used in it.

6. A reconsideration of some national legislations and an attempt to amend them to align with international agreements concerning electronic international trade contracts and electronic arbitration.

Suggestions:

1. A reconsideration of some national legislations and an attempt to amend them to align with international agreements concerning electronic international trade contracts and electronic arbitration.

2. The necessity of holding seminars and legal sessions to raise awareness of the role and importance of electronic arbitration across all academic and governmental axes.

3. Conducting training courses for specialized human resources "arbitrators" in the electronic arbitration system.

4. The necessity for national laws to recognize the validity of electronic arbitration sessions and to accept the evidence presented therein and the defenses raised.

5. The necessity of reaching a mechanism that provides legal security for transactions conducted via the internet.

6. Finding a legal legislative solution that permits resorting to electronic arbitration if this solution is more suitable for the consumer.

7. Engaging in global and regional agreements for international commercial arbitration.

Issue web link https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html

Keywords Compliance obligation, administrative oversight, consumer protection, domestic products, imported products.

Abstract
The issue of administrative oversight of product compliance constitutes one of the principal mechanisms adopted by the Algerian legislature to ensure consumer protection. To elucidate this oversight, this paper first examines the administrative supervision of domestic products within the market through a review of inspection procedures, such as document examination, hearing from stakeholders, entry into commercial premises, direct inspection and sampling, which culminates in the drafting of violation reports. It also addresses the administrative authority's powers to implement appropriate precautionary measures, including storage, seizure, temporary or permanent withdrawal, destruction, and temporary suspension of activity. The second part of the study focuses on the administrative oversight of imported products at border points, highlighting the role of specialised regulatory bodies and the procedures followed, as well as the precautionary measures applicable, such as conditional authorisation of entry or outright refusal of entry in cases of noncompliance with legal and regulatory standards.

Introduction:

Administrative oversight of product compliance has been accorded particular importance under the provisions of Law No. 09--03 on consumer protection and fraud prevention (as amended and supplemented). This is due to the pivotal role that product compliance plays as a mechanism for consumer protection, especially as the concept of compliance has expanded to encompass a product's conformity with technical regulations and requirements related to health, safety, security, and the environment.[1]

This is evident from the provisions of Law No. 09--03 on Consumer Protection and Fraud Prevention (as amended and supplemented), which dedicates Chapter II of Title III to procedures for monitoring product compliance. Under Article 29 of this law, these monitoring procedures are entrusted to the officers referred to in Article 25 of the same statute.

[1] Ayad, Mohamed Imad Eddine, "The Consumer Contract in Algerian Legislation" (unpublished PhD thesis, Faculty of Law and Political Science, University of Blida 2, 2016), 397.

Notably, the officers referred to in Article 25, who are authorised to exercise administrative oversight in this context, are of three categories: judicial police officers,[2] officers authorised pursuant to specific statutory provisions,[3] and fraud prevention officers[4] attached to the ministry responsible for consumer protection.

Moreover, the legislature did not limit itself to merely authorising these officers to perform monitoring duties; instead, it granted them powers to facilitate the exercise of such oversight. Article 29 of Law No. 09-03 demonstrates that the legislature has vested these officers with extensive powers, granting them discretion regarding the means employed and the timing of measures taken at all stages of the process of offering products for consumption to ensure effective monitoring of product compliance.

On this basis, the central question arises: How can administrative oversight of product compliance, as a mechanism for enforcing the obligation of compliance, ensure the effective implementation of this obligation in a manner that guarantees consumer protection?

To address this question, the study has been structured according to a bipartite plan as follows:

- **First section:** Administrative oversight of domestic product compliance at the market level.
- **Second section:** Administrative oversight of imported product compliance at border points.

Section One: Administrative Oversight of Domestic Product Compliance at the Market Level

In the context of exercising administrative control to ensure the enforcement of the obligation of product compliance, regulatory officers, each according to their area of expertise, carry out procedures to identify products available on the market. These procedures enable officers to take measures that fall within the scope of administrative powers in supervisory operations.

This necessitates an examination of two key issues. The first concerns the need to understand the procedures employed in the administrative oversight of product compliance at the market level (First), whereas the second relates to understanding the administrative authority's powers in adopting precautionary measures concerning domestic products (Second).

First: Administrative Oversight Procedures Related to Product Compliance at the Market Level

An analysis of the provisions of Law No. 09--03 on Consumer Protection and Fraud Prevention reveals that the Algerian legislature has granted the authority to exercise administrative oversight of domestic product compliance at the market level to specific bodies, namely, fraud prevention officers. These officers are vested with powers to carry out direct supervisory duties at the market level. Such oversight is conducted through a series of procedures about product compliance at the market level, which will be outlined in detail in the following sections.

1. Examination of Documents and Hearings of Relevant Stakeholders

[2] See Article 15, which defines who holds the status of judicial police officer, in Ordinance No. 66-155 of 8 June 1966, Code of Criminal Procedure, as amended and supplemented by Ordinance No. 21-11 of 25 August 2021, Official Gazette No. 65 of 26 August 2021.

[3] These include customs officers and veterinary officers. See Zahia Houria Si Youssef, *Study of Law No. 09-03 of 25 February 2009 on Algerian Consumer Protection* (Algiers: Houma Printing, Publishing, and Distribution, 2017), 73.

[4] The Fraud Prevention Division includes the following ranks: Fraud Prevention Controllers (to be phased out), Fraud Prevention Investigators, and Fraud Prevention Inspectors. See Article 4 of Executive Decree No. 09-415 of 16 December 2009 Establishing the Special Statute Governing Employees in the Special Ranks of the Administration in Charge of Commerce, Official Gazette No. 75 of 20 December 2009.

Oversight of product compliance with specific distinguishing requirements is carried out through the examination of documents or by hearing relevant stakeholders.[5] The officers perform this procedure referred to in Article 25 of Law No. 09--03 on Consumer Protection and Fraud Prevention (as amended and supplemented), regardless of their designation, whether they are judicial police officers, officers authorised under special statutory provisions, or fraud prevention officers under the ministry responsible for consumer protection. In the course of their supervisory duties, and without the restriction of professional secrecy being invoked against them, these officers are empowered to view and examine all papers or technical, administrative, commercial, financial, or accounting documents, as well as all magnetic or digital media. In addition, they may request access to any of the aforementioned documents, regardless of whose possession they are in, and may proceed to seize them.[6]

Notably, the procurement of such documents and records by the aforementioned officers may also take place even in the absence of relevant stakeholders or their legal representatives. In such cases, access may be obtained through any employee who holds these documents by virtue of their position, and neither the absence of the stakeholder nor their legal representative may be invoked to prevent the officers from reviewing the documents.[7]

For hearing the relevant stakeholders and their employees, this procedure serves to obtain all the information that facilitates the proper execution of the supervisory task, particularly in cases where documents are refused, unavailable on the premises, or withheld under the pretext of the absence of the shop owner or the company's manager.[8]

Entry into Commercial Premises

In addition to the aforementioned procedure, the legislature authorised the officers referred to above, within the framework of exercising oversight of product compliance, to enter commercial establishments, offices, annexes, and loading and storage facilities, with the freedom to do so either by day or by night. Such access may generally be exercised in any location.

However, this broad authorisation does not extend to premises used for residential purposes, which may only be entered in accordance with the provisions of the Code of Criminal Procedure.[9] Article 29 of Law No. 09-03 grants supervisory officers extensive and unrestricted powers with respect to product monitoring regarding the means employed (by any means), the timing (at any time), and the scope (at all stages of the process of offering products for consumption). Conversely, Article 34 places limits on the authority of supervisory officers when it concerns premises used for residential purposes, stipulating that entry shall be carried out in accordance with the Code of Criminal Procedure.[10] The latter provides that the inspection or search of dwellings may not commence before five:00 in the morning or after eight:00 in the evening, except in specific circumstances or under legally defined exceptional conditions.[11]

The legislature has exempted premises of a residential nature from unrestricted access, adhering to the provisions of the Code of Criminal Procedure. However, it has not required supervisory officers to obtain and present a written

[5] See Articles 29 and 30 of Law No. 09-03 of 25 February 2009 on Consumer Protection and Fraud Prevention, *Official Gazette* No. 15 (8 March 2009), as amended and supplemented by Law No. 18-09 of 10 June 2018, *Official Gazette* No. 35 (13 June 2018).
[6] See Articles 33 and 30 of Law No. 09-03.

[11] See Article 47 of Ordinance No. 66-155, Code of Criminal Procedure, as amended and supplemented.

authorisation.[12] Issued by a specific authority prior to entering and commencing their oversight activities. The rationale behind this, from our perspective, lies in recognising the unique nature of the duties performed by supervisory officers and in facilitating their work procedures. For this reason, the legislature did not require written authorisation so as not to hinder their performance of duties and to ensure that their work is carried out with ease.

3. Direct On-Site Inspections by Visual Observation or Measuring Instruments

In addition to the preceding measures, the legislature has authorised the aforementioned officers to conduct direct inspections, either through visual observation or with the aid of measuring instruments. Direct inspections refer to procedures aimed at detecting violations that can be established through visual examination of products or observation of services offered for consumption or by using simple measuring devices or instruments, which allow for the immediate detection of infringements without the need for in-depth analysis.[13]

However, in their efforts to carry out direct inspections through visual observation, the officers referred to in Article 25 of Law No. 09--03 aim to uncover violations that may take multiple forms. Examples include the absence of product labelling, the failure of products to bear the conformity mark "MJ," denoting Algerian conformity, and other infractions that can be detected visually without requiring specialised expertise or advanced qualifications. Nonetheless, this does not mean that direct visual inspection alone can always ensure the full effectiveness of this procedure. In many cases, officers are unable to detect certain violations related to product compliance solely by visual observation, which necessitates the adoption of another measure: the collection of samples for analysis, testing, or examination. This will be addressed in the following section.

4. Collection of Samples for Analysis, Testing, or Examination

The collection of samples constitutes a purely administrative procedure,[14] as stipulated among the oversight measures on product compliance within the provisions of Law No. 09--03 on Consumer Protection and Fraud Prevention.

This procedure applies to products that may be subject to suspicion, those for which documentary and visual inspections have proven insufficient, or in cases where doubts arise regarding the accuracy of the information provided to supervisory authorities or officers.[15] Consequently, supervisory officers resort to the collection of samples for analysis, testing, or examination to ensure thorough oversight of product compliance.

How do supervisory officers collect samples?

The process of sample collection for analysis is carried out by the supervisory officer, who selects three homogeneous and identical samples of the product under inspection, which are then sealed. The first sample is sent to an authorised laboratory.[16] Specifically, laboratories under the ministry are responsible for consumer protection and fraud prevention, although other laboratories may also be accredited to conduct these analyses.[17]

---

[12] As in Article 44 of the Code of Criminal Procedure, which requires written authorisation issued by the Public Prosecutor or the Investigating Judge to be presented prior to entering a residence and commencing a search.

[15] *Guide de Contrôle des Appareils Électroménagers*, Direction Générale du Contrôle Économique et de la Répression des Fraudes, Ministère du Commerce, 16.
[16] See Article 40 of Law No. 09-03.
[17] See Articles 35 and 36 of the same law.

The second and third samples serve as control samples: one is retained by the supervisory authority that carried out the collection, while the relevant stakeholder remains the third. Both samples may be used if an expert examination is needed, provided that they are stored under appropriate conditions to prevent any alteration or damage.[18]

However, in the course of their duties, supervisory officers may encounter products whose nature does not permit the collection of the three aforementioned samples. In such cases where the product under inspection is perishable or its nature, quantity, weight, size, or value precludes the standard sampling procedure, a single sample is collected, sealed, and sent immediately to an authorised laboratory for analysis.[19]

Nevertheless, granting supervisory officers the discretion to collect only one sample may, in our view, constitute an infringement and violation of the stakeholders' rights in the context of exercising oversight and ensuring consumer protection. In such circumstances, the stakeholder is deprived of the right to retain a sample for possible expert review, and even the second sample, which would serve as a control, is unavailable. Thus, while product compliance monitoring procedures are designed to safeguard consumers, this objective should not justify disregarding the rights of defence of those subject to inspection.

5. Drafting Violation Reports Following Oversight Procedures

A report may be defined as a written document prepared by a duly authorised official, recording an incident in which the drafter has personally verified and investigated within the scope of their jurisdiction.[20]

Hence, the legislature, through Law No. 09--03 on Consumer Protection and Fraud Prevention, stipulates that supervisory officers, in the course of performing their oversight duties, must draft reports documenting all necessary information. These include the dates and locations of inspections conducted, a detailed account of the facts observed, the recorded violations, and the penalties prescribed for them. Furthermore, such reports must specify the identities and official capacities of the officers conducting the inspection, along with the name, surname, activity, and address of the stakeholder subject to oversight.[21]

This reporting procedure, as set out within the measures for product compliance monitoring, raises the question of the legal probative force of reports prepared by fraud prevention officers. The answer to this query is explicitly provided in Paragraph 3 of Article 31 of Law No. 09--03, which states: "The reports referred to in the preceding paragraphs shall carry legal probative force until proven otherwise."

This legal probative force accorded to reports prepared by fraud prevention officers constitutes a privilege granted by the legislature specifically to this category of reports to establish offences affecting consumer protection. This stands in contrast to the general procedural rules outlined in the Code of Criminal Procedure, under which reports drafted in felony and misdemeanour cases are generally regarded as mere pieces of evidence that the judge may choose to rely upon or disregard. Consequently, a stakeholder's denial of the facts attributed to them in such reports, even when accompanied by contrary evidence, is insufficient to invalidate their contents.[22]

Second: Administrative Powers to Take Precautionary Measures Regarding Domestic Products

Within the provisions of the Law on Consumer Protection and Fraud Prevention, the Algerian legislature not only vested supervisory officers with powers to carry out procedures in the course of their oversight duties but also grant-

[18] See paragraphs 2, 3, and 4 of Article 40 of the same law.
[19] See Article 41 of the same law.
[20] Ahmed Khadidji, *Rules of Commercial Practices in Algerian Law* (PhD diss., Faculty of Law and Political Science, University of Hadj Lakhdar Batna, defended 12 May 2016), 277.
[21] See Article 31 of Law No. 09-03.
[22] Salwa Gaddach, *The Obligation to Guarantee Products in Consumer Contracts* (previously cited), 243.

ed broader powers to the administration, through these officers, to adopt precautionary measures concerning domestic products at the market level. This section seeks to set out the principal precautionary measures available to supervisory officers to ensure compliance monitoring of products offered for consumption.

1. Product Deposits

The deposit of products constitutes a new measure not addressed by the Algerian legislature under the provisions of repealed Law No. 89--02 on consumer protection. The measure was introduced and regulated under Chapter I of Title IV of Law No. 09--03 on Consumer Protection and Fraud Prevention, which addresses precautionary measures and the principle of precaution.

A deposit consists of suspending a product offered for consumption that has been verified and found, upon direct inspection, to be noncompliant. A decision of the authority responsible for consumer protection and fraud prevention is carried out. The deposit measure is intended to ensure the compliance of products suspected of nonconformity by the stakeholder concerned. If, following inspection, the product is found to be compliant, the competent authority issues a decision lifting the deposit. In cases of noncompliance, the stakeholder may be formally notified to take appropriate corrective measures to eliminate the cause of nonconformity or to address violations of the rules and standards governing the offering of products for consumption.[23]

2. Product Seizures

As part of the precautionary measures undertaken by supervisory officers to ensure consumer protection, officers may proceed with the seizure of a product.[24] Seizures are carried out when product compliance cannot be verified or when the relevant stakeholder refuses to undergo the compliance verification process for a product suspected of nonconformity.

Seized products may then be redirected, either by being sent to a public-interest institution for direct and legitimate use, repurposed and redirected for lawful use after modification, or destroyed. These actions are accompanied by judicial proceedings as prescribed by the provisions of the Law on Consumer Protection and Fraud Prevention.[25]

Certain noncompliant but consumable goods have been redirected to public interest centers, such as the Red Crescent, solidarity centers, charitable restaurants, the Ihsan Association, the Orphan Care Association, hospitals, the National Center for Women in Difficult Situations, centers for assisted children, psycho-pedagogical centers for children with disabilities, homes for elderly individuals, and rehabilitation institutions.

Noncompliant meat has been directed to stray dog shelters, animal quarantine facilities, dog training and rehabilitation centers, and zoological parks. In this context, immediate notification of the Public Prosecutor is required in all cases of destruction, redirection, or repurposing of products.[26]

3. Temporary Withdrawal of Products

In carrying out their duties related to product compliance and in applying precautionary measures to ensure consumer protection, supervisory officers may impose the temporary withdrawal of a product.[27]

[23] See Articles 55 and 56 of Law No. 09-03.
[24] See Article 53 of Law No. 09-03, as amended by Article 2 of Law No. 18-09.
[25] See Articles 57 and 58 of Law No. 09-03.
[26] *Guide de l'Inspecteur de la Répression des Fraudes*, Direction Générale du Contrôle Économique et de la Répression des Fraudes, Ministère du Commerce, 20.

Temporary withdrawal consists of prohibiting the placement of any product for consumption, wherever it may be found, when there is suspicion of its noncompliance. This measure remains in effect pending the outcome of in-depth investigations, particularly laboratory analyses.[28] It involves the collection of samples for testing, experimentation, or verification or for obtaining documents or information not available to the holder of the product subject to inspection.[29]

Supervisory officers draw official reports, seal suspected products, and place them under the custody of the stakeholders concerned.[30]

The legislature, in turn, has stipulated that such investigations must be conducted within seven working days. If no noncompliance is proven, the temporary withdrawal is to be lifted immediately. The seven days may be extended where the technical conditions for oversight, testing, or experimentation require additional time. Should noncompliance be confirmed, the product is declared seized, and the public prosecutor must be notified without delay.[31]

By virtue of Law No. 18--09, the legislature introduced Article 61 bis, which had not been included in Law No. 09--03, providing that fraud prevention officers may also impose temporary withdrawal in cases where products are suspected of being counterfeit.

Thus, fraud prevention officers are now authorised to implement temporary withdrawal of products in two situations: first, where there is suspicion of noncompliance, and second, where products are suspected of being counterfeit.

Furthermore, Executive Decree No. 12--203, concerning the rules applicable in the field of product safety, affirms this provision. Article 15 of the decree stipulates that, at all stages of placing products for consumption, the authority responsible for consumer protection and fraud prevention should take all necessary measures to withdraw goods from the market or suspend services if they do not meet safety requirements. This is to be carried out particularly through issuing clearly worded warnings to the relevant stakeholders, indicating the risks posed by the products placed on the market and obliging the stakeholders to bring the goods into conformity.

4. Permanent Withdrawal of Products

Permanent withdrawal of products is carried out by supervisory officers without prior authorisation from the competent judicial authority in the following cases:

- Products proven to be counterfeit, fraudulent, toxic, or past their expiration date.
- Products found and confirmed to be unfit for consumption.
- Possession by a stakeholder of products without legitimate justification may be used for counterfeiting.
- Counterfeit products.
- Objects or devices used to commit acts of counterfeiting.

[27] See paragraph 2 of Article 53 of Law No. 09-03, as amended by Article 2 of Law No. 18-09 on Consumer Protection and Fraud Prevention.
[28] See Article 59 of Law No. 09-03.
[29] *Guide de l'Inspecteur de la Répression des Fraudes*, previously cited, 17.
[30] See Article 61 of Law No. 09-03.
[31] See Article 59 of the same law.

In all of the above cases, the Public Prosecutor must be notified immediately.[32]

It is thus evident that the legislature, through the provisions of the Consumer Protection Law, has empowered supervisory officers to intervene immediately without the need for prior authorisation from competent judicial authorities. This measure aims to ensure prompt action and to avoid placing obstacles in the way officers perform their duties, particularly in all the aforementioned cases, most of which concern counterfeit, fraudulent, or expired products.

5. Destruction of Products

Where it is impossible to find a lawful or economically viable use for seized or permanently withdrawn products, destruction is employed. This procedure involves applying a specific method to eliminate the product permanently. Examples include burning goods, burying them underground, chemically decomposing them, or employing other scientifically recognised methods of destruction carried out by supervisory officers in this context.[33]

Accordingly, the decision to destroy any noncompliant product, whether seized or permanently withdrawn, is made by supervisory officers.[34] In fulfilling their mandate to protect consumers, all precautionary measures, including the destruction of products, should be implemented. The order for destruction may be issued by either of two authorities: the body responsible for consumer protection and fraud prevention or the competent judicial authority. This measure must be carried out in the presence of supervisory officers and executed by the stakeholder concerned.

Destruction may also be performed by altering the nature of the product.

A destruction report must be drawn up by supervisory officers and signed by the stakeholder concerned.[35] The Public Prosecutor must be notified immediately, and the territorially competent Public Prosecutor must be informed without delay in cases where the operator refuses to comply with the destruction order for the product in question.[36]

6. Temporary Suspension of Business Activities or Administrative Closure of Commercial Premises

The temporary suspension of business activities is one of the precautionary measures that supervisory officers may adopt in the course of exercising their duties related to product compliance. This measure is provided for under Article 53 of Law No. 09--03 on Consumer Protection and Fraud Prevention. However, through Law No. 18--09, the legislature amended the aforementioned article to introduce an additional precautionary measure, namely, the administrative closure of commercial premises.[37]

In accordance with the provisions of the Consumer Protection and Fraud Prevention Law, consumer protection and fraud prevention authorities may impose a temporary suspension of business activities or an administrative closure of commercial premises for a period not exceeding fifteen days. This period may be renewed in cases where noncompliance with the rules established under the Consumer Protection and Fraud Prevention Law is confirmed and the measure shall remain in effect until all causes that led to the imposition of the temporary suspension of business activities or administrative closure of commercial premises have been fully remedied.[38]

---

[32] See Article 62 of Law No. 09-03.
[33] Salwa Gaddach, *The Obligation to Guarantee Products in Consumer Contracts* (previously cited), 249.
[34] *Guide de l'Inspecteur de la Répression des Fraudes*, previously cited, 20.
[35] See Article 64 of Law No. 09-03.
[36] *Guide de l'Inspecteur de la Répression des Fraudes*, previously cited, 20–21.
[37] The Algerian legislature also provided for the administrative closure of commercial premises in Article 46 of Law No. 04-02 of 23 June 2004, Establishing the Rules Applicable to Commercial Practices, *Official Gazette* No. 41 (27 June 2004), as amended and supplemented by Law No. 10-06 of 15 August 2010, *Official Gazette* No. 46 (18 August 2010).
[38] See Article 65 of Law No. 09-03, as amended by Article 3 of Law No. 18-09.

Following the presentation of the administrative authority's full range of precautionary powers concerning domestic products, it is necessary to address, in conclusion, the issue of expenses arising from the precautionary measures outlined above.

Under Article 60 of Law No. 09--03, prior to its amendment, the legislature distinguished between two scenarios concerning the payment of expenses:

- The first concerns cases where noncompliance is established. In such instances, the negligent stakeholder is required to bear the costs resulting from oversight operations, analyses, tests, or examinations.

- The second applies where noncompliance is not proven through analyses, tests, or examinations. In this case, the legislature did not oblige the stakeholder to cover these costs. Instead, the value of the sample was reimbursed to the stakeholder on the basis of the value recorded and documented in the sampling report.

This was how the legislature addressed the issue of expenses under Law No. 09--03 before its amendment. However, this approach was abandoned when Article 60 of Law No. 09--03 was repealed by Article 18 of Law No. 18--09 on Consumer Protection and Fraud Prevention.

The expenses arising from the implementation of measures such as product deposit, analyses, tests, examinations, corrective actions to restore compliance, temporary withdrawal, redirection, repurposing, seizure, and destruction are now borne by the stakeholder.[39] Regardless of whether the analyses, tests, or corrective measures ultimately confirm noncompliance.

In contrast, in regard to redirection, repurposing, seizure, and destruction, there is no question of the absence of noncompliance, as the circumstances warranting the application of these measures have already been established. In such cases, the confirmation of noncompliance is a prerequisite, and the negligent stakeholder is unequivocally required to bear the associated costs.

Section Two: Administrative Oversight of Imported Product Compliance at Border Points

In addition to monitoring product compliance at the market level, the legislature has extended oversight to border points concerning the verification of imported product compliance.

The legislature has set forth conditions for exercising this type of oversight, mandating that it be conducted prior to the customs clearance of imported goods. Furthermore, this verification must be carried out in accordance with established priorities, taking into account the specific nature of the product under inspection. In parallel, this responsibility has been assigned to specialised bodies, along with specific procedures for the administrative oversight of product compliance at border points (First).

On the basis of the findings resulting from these procedures, supervisory officers are empowered to adopt precautionary measures applicable to imported products at border points (Second).

First: Oversight Bodies and Procedures for Administrative Monitoring of Imported Product Compliance at Border Points

[39] See Article 66 of Law No. 09-03, as amended by Article 5 of Law No. 18-09 (whereby the legislature added the clause "the stakeholder shall bear the costs arising from ... analyses, tests, or examinations," which had not been included in Article 66 prior to the amendment).

Public authorities have established essential conditions to ensure the compliance of products entering Algeria, particularly in light of the recent rise in fraudulent practices and the importation of noncompliant goods.[40] Therefore, the legislature has stipulated that products that are not marketed in their country of origin due to failure to meet safety requirements may not be placed on the national market.[41]

On this basis, the legislature has sought to combat such violations through administrative oversight by creating specialised bodies responsible for monitoring compliance at border points, alongside establishing specific procedures governing the administrative oversight of imported products.

1. Oversight Bodies at Border Points

Pursuant to the provisions of Executive Decree No. 05--467, which sets out the conditions and procedures for monitoring the compliance of imported products at border points,[42] Article 2 states that compliance oversight of imported products is carried out at land, sea, and air border checkpoints by border inspectorates under the authority responsible for consumer protection and fraud prevention. In addition, customs services also play a crucial role not only in safeguarding state borders in terms of security and economic control but also in protecting consumers by preventing the entry of counterfeit and fraudulent goods and monitoring their circulation.[43]

In addition to the aforementioned authorities, the role of fraud prevention officers under the Ministry of Commerce must also be emphasised. Thus, administrative oversight at border points, aimed at ensuring product compliance, is conducted in coordination among the following bodies:

A. Border Inspectorates under the Authority Responsible for Consumer Protection and Fraud Prevention

In the application of Article 6 of Executive Decree No. 11--09, which regulates the organisation, powers, and functions of the external services of the Ministry of Commerce, the legislature mandated that the Directorate of Commerce at the wilaya (provincial) level be equipped with inspectorates for quality control and fraud prevention at land, sea, and air border points, as well as in bonded zones and warehouses. The staffing of these inspectorates is determined according to the volume of goods transiting through each area, with the possibility of equipping these inspectorates with inspection teams as necessary.[44]

The Regional Inspectorate of Commerce and the Inspectorate for Quality Control and Fraud Prevention at land, sea, and air border points are established by a joint decree between the Minister of Commerce, the Minister of Finance, and the authority responsible for the civil service.[45] In this regard, and in application of the provisions of Article 6 mentioned above, the Joint Ministerial Decree of 13 November 2011 was issued, establishing inspectorates for quality control and fraud prevention at land, sea, and air border points, as well as in bonded zones and warehouses.[46]

[42] Executive Decree No. 05-467 of 10 December 2005 Setting the Conditions and Procedures for Monitoring the Compliance of Imported Products at Border Points, *Official Gazette* No. 80 (11 December 2005).
[43] Samah Mahmoudi and Nabil Nougui, "Oversight as a Mechanism to Protect Consumers from the Risks of Non-Compliant Products," in *The Legal System of Consumer Protection in Algerian and Comparative Legislation*, Collective Work, Law and Local Development Laboratory, University of Adrar, Algeria, September 2020, 147.
[44] See Joint Ministerial Decree of 22 September 2014 Defining the Number of Inspection Teams in the Wilaya Directorates of Commerce, Regional Inspectorates, and Inspectorates for Quality Control and Fraud Prevention at Land, Sea, and Air Borders, and in Bonded Zones and Warehouses, *Official Gazette* No. 66 (9 November 2014).
[45] See Article 6, paragraph 2, of Executive Decree No. 11-09 of 20 January 2011 Organising the External Services of the Ministry of Commerce, Their Powers, and Operations, *Official Gazette* No. 4 (23 January 2011).
[46] Joint Ministerial Decree of 13 November 2011 Establishing Inspectorates for Quality Control and Fraud Prevention at Land, Sea, and Air Borders, and in Bonded Zones and Warehouses, *Official Gazette* No. 24 (25 April 2011).

According to Article 2 of this decree, fifty inspectorates for quality control and fraud prevention were created at land, air, and sea border points, in addition to bonded areas and warehouses. The Regional Inspectorate of Commerce and the Inspectorate for Quality Control and Fraud Prevention are managed at these locations by the heads of inspectorates, who are assisted in their duties by the heads of inspection teams.[47]

The duties of the heads of inspectorates include endorsing and stamping authorisations for the entry of products found to be compliant following the completion of inspection procedures, as well as endorsing and stamping decisions of refusal in cases of noncompliance. They are also responsible for reviewing appeals submitted by importers in the event of a refusal decision. Where a violation is confirmed, the heads of inspectorates refer the case to the competent judicial authorities.[48]

B. Customs Administration Services

Border crossings hold significant importance for every state, as they control the movement of individuals and goods. In this context, the customs administration plays a crucial role, serving as the first line of defence and the first government body to receive and inspect incoming shipments. Its role is particularly vital.[49] The compliance of imported products entering national borders should be ensured.

The customs administration is entrusted with several clearly defined tasks, foremost among them being the verification that imported or exported goods have undergone compliance inspection procedures in accordance with the applicable legal and regulatory framework.[50]

Upon the arrival of imported products ,whether newly imported, reimported, or intended for export, these goods must be presented to the competent customs office for customs inspection. This process ensures that goods comply with established oversight regulations and prevents the unlawful import of noncompliant products.

2. Procedures for Administrative Oversight of Product Compliance at Border Points

Administrative oversight at border points about product compliance is conducted in the same manner as for equivalent domestically produced goods, ensuring that inspection procedures do not compromise the quality or safety of the product.

Consequently, border inspections of imported goods focus on documentary verification or visual inspection of the products, which the collection of product samples may supplement.[51] These procedures are outlined below.

A. Documentary Verification

Border inspections of imported products begin with documentary verification as the initial procedure. This is conducted on the basis of the file submitted by the importer or their legally authorised representative to the relevant border inspectorate. The file must include the following documents:[52]

[49] El-Sadeq Sayad, *Consumer Protection under the New Law No. 09-03 on Consumer Protection and Fraud Prevention* (Master's thesis, Faculty of Law, University of Constantine 1, 2013–2014), 113.
[50] See Article 2 of Law No. 17-04 of 16 February 2017, Amending and Supplementing Law No. 79-07 Constituting the Customs Code, *Official Gazette* No. 11 (19 February 2017).
[51] See Article 6 of Executive Decree No. 05-467 of 10 December 2005 Setting the Conditions and Procedures for Monitoring the Compliance of Imported Products at Border Points, *Official Gazette* No. 80 (11 December 2005).
[52] See Article 3 of the same decree.

- An import declaration prepared by the importer in due form, containing detailed information about both the importer and the imported product.[53] This declaration must be signed and stamped by the importer and acknowledged by the border inspectorate, with all the information provided therein required to be accurate.

- A certified true copy of the extract from the commercial register.

- A certified true copy of the invoice.

- The originality of any other document required under the applicable regulations related to the conformity of imported products.

At this stage, the supervisory officer carefully examines all the documents accompanying the product. Once the documentary verification process is complete, the officer proceeds with a physical inspection consisting of a direct visual examination of the goods.[54]

B. Visual inspection of products

According to the provisions of Executive Decree No. 05--467, which sets forth the conditions and procedures for monitoring the compliance of imported products at border points, Article 7 provides that visual inspection is conducted to ensure the following:

- The product's compliance with legal or regulatory specifications.

- The product's compliance with conditions of use, transportation, and storage.

- The product's conformity with labelling information and/or accompanying documentation.

- The absence of any damage or potential contamination of the product.

If compliance with the imported product cannot be confirmed following documentary verification or visual inspection or if doubts regarding noncompliance persist, the procedure proceeds to the next step: **sample collection**.

C. Sample collection

When visual inspection by authorised officers necessitates sample collection, this procedure may take two forms. The most common method involves the collection of three homogeneous samples representative of the inspected batch. Alternatively, in exceptional circumstances such as perishable goods, or owing to the product's nature, weight, limited quantity, or high value, a single sample may be collected.[55]

The first sample is sent to an authorised laboratory for analysis. In contrast, the second and third samples are retained as control samples, one kept by the supervisory authority that carried out the sampling and the other by the stakeholder concerned.[56]

[53] See Article 2 of the Decree of 14 May 2006, Defining the Templates and Content of Documents Related to the Oversight of Imported Product Compliance at Border Points, *Official Gazette* No. 52 (20 August 2006), as amended.
[54] *Guide de Contrôle des Appareils Électroménagers*, Direction Générale du Contrôle Économique et de la Répression des Fraudes, Ministère du Commerce, 15.
[55] *Guide de l'Inspecteur de la Répression des Fraudes*, previously cited, 24.
[56] See Article 40 of Law No. 09-03.

Following the aforementioned sampling procedure, the sample is immediately transported, under conditions that prevent damage or deterioration of the product under inspection, to an accredited laboratory for the purpose of conducting analyses, tests, and examinations to determine the product's compliance status. The results of the inspection must be communicated by the relevant border inspectorate within forty-eight hours, counting from the date on which the importer or their legal representative submitted the file to the border inspectorate, and this must take place prior to the customs clearance of the imported goods.

This period may be extended if the analyses, tests, and examinations require additional time; however, the extension may not exceed the maximum period prescribed by regulations for the storage or temporary deposit of imported goods.[57]

The legislature's rationale for imposing these deadlines lies in the need to prevent the accumulation of imported goods at border points while ensuring that supervisory officers deliver timely decisions on each importer's file within reasonable timeframes, thereby avoiding harm to both the importer and the goods awaiting test results. The legislature acted wisely in setting these short deadlines while simultaneously allowing the use of private laboratories, in addition to state-accredited laboratories, to expedite the analysis and testing of samples under examination.

Second: Precutionary Measures Applied to Imported Products at Border Points

Supervisory officers at border points are authorised to take all the precautionary measures necessary to protect consumers from the risks posed by noncompliant products. These measures are determined on the basis of the outcomes of document verification, visual inspection, or sample collection and testing. These procedures lead to the application of two possible measures: the first is conditional authorisation for the entry of imported goods at border points; the second, which is the opposite measure, is the outright refusal of entry for imported goods at border points. These issues are discussed below.

1. Conditional Authorisation for Imported Goods at Border Points

Under Law No. 09-03 on Consumer Protection and Fraud Prevention, prior to its amendment, Article 53 suggested that supervisory officers could impose a temporary refusal of entry for goods at border points where there was suspicion of noncompliance.

The legislature subsequently amended Article 53[58] of Law No. 09--03 through Article 2 of Law No. 18--09 on Consumer Protection and Fraud Prevention. In this amendment, the term "temporary refusal of entry" was replaced with the concept of "conditional entry authorisation" for imported goods at border points.

Supervisory officers now declare conditional entry authorisation for imported goods at border points to verify their compliance within bonded areas, specialised institutions, or the importer's premises, provided that compliance verification does not pertain to the safety and security of the product. Furthermore, products subject to conditional entry authorisation may not be placed on the market for consumption until their compliance has been fully verified.[59]

---

[57] See Articles 12, 13, and 14 of Executive Decree No. 05-467, Setting the Conditions and Procedures for Monitoring the Compliance of Imported Products at Border Points.

[58] This article was amended following proposals made by representatives of the Customs Administration during their presentation before the members of the Economic, Industrial, and Commercial Affairs and Planning Committee of the National People's Assembly, in the presence of the Director General of Customs. The amendment replaced the term "temporary entry" of imported goods with a more precise expression to ensure effective customs operations in the field and to prevent legal loopholes that could be exploited for illicit purposes. The representatives also proposed several amendments to strengthen consumer protection and safeguard the national economy. These discussions took place during the debate on Law No. 09-03 on Consumer Protection and Fraud Prevention before the National People's Assembly. See article published on the Algerian Press Service website, 2 February 2018, https://www.aps.dz/ar/economie/52827-2018-02-02-17-53-10

[59] See Article 2 of Law No. 18-09, amending Article 54 of Law No. 09-03.

Compliance verification, in cases where noncompliance relates to the intrinsic quality of the product, is carried out by eliminating the cause of nonconformity in accordance with applicable regulations or in the manner authorised by the regionally competent directorate.

Compliance verification may also take the form of downgrading the product's classification, redirecting it for processing, or repurposing it for a different use, provided that these corrective actions do not damage the quality of the product.[60]

The compliance verification process is conducted under the supervision of the consumer protection and fraud prevention authorities at the location where the verification takes place. Once this process is completed and all causes of noncompliance are fully resolved, the relevant border inspectorate issues an authorisation for the entry of the imported product. If compliance verification is not carried out within the required timeframes at the specialised institution or the importer's warehouses, the noncompliant product is seized.[61]

Supervisory officers may also, without the need for sample collection and based solely on the aforementioned documentary verification or visual inspection of the product, grant authorisation for the entry of the product. The competent border inspectorate issues this authorisation if no violation is detected.[62]

Accordingly, to revise the previously adopted model of "product entry authorisation," the legislature issued the decree of 19 November 2019.[63] The decree of May 2006 defines the templates and content of documents related to the inspection of imported products at border points. This decree introduced a standardised model for conditional entry authorisation for products, which must be used by supervisory officers when issuing such decisions.

Thus, conditional entry authorisation is prepared by supervisory officers for the purpose of verifying compliance. This document records all relevant information concerning the importer, details of the imported product subject to inspection, and a description of the inspections carried out. On the basis of these inspections, conditional entry for compliance verification is granted, with the head of the border inspectorate endorsing and stamping the authorisation, specifying the date of issuance.

2. Final Refusal of Entry for Imported Products at Border Points

In addition to conditional entry authorisation for imported goods at border points, a further measure may be imposed in cases of noncompliance: the final refusal of entry for imported products at border points. Article 53 of Law No. 09-03 on Consumer Protection and Fraud Prevention (as amended and supplemented) provides that supervisory officers may take all the precautionary measures necessary to protect consumers, including the final refusal of entry for imported goods at border points. This measure is declared when noncompliance is established, either through visual inspection or thorough investigations.[64]

It is applied in cases where violations are detected during documentary verification, visual inspection, or after confirmation through sample testing. In such cases, the competent border inspectorate issues a formal decision of refusal of entry, clearly stating the reason for the refusal.[65]

---

[60] See Article 19 of Executive Decree No. 05-467, Setting the Conditions and Procedures for Monitoring the Compliance of Imported Products at Border Points.
[61] See Articles 20 and 21 of the same decree.
[62] See Article 9 of the same decree.
[63] Decree of 19 November 2019 Supplementing the Decree of May 2006, Defining the Templates and Content of Documents Related to the Oversight of Imported Product Compliance at Border Points, *Official Gazette* No. 8 (16 February 2020).
[64] See Article 54 of Law No. 09-03.
[65] See Article 9 of Executive Decree No. 05-467, Setting the Conditions and Procedures for Monitoring the Compliance of Imported Products at Border Points.

Supervisory officers draft the decision of refusal of entry. They must include detailed information about the importer and the imported product, along with a record of the various inspection procedures carried out. It is also mandatory for the decision to clearly state the reasons for refusal.[66]

However, under the provisions of Executive Decree No. 05--467, which sets forth the conditions and procedures for monitoring the compliance of imported products at border points, Article 10 grants importers the right to appeal a decision of final refusal of entry for their imported goods. This appeal may be exercised through a three-tier process:

A. Appeal by the Importer Against the Reason for Refusal of Entry Before the Competent Wilaya Directorate of Commerce

The importer or their legally authorised representative may file a legally substantiated appeal with the territorially competent wilaya Directorate of Commerce. This right enables the importer to contest the grounds for the refusal of entry, and the details of the appeal are recorded in a hearing report.

To exercise this right, the importer must submit the appeal within eight days, counted from the date on which supervisory officers notified them of the refusal of entry. The wilaya Directorate of Commerce then has a period of four working days to review the reasons outlined in the appeal. If the appeal is found to be legally sound and well founded, the refusal decision is overturned. If, however, the review of the appeal, as documented in a detailed report, confirms the findings on which the refusal decision was based, the refusal is upheld.[67]

B. Appealing by the Importer Against the Reason for Refusal of Entry Before the Competent Regional Directorate of Commerce

If the importer remains determined to exercise their right to appeal the decision of refusal of entry and fails in having the decision overturned by the territorially competent wilaya Directorate of Commerce, the legislature, pursuant to the provisions of Executive Decree No. 05--467 and Article 15 thereof, grants the importer the right to submit an appeal to the territorially competent regional Directorate of Commerce. This appeal concerns the disposition of the noncompliant product, whether for compliance verification, repurposing, re-export, or destruction. The regional Directorate of Commerce has five working days to decide on the appeal submitted at its level.

C. Notification by the Importer to the Central Authority Responsible for Consumer Protection and Fraud Prevention Regarding the Refusal of Entry

If the importer receives no response to their appeal or if the response is not delivered within the prescribed timeframe, they may notify the central authority responsible for consumer protection and fraud prevention to obtain a final decision on their request.[68]

Thereafter, the relevant border inspectorate is notified of the cancellation of the decision to refuse entry of the product. Suppose the imported product is found to be noncompliant. In that case, the border inspectorate that ordered the refusal of entry should transmit a copy of this decision to the customs services at the point where the imported product entered the national territory.[69]

---

[66] See Article 5 of the Decree of 14 May 2006, Defining the Templates and Content of Documents Related to the Oversight of Imported Product Compliance at Border Points, *Official Gazette* No. 52 (20 August 2006), as amended.
[67] See Articles 10 and 11 of Executive Decree No. 05-467, Setting the Conditions and Procedures for Monitoring the Compliance of Imported Products at Border Points.
[68] See Article 16 of Executive Decree No. 05-467, Setting the Conditions and Procedures for Monitoring the Compliance of Imported Products at Border Points.
[69] See Articles 11 and 24, paragraph 2, of the same decree.

However, after the importer's right to appeal against a decision refusing entry of a product under the provisions of Executive Decree No. 05--467, which sets the conditions and procedures for monitoring the compliance of imported products at border points, this right has been granted in an absolute and undefined manner. The legislature has merely required that the appeal be legally substantiated, without specifying the circumstances in which the importer may or may not exercise this right. In our view, it would be preferable for the legislature to clearly determine the cases in which an appeal is permissible and those in which it is not. For example, when supervisory officers conduct inspections through documentary verification or visual observation, it is reasonable to recognise the importer's right to appeal, given that errors in assessing compliance may occur. However, once samples have been collected and analysed by specialised laboratories, it cannot reasonably be argued that such results remain challenging. It would therefore be desirable for the legislature to address and clarify this point, establishing the circumstances under which appeals are admissible to avoid unnecessary delays and the excessive number of appeals submitted by importers.

Moreover, in this context, an additional penalty has been established for violations of precautionary measures to ensure their integrity and prevent interference by stakeholders, whether at the market level or at border points. Article 155 of the Penal Code[70] Criminalises the intentional breaking of seals affixed by the order of a public authority or any attempt thereof. Where the breaking of seals, or an attempt to do so, is committed by the designated custodian, or through the use of violence against persons, or with the intent to steal or destroy evidence or legal documents in criminal proceedings, the offense is punishable by imprisonment for a term of two to five years.

Furthermore, Article 79[71] of Law No. 09-03 on Consumer Protection and Fraud Prevention (as amended and supplemented) provides that any person who sells a product that has been sealed, deposited for compliance verification, temporarily withdrawn from the market, or who violates an order for temporary suspension of activity or administrative closure of commercial premises shall be punished by imprisonment for a term of six months to three years and a fine ranging from five hundred thousand to two million Algerian dinars or by one of these two penalties.

On the basis of all the above, and pursuant to Article 12 of Law No. 09--03 on Consumer Protection and Fraud Prevention, the legislature has required stakeholders to exercise prior self-monitoring in addition to affirming the powers of the administration to carry out such oversight and adopt appropriate precautionary measures accordingly.

At the same time, the administration must act with reasonableness and proportionality in exercising the oversight powers conferred upon it so as not to deviate from its legitimate objectives and risk an abuse of authority. Notably, all the aforementioned measures and their consequences do not preclude negligent stakeholders from being subject to civil and criminal liability.[72]

Conclusion:

This study demonstrates that administrative oversight of product compliance constitutes one of the fundamental pillars of the consumer protection framework in Algeria, enabling administrative authorities to intervene directly both at the market level and at border points. With respect to domestic products, procedures such as inspection, examination, and sampling have proven important in the early detection of violations, a process further strengthened by the administration's powers to adopt precautionary measures, including seizure, withdrawal, or even destruction. For imported products, the pivotal role of overseeing bodies at border points is evident through strict procedures that may culminate in either conditional entry or final refusal.

On this basis, the following findings and recommendations can be drawn:

[70] Ordinance No. 66-156 of 8 June 1966, Constituting the Penal Code, *Official Gazette* No. 49 (11 June 1966), as amended and supplemented.
[71] Article 79 of Law No. 09-03 was supplemented by Article 9 of Law No. 18-09.
[72] Mohamed Imad Eddine Ayad, *The Consumer Contract in Algerian Legislation* (previously cited), 401.

- Administrative oversight is an effective mechanism for limiting the circulation of noncompliant products.
- The effectiveness of oversight is contingent upon strengthening coordination among various regulatory bodies.
- It is essential to equip oversight agencies with advanced technical means to facilitate swift and accurate detection.
- The imposition of stricter penalties on offenders is crucial to ensuring effective deterrence and enhanced consumer protection.

In conclusion, fostering a culture of effective oversight of both domestic and imported products represents a genuine safeguard for consumer protection and the preservation of the state's economic public order.

Acknowledgment

The author expresses sincere gratitude to the Faculty of Law and Political Science, University Kasdi Merbah Ouargla, Algeria, for providing the academic environment and resources that facilitated the development of this research. Special thanks are extended to colleagues and peers who contributed through constructive discussions and feedback during the preparation of this paper.

Issue web link https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html

Keywords Phonetics, Al-Mar'ashi, Juhd al-muqil, Anatolian scholars, Praat.

Abstract
Arabic phonetics, like other linguistic sciences, has gone through various stages, beginning with the early beginnings of linguists and grammarians in the first century AH (seventh century AD) with al-Du'ali and his companions. The study of Arabic phonetics was not limited to Arab scholars or those from the Arabian Peninsula; rather, it extended to all scholars belonging to the Islamic civilization as its geographic scope expanded. The most prominent of these scholars were the scholars of the Anatolian region, especially during the Ottoman era, including Muhammad ibn Abi Bakr al-Mar'ashi. The study aims to focus on his most prominent phonetic contributions to the Arabic language and the extent of their novelty and innovation compared to his predecessors. The importance of this research paper lies in its focus on Al-Mar'ashi's phonetic innovations, strengthening the study in some phonetic aspects with analytical data from the popular Praat program..

1. Introduction:

The first beginnings of Arabic phonetic studies were manifested with the first century of Hijri history; that is, in the seventh century AD, its origin was not as an independent science, but its material and its beginnings appeared as a way to reach non-phonetic goals and objectives, and because most of the sciences among the Arabs at that time had religious purposes, namely, to understand the Holy Quran, being the Holy Book of Muslims and their first source of Islamic legislation, as well as to understand the noble Hadith because it is the second source of legislation among Muslims as well, because it is the second source of legislation among Muslims, and and this understanding is only through Therefore, one of the first Arabic linguistic Sciences that appeared was the science of grammar and lexicography, so that the first would be a standard keeper of the Arabic system of displacement, and the second would preserve the Arabic vocabulary structure and meaning‹Among the first grammatical studies we find the famous story of Abu Al-Aswad Al-Du'ali with his servant when he said to him: "If you see me open my mouth with a letter, then put a dot above it on top of it. If I close my mouth, then put a dot in front of the letter. If I break it, then put the dot under the letter. If you follow something of that with a nasal sound, then put two dots in place of the dot."(Abu Sa'id al-Sirafi, 1966, 13)

We also find among the first lexical studies the book Al-Ayn by Al-Khalil bin Ahmad Al-Farahidi. It may come to mind to ask about the relationship between what we have mentioned and phonetic studies. When we contemplate the origin of the two sciences, we find it to be purely phonetic, through the construction of the science of grammar at the beginning - starting from the aforementioned story - on the phonetic side in the position of the articulation

apparatus, the movement of the lips, and the mechanism of producing consonants and short vowels such as fatha, damma, and kasra, and through the construction of Al-Khalil's dictionary of 'Ayn on a phonetic basis that appears in its title and in the reason for the name, which is on a purely phonetic basis through Al-Khalil's choice of the first of the fixed consonants as a point of articulation and description in the case of singular or compound, which is the sound of 'Ayn. Or we find the phonetic side also in the introduction to the dictionary through Al-Khalil's definition of the points of articulation and descriptions of Arabic sounds, as they are the material of the Arabic word. This reminds us of Ibn Jinni's definition of language in his book Al-Khasais when he makes it essentially "sounds" in his saying: "As for its definition They are sounds through which every people express their purposes"(Ibn Jinni,1/ 34).

The vocal material is the basis of human language, and therefore all encyclopedias define it as having primarily vocal material. Britannica says in its latest update on 07/17/2025: language, a system of conventional spoken, manual (signed), or written symbols by means of which human beings, as members of a social group and participants in its culture, express themselves. The functions of language include communication, the expression of identity, play, imaginative expression, and emotional release.[1]

The Oxford Dictionary also defines language by referring to its phonetic principle, as it defines it: LANGUAGE: a system of communication consisting of sounds, words, and grammar:[2]

In this research paper, we will work on enumerating Al-Mar'ashi's most prominent contributions to Arabic phonetic studies, in what we see as a new contribution or a scientific innovation that has not been preceded by any of the previous phonetic works we have seen. Although there are previous studies that intersect with this study, we have tried to determine what highlights the man's creativity in the study of phonetics, because he is the greatest determinant of the extent of the contribution made in this field of Arabic sciences. Herein lies the importance of the study, and before embarking, it is necessary to introduce and present what the situation was like before Al-Mar'ashi.

2. The Pre-Mar'ashi Era:

We previously mentioned that the Arabs addressed several aspects of phonology in their study of grammar and lexicography. In the introduction to Mu'jam al-'Ayn, we find al-Khalil discussing the articulation points and characteristics of Arabic sounds. (Al Khalil,1/ 51).

We then find his student Sibawayh in more detail in the book when he discusses morphological issues and the phenomenon of idgham, which modern scholars call total phonetic similarity. He lists the correct spoken Arabic sounds and the incorrect ones, which are not considered desirable in the Quran or poetry. He also explains the articulation points of Arabic consonants and vowels, both short and long. According to him, there are 16 articulation points. He then explains the set of phonetic characteristics that characterize Arabic sounds, classifying them into opposing and non-opposing groups, including voiced, unvoiced, stressed, soft, and others. (Sibawayh,1988,431).

Arabic linguists continue to address phonetic issues in the service of grammar and morphology. We hardly find the independence of Arabic phonetics in its subject matter, methodology, and objectives until Ibn Jinni in the fourth century AH and the end of the tenth century AD (d. 392 AH) (zirkli,2002,204). through his book, (sir sina't al-I'rab)

However, we find the independence of phonetic issues from the linguistic sciences before Ibn Jinni, albeit by a short period, through the emergence of the science of Tajweed. We trace the beginnings of phonetic studies, making linguistic sounds the subject and objective of the study, to the authors of Tajweed books. Perhaps the first to write on it, specifying its terminology, topics, and objectives, was Abu Bakr al-Shidhai, who died in 373 AH, and it was said in 370 AH(Ibn al-Jazari,2006, 1/131).; that is, 19 years before the death of Ibn Jinni. His sheikh, Ibn Mujahid, who died in 324 AH, preceded him in mentioning some phonetic issues related to errors in the vocal performance of Arabic linguistic sounds when reciting the Qur'an.

3. Al-Mar'ashi and his scientific phonetic efforts:

[1] https://www.britannica.com/topic/language
[2] https://dictionary.cambridge.org/us/dictionary/english/language

The science of Tajweed developed, like any other science, moving from its foundational stage to its maturity and innovation. The spread of Islam in the non-Arab countries neighboring the Arabian Peninsula was the most important reason for the spread and development of the science of Tajweed, due to Muslims' need for it to pronounce the words of the Holy Quran correctly and without errors, whether singular or compound. Based on this, we can understand the abundance of Tajweed and recitation scholars in non-Arab cities near the Arabian Peninsula, including the Anatolian region, which was famous for its scholars of Tajweed and recitation. No one today discusses the phonetic studies of Tajweed scholars without mentioning Ibn al-Jazari, who died around 1430 CE. Ibn al-Jazari is considered the reference for all subsequent Tajweed scholars. He was originally from Anatolia and was nicknamed Ibn al-Jazari after "Al-Jazira" or "Ibn Umar Island," which is currently the Cizre region of Turkey. Among the Anatolian scholars who studied Arabic sounds through their compositions of Tajweed books or their grammatical commentaries and compositions, we find Muhammad ibn Mahmud ibn Ahmad, known by the nickname "Dabbaghzadeh," who died around 1702 AD. (Reda Kahala,11/ 313).

He was a scholar of grammar and interpretation, and he was the Sheikh of Islam in Turkey. Among the Anatolian scholars is also Muhammad ibn Abi Bakr al-Mar'ashi, known by the nickname "Sajkli Zadeh," who died around 1737 AD. He is the subject of this research paper, and we will talk about him and his compositions later. We find Mustafa ibn Abd al-Rahman al-Izmiri, who died around 1743 AD. The nickname "Izmiri" is in reference to the İzmir region in Turkey. He was a scholar of readings and one of the most important and prominent scholars in the region after al-Mar'ashi. We also find among the Anatolian scholars Hussein ibn Ahmad al-Barsawi, known by the nickname "Zini Zadeh," who died around 1758 AD. The nickname "al-Barsawi" is in reference to the region of Bursa is currently in Turkey. (Al Hossein ibn ahmed, 2019, 31).

Let's return to al-Mar'ashi, the subject of this research paper. Muhammad ibn Abi Bakr al-Mar'ashi was a man of knowledge and religion. He was born in the city of Mar'ashi, located in southern Turkey today. Its current administrative name is Kahramanmaraş, meaning "heroic Maraş," in honor of its resistance to the French occupation. It is a historical center rooted in successive civilizations, including the Islamic civilization. During the Ottoman era, it was famous for its religious schools. Ghanem Qaddouri al-Hamad mentioned some of these schools in his introduction to al-Mar'ashi's book, "juhd al-muqil." (al-Mar'ashi, 2008, 12).

Al-Mar'ashi lived a scholarly life in this great scholarly city, which was full of teachers and schools, which contributed to his strong and diverse scholarly upbringing, so he became a teacher of Arabic sciences, including jurisprudence, interpretation, and intonation. Among his most famous works are the book "Juhd al-Muqil" on the science of intonation, and a commentary on the book called "Bayan Juhd al-muqil," the book "Tahdhib al-Qira'at al-'Ashr," and the book "Taritib al-'Ulum," in which he discusses the various sciences and arranges them according to importance and what is related to teaching and learning them. (Ismail al-Baghdadi, 322).

He also wrote many other diverse books due to the diversity of his scholarly interests, such as books on the science of debate and logic, which had a great impact on establishing the phonetic issues in his books, especially the book "Juhd al-muqil." Whoever examines this book will find a detailed account of phonetic issues and quotes from others who preceded him. Most notable of these are his own opinions and analyses of some phonetic issues that were not detailed before him, or Ambiguous as that related to the chapter on the exits of sounds and their characteristics, as we will explain.

4. Subtle Phonetic Issues in Al-Mar'ashi's "Juhd al-muqil:"

In this section of the research paper, we will present a number of contributions to phonetics based on Al-Mar'ashi's book "Juhd al-muqil." We will focus on those that are novel and innovative, or those that demonstrate the strength of scientific grounding compared to those that preceded them.

4.1 Terminological Boundaries between the Sciences of Tajweed and Recitation:

Al-Mar'ashi emphasized the need to clarify the semantic boundaries between the science of Tajweed and the science of recitation, despite their close connection. This is because the science of Tajweed cannot exist without the presence of the science of recitation, given that the subject of the science of Tajweed is the Qur'anic text in its vocal performance. This science cannot exist without its established corpus—I mean the Holy Qur'an through the regulation of the Qur'anic recitations. Al-Mar'ashi also realized the need to clarify the concept of the science of

Tajweed at the beginning of the book, immediately after the introduction. To clarify for the reader what phonetic issues he will mention related to the science of Tajweed and what he will leave out due to its connection to the science of recitation, he says: "If you ask: What is the difference between the sciences of Tajweed and Qira'at? I say: The science of Qira'at is a science in which the differences of the imams of different regions in the arrangement of the Qur'an are known, whether in the letters themselves or in their characteristics. If something about the nature of the characteristics of the letters is mentioned in it, then it is a completion, since the purpose is not related to it. As for the science of Tajweed, its purpose is to know the nature of the characteristics of the letters. If something about the differences of the imams is mentioned in it, then it is a completion." Thus, Al-Mar'ashi systematically and scientifically establishes the phonetic issues he will study, or what can be expressed in the language of science as defining the concept and subject of this science.

4.2 The Concept of Sound and Air:

Al-Mar'ashi mentions the views of his predecessors, such as Sibawayh, Mulla Ali al-Qari, and Ahmad ibn Muhammad ibn al-Jazari, in his definition of sound, breath, and the relationship between them. He then provides a summary of his precise understanding of the concept of sound and the mechanism of its production. He states that sound is audible air. This indicates that air never becomes sound before passing through the larynx, and that the origin of sound is air. This phonetic analysis is completely consistent with the definitions indicated by international dictionaries. The Encyclopedia Britannica, in its most recent edition, defines the term "phonetics" as the beginning of sound production through the passage of air from the lungs. A Dictionary of Phonetics and Phonology also defines the consonant and confirms the above, stating:

consonant /lkDns˜n˜nt/ n. 1. (also contoid) In phonetics, a segment whose articulation involves a significant obstruction to air flow in the vocal tract. (Trask, 1996, 87).

We should not overlook the fact that Al-Mar'ashi refers to the issue of the vocal cords vibrating and not vibrating when air passes over the larynx. He calls the air that vibrates the vocal cords "audible breath," while the air that does not vibrate with them is called air.

4.3 Consonants and Vowels:

Al-Mar'ashi stated that consonants are essentially formed by stress and interruption, whether that interruption is weak or strong, as he says: "All letters, except for the long alif, share the same basic reliance on the point of articulation, but vary in the strength of that reliance." Immediately following this text, he compares consonants and vowels, clearly defining the difference between consonants and vowels, stating that the air rushing in clearly interrupts the sound, while the interruption is much less or nonexistent in vowels. Therefore, he excluded the long alif in the previous definition. Because it is an extended sound without interruption, there is no difference between what Al-Mar'ashi mentioned and what we find in our time in terms of an analysis of the difference between them with the development of instruments. The Encyclopedia Britannica mentioned this in the following text: Most authorities would agree that a vowel is a sound that is produced without any major constrictions in the vocal tract, so that there is a relatively free passage for the air. The encyclopedia indicates that vowels do not undergo major constriction, which is something shared between Arabic and English in the mechanism of vowel production, such as a, i, o. Al-Mar'ashi emphasizes this when he gives us another reminder that consonants can be interrupted at their point of articulation by interruption, unlike vowels, which are projected without effort.

4.4 Details of the points of articulation of the letters nūn and ra:'

Nūn and ra' are alveolar sounds that are produced jointly by the tip of the tongue, which is the tip, and the gums at the bases of the upper incisors. (Ahmad mokhtar omar, 1997, 317).

I have not found in the international phonetic dictionaries available to me a clear explanation and comparison of the position of the tongue when producing the two linguistic sounds, despite their shared interception area. In ancient and modern Arabic phonetic studies, there is disagreement about whether these two sounds are united in their point of articulation or not. However, al-Mar'ashi explained to us in detail the mechanism of producing each sound. The intercepted part of the tongue when producing the nūn sound is its head, and the intercepted part in the lām is the tip of the tongue with its back near its head. This is a detail I have not found anyone mentioning. Ghanim Qadduri

al-Hamad also stated this explicitly, saying: "I have not found anyone who preceded al-Mar'ashi in such detail in determining the points of articulation of the rā'." and the letter "nun".

4.5 The effect of the vocal cords:

Arabic sounds are characterized by various characteristics, including whether they are voiced or voiceless. The voiceless sounds, which are unanimously considered voiceless, are ten: /fa/, /ha/, /tha/, /ha'/, /shin/, /kha/, /sad/, /sin/, /qaf/, and /ta/(/ت/، /ك/، /س/، /ص/، /ش/ ، /خ/ ، /ح/ ، /ث/ ، /ه/ ، /ف/) .

All other Arabic sounds are voiced. Voiceless is a state of stillness of the vocal cords in the larynx when air rushes in due to their opening, while voiced sounds result from the vibration of the vocal cords. The phoneticians who preceded al-Mar'ashi differed in defining the concept of voiced and unvoiced speech due to their inability to determine the reason for voiced and unvoiced speech. The school of phonetics from the beginning of the linguistic sciences among the Arabs until the time of al-Mar'ashi was the school of taste and self-observation. (al-Mar'ashi, 2008, 12). Al-Mar'ashi tried to search for the essential difference between the two phonetic groups by representing the sounds /dh/ and /th/.

5. Subtle Phonetic Issues in Al-Mar'ashi's "Juhd al-muqil:"

In this section of the research paper, we will present a number of contributions to phonetics based on Al-Mar'ashi's book "Juhd al-muqil." We will focus on those that are novel and innovative, or those that demonstrate the strength of scientific grounding compared to those that preceded them.

5.1 Terminological Boundaries between the Sciences of Tajweed and Recitation:

Al-Mar'ashi emphasized the need to clarify the semantic boundaries between the science of Tajweed and the science of recitation, despite their close connection. This is because the science of Tajweed cannot exist without the presence of the science of recitation, given that the subject of the science of Tajweed is the Qur'anic text in its vocal performance. This science cannot exist without its established corpus—I mean the Holy Qur'an through the regulation of the Qur'anic recitations. Al-Mar'ashi also realized the need to clarify the concept of the science of Tajweed at the beginning of the book, immediately after the introduction. To clarify for the reader what phonetic issues he will mention related to the science of Tajweed and what he will leave out due to its connection to the science of recitation, he says: "If you ask: What is the difference between the sciences of Tajweed and Qira'at? I say: The science of Qira'at is a science in which the differences of the imams of different regions in the arrangement of the Qur'an are known, whether in the letters themselves or in their characteristics. If something about the nature of the characteristics of the letters is mentioned in it, then it is a completion, since the purpose is not related to it. As for the science of Tajweed, its purpose is to know the nature of the characteristics of the letters. If something about the differences of the imams is mentioned in it, then it is a completion." Thus, Al-Mar'ashi systematically and scientifically establishes the phonetic issues he will study, or what can be expressed in the language of science as defining the concept and subject of this science.

5.2 The Concept of Sound and Air:

Al-Mar'ashi mentions the views of his predecessors, such as Sibawayh, Mulla Ali al-Qari, and Ahmad ibn Muhammad ibn al-Jazari, in his definition of sound, breath, and the relationship between them. He then provides a summary of his precise understanding of the concept of sound and the mechanism of its production. He states that sound is audible air. This indicates that air never becomes sound before passing through the larynx, and that the origin of sound is air. This phonetic analysis is completely consistent with the definitions indicated by international dictionaries. The Encyclopedia Britannica, in its most recent edition, defines the term "phonetics" as the beginning of sound production through the passage of air from the lungs. A Dictionary of Phonetics and Phonology also defines the consonant and confirms the above, stating:

consonant /lkDns˜n˜nt/ n. 1. (also contoid) In phonetics, a segment whose articulation involves a significant obstruction to air flow in the vocal tract. We should not overlook the fact that Al-Mar'ashi refers to the issue of the vocal cords vibrating and not vibrating when air passes over the larynx. He calls the air that vibrates the vocal cords "audible breath," while the air that does not vibrate with them is called air.

5.3 Consonants and Vowels:

Al-Mar'ashi stated that consonants are essentially formed by stress and interruption, whether that interruption is weak or strong, as he says: "All letters, except for the long alif, share the same basic reliance on the point of articulation, but vary in the strength of that reliance." Immediately following this text, he compares consonants and vowels, clearly defining the difference between consonants and vowels, stating that the air rushing in clearly interrupts the sound, while the interruption is much less or nonexistent in vowels. Therefore, he excluded the long alif in the previous definition. Because it is an extended sound without interruption, there is no difference between what Al-Mar'ashi mentioned and what we find in our time in terms of an analysis of the difference between them with the development of instruments. The Encyclopedia Britannica mentioned this in the following text: Most authorities would agree that a vowel is a sound that is produced without any major constrictions in the vocal tract, so that there is a relatively free passage for the air. The encyclopedia indicates that vowels do not undergo major constriction, which is something shared between Arabic and English in the mechanism of vowel production, such as a, i, o. Al-Mar'ashi emphasizes this when he gives us another reminder that consonants can be interrupted at their point of articulation by interruption, unlike vowels, which are projected without effort.

5.4 Details of the points of articulation of the letters nūn and ra:'

Nūn and ra' are alveolar sounds that are produced jointly by the tip of the tongue, which is the tip, and the gums at the bases of the upper incisors. I have not found in the international phonetic dictionaries available to me a clear explanation and comparison of the position of the tongue when producing the two linguistic sounds, despite their shared interception area. In ancient and modern Arabic phonetic studies, there is disagreement about whether these two sounds are united in their point of articulation or not. However, al-Mar'ashi explained to us in detail the mechanism of producing each sound. The intercepted part of the tongue when producing the nūn sound is its head, and the intercepted part in the lām is the tip of the tongue with its back near its head. This is a detail I have not found anyone mentioning. Ghanim Qadduri al-Hamad also stated this explicitly, saying: "I have not found anyone who preceded al-Mar'ashi in such detail in determining the points of articulation of the rā'." and the letter "nun".

5.5 The Effect of the Vocal Cords:

Arabic sounds are characterized by various characteristics, including whether they are voiced or voiceless. The ten voiceless sounds that are unanimously considered voiceless are: /f/, /h/, /th/, /h/, /sh/, /kh/, /s/, /s/, /k/, and /t/. All other Arabic sounds are voiced. Voiceless is a state of stillness of the vocal cords in the larynx when air rushes in due to their opening, while voiced sounds result from the vibration of the cords. Phoneticians who preceded al-Mar'ashi differed in defining the concept of voiced and unvoiced speech, due to their inability to determine the cause of voiced and unvoiced speech. The approach of phoneticians from the beginning of linguistics among the Arabs until al-Mar'ashi's time was based on taste and subjective observation. Al-Mar'ashi attempted to explore the essential difference between the two phonetic groups by illustrating the sounds /dh/ and /th/, saying: "... If you say 'idh' with a voiced consonant and extend it, you will find its entire breath conditioned by a voiced sound. If you say 'as' with a silent consonant and extend it, you will find the beginning of its breath conditioned by a voiced sound, and its end devoid of that voiced sound, but rather conditioned by a silent sound. And so on." Elsewhere, he calls voiced speech the audible breath, and unvoiced speech the air. Air flows less when pronouncing voiced sounds than when pronouncing unvoiced sounds, while unvoiced sounds are accompanied by a flow. Large, and this is a fact proven by phonetic science in the modern era. This scientific fact is consistent with Al-Mar'ashi's precise observation about the scarcity of air in voiced sounds and its intense rush in unvoiced sounds. (Ladefoged, P., & Johnson, K, 2010, 02).

5.6 The Attribute of Emphasis:

Emphasis is a phonetic characteristic of seven Arabic linguistic sounds: /kh/, /s/, /d/, /gh/, /t/, /q/, /z/. (/خ/ ، /ص/ ، /ض/ ، /غ/ ، /ط/ ، /ق/ ، /ظ/.)

This group of sounds is called the emphatic sounds, and this characteristic is produced by the elevation (raising) of the tongue toward the upper palate. However, this elevation of the tongue occurs in two forms:

The first form: When producing emphatic sounds, the tongue is elevated until it aligns with the upper palate. This intense elevation necessarily generates another characteristic, which is the characteristic of "occlusion." The tongue is

in an occlusion position when producing four of the seven emphatic sounds, which is what is called in Arabic phonemes are "emphatic letters," which are: /q/, /t/, /b/, /j./

The second form: where the tongue is raised and raised toward the upper palate, but does not close to it. This position of the tongue occurs when producing the three remaining sounds: /g/, /kh/, and /q./

We find that the letters of emphatic pronunciation—like many adjectives—have been mentioned in linguistic books since the beginning of Arabic linguistic studies. Sibawayh mentioned them when discussing "imala," saying: "The letters that prevent imala are these seven: Ṣād, Ḍād, Ṭā', Ḍā', ghin, kaf,and kha'.(الصّاد، والضّاد، والطّاء، والظّاء والغين، والقاف، والخاء) (al-Mar'ashi, 2008, 14)

These letters are prohibited from imala because they are letters that are raised to the upper palate. We find that most of the scholars of tajweed after Sibawayh agree with him in defining isti'la and specifying its Arabic sounds. I have followed their definitions in the books of tajweed scholars that I have, starting with Makki and al-Dani and reaching al-Mar'ashi, and I found their expressions to be almost identical. They explain the characteristic of isti'la by the elevation and ascent of the tongue to the upper palate with the seven letters: Ṣād, Ḍād, Ṭā', Ḍā', Ḍā', Ḍā', Ḍā', Ḍā', and Ḍā'. However, although Al-Mar'ashi agreed with his predecessors in their description of the mechanism of isti'la', he went further in clarifying it and elaborated on the position of the tongue in precise detail. What is meant by isti'la' is not the entire tongue, but rather its back part, or what the scholars of Tajweed call "the back of the tongue. (al-Mar'ashi, 2008, 151-152)

" Al-Mar'ashi explained the difference between the isti'la' and others that are produced by raising the tongue, such as the letters in the middle of the tongue /j/ and /sh/, saying: "What became clear to the poor person after much contemplation of Al-Jarbardi's words is that what is considered in isti'la' in their terminology is the elevation of the back of the tongue, whether the rest of the tongue is elevated with it or not. The letters in the middle of the tongue, which are the jim, the shin, and the ya', are only elevated in the middle of the tongue, and the kaf is only elevated between the back of the tongue and its middle. Therefore, these four are not considered as isti'la', even if the tongue is elevated, because its elevation in these four is not like its elevation with the isti'la' letter." The maximum degree of emphasis is consonant consonant, as we mentioned. Therefore, every consonant that is consonant is consonant, but the opposite is not true. It should be noted that modern phoneticians call the three sounds: /q/, /kh/, and /g/ "consonantal" (tabak) in reference to the palate, which is the soft palate toward which the tongue ascends. Al-Mar'ashi's detailed explanation of the part of the tongue that ascends is supported by modern phonetic studies and described by phoneticians. Technical studies have proven that the root of the tongue (which al-Mar'ashi calls the "extreme part of the tongue") is the one involved in emphasis. The Encyclopedia Britannica mentioned this in its Arabic Phonetic System update dated 03/06/2025.

5.7 Emphasis:

Emphasis is a vocal characteristic that is considered an auditory effect resulting from emphasis. Al-Mar'ashi defines it as: "A fatness that enters the body of the letter, filling the mouth with its resonance." By "the mouth is filled with its resonance," he means that emphasis fills the resonance chamber. It is formed when the back of the tongue is raised, the passageway is narrowed, and the movement and shape of the articulatory organs involved in sound production are interfered with. This confirms Al-Mar'ashi's understanding through his definition of this auditory phenomenon as being linked to phonetic performance, unlike many modern scholars who have confused the two concepts.

Such as Cantino, who considers emphasis and closure to be one and the same, stating: "It is not possible to differentiate emphasis from closure and superiority." Samir Sharif Istitieh objected to this confusion among some modern scholars, saying: "It may be a common assumption among phonetics students that emphasis and closure are two terms that refer to the same meaning. This is an assumption whose prevalence does not prove its validity." To complete Hassan's precise description, he must mention it, where he says: "Exaggeration is, therefore, a phonetic phenomenon resulting from organic movements that alter the shape of the resonating chambers to the extent that it gives the sound this emphasized vocal value." The reason for this emphasis can be summarized by mentioning the most important articulatory positions assumed by the articulatory organs:

-The movement of the tongue root backward toward the palatal wall.

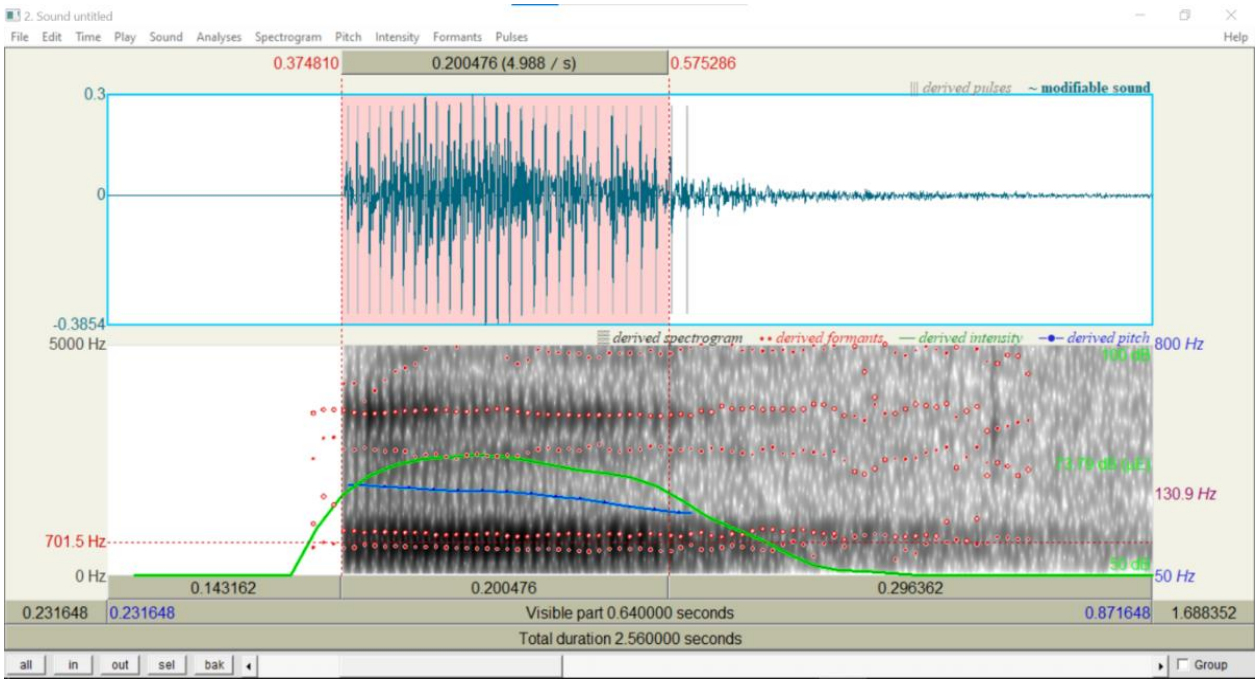
-The occurrence of a narrowing resulting from the retraction of the tongue root.

-Changes in the shape of the tongue.

All of this creates an oral resonance chamber, a precise description mentioned by Al-Mar'ashi in his previous statement, "The mouth is filled with its echo".

5.8 Degrees of Emphasis:

In this part of the study, we will analyze a sample of audio recordings I previously made using PRAAT, a free computer program designed by Dutch scientists David Weeninck and Paul Boersma at the Institute of Phonetics at the University of Amsterdam. It analyzes sound waves and spectrally analyzes the sound, allowing for the analysis of its acoustic properties, such as voiced or whispered, and friable or explosive sounds. It provides values for the sound waves in terms of amplitude, length, frequency, and other parameters. It also displays the values of the various acoustic parameters (resonant frequencies) that we rely on to analyze the emphatic quality. Here is a sample of a spectral image of a linguistic sound:



The red dots indicate the five vocal folds, and the solid blue line represents the voice pitch (vibration of the vocal cords). The spectral image shows the vertical blue lines that represent the vibrational image of the sound. The vocal part selected for analysis is colored pink, with its articulation time in seconds and fractions of a second. For example, the attached image has a part with a time length of 0.200476 seconds. To analyze the degrees of emphasis, the values of the second vowel F2 for the sound under study are relied upon, because F2 represents the resonant chamber associated with the back of the tongue. Its value decreases with its height and increases with its lowering and the forward movement of its tip. Accordingly, the lower the values, the more luxurious the sound, and the higher they are; The sound was less emphasized or thin, and the following table gives us a representation of the value of F2 when pronouncing the letter seen with a fatha vowel versus the letter sad with a fatha vowel, and the same is the case with the letter dhal versus the letter dhal. We chose these sounds because the distinguishing phonetic feature between each sound and its counterpart is emphasis.

Table No. (01): Table of audio F2 values

/dha/ـَـ/ + /	/dhal/ـَـ/ + /	/sad/ـَـ/ + /	/sin/ـَـ/ + /

1220.1610Hz	1703.0585Hz	1436.7967Hz	1845.0053Hz

We clearly notice that the value of F2 increases with the softened sound /sin/ and decreases with its emphatic counterpart /sad/, and the same is true with /dhal/ and /dha/.

In light of what was previously stated and by referring to Al-Mar'ashi in his analysis of the phenomenon of emphasis, we see him making a comparison between the degrees of emphasis in the emphatic sounds, dividing them into two groups: the group of emphatic sounds and the group of non-emphatic sounds, taking into account the position of the tongue and the organs of speech when producing these sounds. This in itself is evidence of understanding the phonetic behavior, unlike most of those who preceded him, where they make a comparison in a single sound in all its structural states with the vowels. Al-Mar'ashi says in the comparison: "The emphatic letters are more expressive than the rest of the emphatic letters... In short: the degree of emphasis is according to the degree of emphaticity and emphaticity. The silent ta' is the most emphatic of the letters, and since the qaf is more expressive in emphaticity than the voiced ghayn and kha', as you know, it is more emphatic than them." He also says: "...and since the silent ta' is stronger in emphaticity than its sisters; Its emphasis was greater than that of its sisters, as in "Al-Ri'ayah" and "Al-Tamhid." I say: Since "Ṣād" and "Ḍād" are medium in emphasis, as you know, they were also medium in emphasis. And since "Ḍā" is the weakest of the emphatic letters in emphatic articulation, its emphasis was less than that of its sisters. The gist of the matter, according to him, is that the order of the degrees of emphasis in the group of emphatic sounds is: /ṭa/, /ṣad/, /ḍhad/, /dha/. (./ظ/، /ض/، /ص/، /ط/)

He emphasizes that the letter ta' is more emphasized and the letter dhā' less emphasized, with the letters Ṣād and Ḍād between them, without indicating their order.

The order of the degrees of emphasis in the group of non-emphatic, emphatic sounds is/:qaf/, /gḥayn/, /kha./(، /ق/ ./خ/ ، /غ/)

He emphasizes that the letter qaf has the highest emphasis, while the letters ghayn and kha' have the lowest. By referring to the PRAAT program and analyzing the recordings I made previously, we find the following:

Table No. (02): Table of the values of the sound points F1 and F2 for the applied high sounds

second value (F2)	**First value (F1)**	**The silent, lofty one + the short, voweled one**
هرتز 1201.91267Hz	هرتز 582.14830Hz	/ta/ó / + /
هرتز 1449.95674Hz	هرتز 1201.91267Hz	/sad/ó / + /
هرتز 1414.62875Hz	هرتز 505.67686Hz	/dhad/ó / + /
هرتز 1505.37340Hz	هرتز 602.65136Hz	/dha/ó / + /

The table shows the total values for the first and second diacritics. We will focus more on the second diacritical mark, as it is more closely associated with emphasis than the first. What the recording analyses revealed is that the sounds characterized by emphatic diacritics differ in their degrees of emphasis, and that they fully agree with Al-Mar'ashi's analysis, despite its reliance on subjective observation and a sense of taste. The following table shows the values of the diacritical marks for the non-emphatic emphatic sounds:

Table No. (03): Table of the values of the F1 and F2 pitches for the unvoiced, high sounds

Second value (F2)	First value (F1)	The silent, exalted, non-applied consonant + the short vowel
854.9911Hz	561.2018Hz	/qaf/ó / + /
945.5272Hz	553.4845Hz	/kha/ó / + /
971.8825Hz	574.9502Hz	/ghayn/ó / + /

PRAAT analyses of the un-emphasized emphatic sounds show complete agreement with al-Mar'ashi's views on their degrees of emphaticity. We found that the qaf is the most emphatic of them, as it is given the lowest value of F2 compared to the other two sounds.

5.9 Warning against nasalization during prolongation:

In the Arabic phonetic system, nasalization is the sound produced as a result of air rushing from the nasal cavity. It is a characteristic of the sounds /mim/ and /nun/, which is why phoneticians call them nasal sounds. We find Al-Mar'ashi warning against nasalization with the three long vowels, saying: "...and that is why some people pronounce the prolongation accompanied by nasalization in words like 'we seek help' without realizing it. This is a mistake. The way to know if it occurs in such a situation is to pronounce it once while holding your nose and once without. If the prolongation sound differs in the two cases, know that it is accompanied by nasalization." This warning was well-known and well-known before Al-Mar'ashi. However, I did not find anyone who explained the method of knowing this warned vocal performance in singing long vowels in the sources that I read to which Al-Mar'ashi referred. Thus, Al-Mar'ashi shows us the strength of his vocal thought and his deep understanding of the mechanisms of producing Arabic sounds. (al-Mar'ashi, 2008, 311)

6. Conclusion:

In conclusion, the study aimed to highlight the various contributions of scholars of Islamic civilization from outside the Arab region to the study of Arabic at the phonetic level. It focused on the Anatolian region, as it is the region closest to the Arabian Peninsula geographically and the most scientifically dynamic throughout the history of Arab-Islamic civilization. It was also the capital of the Islamic Caliphate. The research paper uses Muhammad ibn Abi Bakr al-Mar'ashi as a model for this significant contribution to Arabic phonetics. The study demonstrated the extent of novelty and innovation that characterized his studies in his book "Juhd al-muqil." We listed a number of results that emerged from this paper, the most prominent of which are:

-Al-Mar'ashi was able to define the boundaries and features of the science of Tajweed and separate them from the features of the science of reading.

-Al-Mar'ashi defined the mechanism of linguistic sound production and clarified, more than his predecessors, the reality of voiced and unvoiced pronunciation. - With his profound ability to understand the position of the articulatory organs, Al-Mar'ashi was able to differentiate between the mechanism of producing the sounds of Ra and Nun. No one else, as far as we know, preceded him in identifying the part of the tongue involved in producing these two sounds.

-Al-Mar'ashi is considered the most prominent figure to distinguish the elevated part of the tongue from the elevated sounds. Most of his predecessors considered elevation to be an ascension of the tongue without further elaboration.

-Al-Mar'ashi understood the reality of emphasis and explained its degrees with great precision. He arranged the sounds according to emphasis and was very successful in dividing the elevated sounds into mutaqabbed and non-mutaqabbed sounds, and the technical analytical results were consistent with his position.

- Al-Mar'ashi explained the method for determining whether a sound is nasalized, and he provided a practical method for doing so, demonstrating his scientific understanding of the positions of the articulatory organs.

Acknowledgment

The author wishes to thank Ali Lounici University of Blida 2, Algeria, for the academic support and resources that facilitated the preparation of this research. Special appreciation is also extended to colleagues in the Department of Arabic Language and Literature for their valuable insights and encouragement during the course of this study.

Conflict of Interest

The author declares that there is no conflict of interest regarding the research, authorship, or publication of this article.

Keywords Social Media, Facebook, Socialization, adolescent, Secondary Stage.

Abstract

This study aimed at identifying the reality of secondary-level adolescents' use of social media and as a Facebook model First, by revealing the educational, social and psychological effects of these media on an individual's psyche, Second, determine the impact of social media on the upbringing of individuals in society and to highlight the role of both the family and the school in guiding teachers towards the rational and safe use of these technological media. The study relied on the analytical descriptive curriculum as an appropriate approach to research objectives. The study tools were the questionnaire to collect data, which was applied to a sample of 85 pupils selected in a deliberate manner by Facebook users at Lycee Chaheed Benawla miloud Elguettar.

The study came up with a series of findings, most notably: Facebook is the most important and widely used means for secondary adolescents to meet different educational, educational, recreational,... The study also showed differing effects on the use of Facebook among secondary pupils.

The study came up with a series of proposals: for example, the active role of family and school in accompanying children from technological media users more effectively, to reduce their negative effects.

Introduction:

In the past few years, the world has witnessed a technological boom unprecedented in the entire history of humanity, which has greatly affected individuals as well as societies. The world has become a small village. Modern technologies have contributed to bringing distances closer and shortening time and effort.

Perhaps one of the most important technological aspects of these is social networking sites, which have brought about a qualitative revolution in communication processes and have been imposed on all of humanity, regardless of their types and classes, to convey their ideas and opinions through social interaction between individuals using various technologies and modern means of communication. Gradually, social networking sites, including Facebook, have become an essential part of individuals' lives, and have imposed themselves in all areas of daily life, whether for multiple educational, pedagogical, recreational, cultural, or social uses...

Facebook is considered the most prominent communication network that has been very popular with a large segment of society, including learners in various educational levels, as this medium has become a tool for socializing individuals, due to its daily use, so teenagers who practice their high school education in direct coexistence with it now own pages. Their own, which has resulted in several positive and negative effects in all fields: educational, social, psychological and health Through the daily experience of students as a researcher and school guidance advisor in high school, and according to the exploratory study he conducted, this proposition is confirmed.

If we look at the phenomenon of using Facebook as a modern means of socialization and its effects on individuals, especially when it comes to adolescents (an important group of society) who are distinguished by a set of specific cultural, social, psychological and physiological characteristics that differ from other social groups, especially it must be examined with some explanation and analysis.

Based on the above, this current study attempts to answer the following question:

What are the effects of using Facebook on a teenager's upbringing methods in secondary education?

To answer this main question, sub-questions emerged, which are as follows:

1- What is the reality of teenagers using the social networking site Facebook in Algeria?

2- What are the educational, social and psychological effects of a teenager's use of Facebook?

The importance of the study:

The importance of the current study is highlighted in its treatment of a phenomenon of the modern era that is constantly changing and developing day after day, which is social media - Facebook as an example - and the effects it has and the great effects it has on an important segment of society –adolescents.

The impact of social media on the building of individuals and the formation of their personality, especially with regard to the most targeted group in Algerian society, which is adolescents.

Enriching the research and scientific aspect with a study on adolescents and their impact on these applications.

Study objectives:

To identify the impact of the use of social media (Facebook) in the upbringing of schooled adolescents in secondary school.

To identify the reality of the use of Facebook by adolescents.

Knowing the motives for teenagers - the group of students among them - using social media, especially Facebook.

Revealing the educational, social and psychological effects of a teenager's use of Facebook.

Procedural concepts of the study:

Impact: In the current study, impact means the changes that Facebook brings about in behavior and attitudes, whether positive or negative, on adolescents from the psychological, social, and educational aspects.

- Facebook: One of the applications available on mobile devices or computers, which is used by teenagers studying in secondary school for various purposes.

Socialization: It is a set of values, customs, traditions and trends that are instilled in the child from childhood to the teenage years by social institutions and modern means of communication.

- Adolescents: In the current study, we mean individuals who study in the secondary education stage, and whose ages range between 15-20 years.This study was applied to them of both sexes, males/females, from Al-Shaheed Ben awla Miloud El-Quettar High School.

Previous studies:

1- Al-Khashmi et al.'s study (2023): This aimed to identify the motives for Saudi youth's use of social media networks, and the effects resulting from their use, as the study relied on a social survey, and the study tool was represented in the interview and questionnaire, on two samples, the first a simple random sample of university students (4270 students).), and the second is an intentional sample from the category of young people who do not belong to the university The study concluded that among the positive effects of media exploitation are the diversity of sources of obtaining information, increasing awareness of areas of life, helping to solve some problems, and acquiring new skills.

2- Bin Sheikh's study, Ghawafriya (2021): entitled "The Role of Modern Media of Communication in Socialization," which aimed to identify the role of modern media in socialization.The study found that all modern social media contribute in one way or another to socialization processes, In addition to traditional upbringing institutions, the family, school, and mosques, the socialization process is an integrated, communicative process that requires concerted efforts and cooperation for the sound upbringing of individuals.

3- Al-Fariji Study (2018): Titled "Children and adolescents' use of social networking sites and its impact on their family relationships - an exploratory study.This study aimed to identify the sites most used by children and adolescents, and the negative effects of that.The researcher relied on an intentional sample of 650 children and adolescents from Saudi society use social media on a daily basis, and the study tool was the questionnaire and the observation tool The study found that the majority of daily media users are from stable families and are inside the home, and this is done via mobile phone, and it has positives as well as negatives.

4- Sabti Study (2024): Tagged with "Facebook addiction and its psychological and social effects on adolescents - a field study on a sample of Facebook users (Algerian adolescents as an example)." This study aimed to reveal the psychological and social effects that an excessive or addicted person to social networking sites may have.Specifically, Facebook on adolescents in Algeria, where the researcher relied on the descriptive and analytical approach The Facebook addiction scale and the mental health scale were used, prepared by the researcher.The research sample consisted of 150 teenage Facebook users who were chosen intentionally.The study concluded that addiction to Facebook has psychological effects such as anxiety and stress and social effects such as social withdrawal and isolation.

5- Al-Hashemi et al.'s study (2020): Its title is "The Impact of the Use of Social Media on Child Upbringing in Omani Society," a study submitted by the Omani Social Society to the Ministry of Social Development, in order to identify the reality of the Omani child's use of social media, and reveal its educational and social effects.Psychological and health...The descriptive analytical approach was also adopted, and the study tools were represented in a questionnaire and applied to government school students in three governorates of Omani society Their number reached 2,246 students, and the interview evidence included a sample of social and psychological workers in schools and parents of students involved in the study. The study reached a set of important results, most notably: The educational effects of social media came strongly and first, followed by the social and psychological effects, then the health effects, with difficulties and challenges among specialists and parents in controlling children's use of these means of communication.

The researchers benefited from these local and Arab studies that contributed to studying this phenomenon at the individual and societal levels, as they helped us a lot in crystallizing the research idea, identifying the problem, and setting questions, and also in the methodological framework in choosing the appropriate method, and choosing the field study sample, while designing the study tool.And benefit greatly from its results.

Some observations can also be drawn from these previous studies, which the researcher summarized as follows:

The previous studies they relied on focused on studying the reality and how adolescents use social networking sites in general, especially during adolescence and the psychological, psychological and emotional

characteristics that characterize it...It pushes them to go to the virtual world through these sites, to prove themselves and express what is on their minds and minds.

Previous studies have shown the magnitude of the effects resulting from excessive use of Facebook in particular, and the family's responsibility as an essential party in the socialization of its children.

The current study is distinguished from previous studies in the researcher's attempt to study the impact of technological media in the form of Facebook on the upbringing of teenagers studying at the secondary level from all psychological, educational and social aspects, given that this is the important segment of society that most uses these technological means for various purposes.

The current study also agreed a lot with my current study in its aspect of educational and social effects, and differed from it in terms of psychological and health effects

Use of social media (Facebook) in Algerian society:

Social networking sites as a whole have brought about many changes in lifestyle, whether at the level of individuals or societies.Perhaps Facebook is one of these media that has made a difference, and has become an integral part in the daily life aspects of individuals.We cannot abandon it, especially with regard to the adolescent group, which constitutes The largest part in dealing with various modern techniques and technologies as a result of its peculiarities and way of life Algeria is one of the countries that most uses social media platforms, including Facebook, according to statistics from the annual digital report globally and for Arab countries for the year 2023.

Facebook has contributed to shaping new trends for teenage users in all countries of the world, especially Algeria in particular, as the international consulting agency "Data Reportal" published in its annual report on the Internet and social networks for the year 2023, where the number of Facebook users in Algeria reached about 20.80 million people, which is Equivalent to 75% of the total population of Algeria who are 18 years of age or older (Al-Shorouk website statistics 2023) Facebook is the most accepted and responsive network among segments of society, including young people on the one hand, and the largest social network on the Internet, according to several different studies (Omani Social Society, 2020, p.54).

In the same context, and according to a recent study by Talbi and Rwaq (2023), Facebook is one of the most used sites by students in the secondary stage, and it meets their personal needs and interests, due to its ease of use and its advantage with a set of features and services that allow them to interact, participate, and exchange ideas (Talbi and Rwaq, 2023, p.99).

Field study:

Study Methodology: To achieve the objectives of our study, the descriptive and analytical method was used to identify the reality of secondary school adolescents' use of social media, such as the Facebook model, by revealing the educational, social, and psychological effects that these media have on the individual's psyche

Limitations of the study: The field research for this study was conducted at Al-Shaheed Ben Aoula Miloud El-Quettar High School, Relizane Province, in the second half of the 2023-2024 academic year.

Study sample: The study sample consisted of 85 male and female students in the secondary stage, who were intentionally selected from Facebook users, including 52 female students and 33 male students distributed across the three levels.

Justifications for choosing the field study sample: The adolescent segment is considered the weakest link among members of society, and it constitutes the largest percentage in existence.This age group is the basis for the establishment of societies in the future, and is characterized by specific psychological, physiological, physical and social characteristics... Individually from the rest of the groups, and the social structure as a whole is affected by it, and due to the importance of this segment in society and the external factors and changes that are affected by it, including these technological applications that have invaded homes, and given this group's exact

dependence on Facebook in particular, this instructed us to present a study on the impact of this application.On various educational, psychological and social aspects of a teenager's life.

Study instrument: The questionnaire instrument was applied to the members of the sample selected from high school students, as it consisted of four basic axes and 26 directed/semi-directed questions.

Theme 1: Personal data of the respondents.

Theme 2: The impact of the educational dimension resulting from the use of social media.

Theme 2: The impact of the social dimension resulting from the use of social media.

The second axis: The impact of the psychological and health dimension resulting from the use of social media.

- Statistical processing: The researcher used the statistical program SPSS version 20, and in order to read the results statistically, the statistical processing method used to analyze the results included the following:

1- Summarize the collected data in simple frequency and percentage tables.

Data processing and analysis:

Table No.01. Distribution of the study sample by gender

Gender	Frequency	Percentage
Male	33	38.82%
Female	52	61.17%
Total	85	100%

Table (01) represents the characteristics of the sample by gender, as it becomes clear to us that the highest percentage recorded is due to females at 61.17%, compared to males at 38.82%, and this is completely consistent with the current data on the number of students in Al-Shaheed Ben awla Miloud El-Quettar High School, Relizane Province, which It reached about 541 students in February of the 2023-2024 academic year, including 304 female students, or 56.19% It constitutes the total number of students, and 237 students, or 43.80% (according to the list of students attending at the end of January 2024), and here we notice a sweep of females among the students, and this is due to several reasons, including the increase in female births over males in recent years, and to the positive view of parents towards educating females who They now have many chances of academic and even professional success.

Table No.02: Status of the study sample's use of Facebook by gender variable.

Gender	Total (N)	Rarely	Sometimes	Always	% Rarely	% Sometimes	% Always	% Total
Female	53	6	16	31	11.32%	30.18%	58.49%	100%
Male	33	2	6	25	6.06%	18.18%	75.75%	100%
Total	86	8	22	56	9.30%	25.58%	65.11%	100%

Through the statistical reading of Table 02, it becomes clear to us that the majority of browsers of the Facebook application of both genders are permanently male/female, at a rate of 65.11%, distributed at a rate of 58.49% for females and a rate of 75.75% for males, in contrast to us finding that a rate of 25.58% for both sexes visit the Facebook site sometimes, ranging from 30.18% for females, and 18.18% for males, and in the end we record a small percentage estimated at 9.30% of males and females who browse Facebook rarely, distributed as follows: 11.32% for females, and 6.06% for males.

Therefore, the largest percentage of teenagers studying in the educational institution under study use Facebook permanently on a daily basis, and this permanent and increasing use of the Facebook site in this way by students in the secondary stage may justify the site's availability of characteristics and a set of features that reflect the virtual life of the teenager in This age, considering that this application is the most widespread and widely used among young people, according to the study of Talbi and Riwaq (2023) Considering that Facebook is the preferred destination for its users in this category of this exact educational stage, they share it for various purposes, whether educational, cultural, entertainment, or social...According to the opinions of the respondents.

Our study was in complete agreement with Al-Fariji's (2018) study, which concluded that the majority of media users are on a daily basis and have positives as well as negatives.

Table No.03: Shows the distribution of the study sample according to hours of Facebook use.

Usage Duration	Frequency	Percentage
One hour per day	7	8.24%
Less than two hours	12	14.12%
Two to three hours	41	48.24%
Four hours or more daily	25	29.41%

It is clear from Table (03) that the majority of teenagers studying in the secondary stage spend from 2 hours to 3 hours browsing Facebook sites, reaching 48.24%, followed by those browsing Facebook for a period exceeding 4 hours a day, at a rate of 29.41%, and 14.12% spend less than two hours using the network.Less than those who browse Facebook programs for a period of time less than one hour Perhaps the long period of browsing this site indicates several indicators of the existence of a virtual world that is an alternative for teenagers to their real world, given that this stage is crucial in the lives of individuals and is characterized by a set of physiological, physical, emotional and psychological variables.This application also saves them the trouble of searching and navigating the corridors of libraries, and investigating About information, especially when they are taking semester and official exams, as well as involving it in completing their school work and research This is what we will show in Tables 04-05

The number of hours of use of the Facebook network among teenagers is due to personal priorities, social circumstances, and psychological needs as well.According to a study by Barara and Awfi (2022), it is considered that teenagers find great pleasure in browsing social networking sites, because this network includes sites for entertainment, education, and games as well.And others, which make him feel fun, knowledgeable, and satisfy curiosity (p.161) According to Bouqlouf's study (2018), Facebook is considered the most appropriate haven

that provides its users with a virtual life characterized by fun, seriousness, amusement, entertainment, etc.to benefit from its features and services (Bouqlouf, 2018, p.258).

Table 04: Educational Effects of Facebook Use Among the Study Sample

Items	Agree	%	Neutral	%	Disagree	%	Mean	Std. Deviation	Level
To do homework and conduct research	63	74.1%	10	11.8%	12	14.1%	2.32	0.72	High
For learning and acquiring knowledge	59	69.4%	14	16.5%	12	14.1%	1.65	0.73	High
Self-education and building knowledge base	41	48.2%	5	5.9%	39	45.9%	1.98	0.97	Medium
Discussing lessons with classmates	51	60.0%	13	15.3%	21	24.7%	1.45	0.85	High
Following the latest news	19	22.4%	20	23.5%	46	54.1%	1.40	0.82	Low

It is clear from Table No.04 that the arithmetic averages of high school students' responses to the educational effects of their use of Facebook ranged between (1.40-2.32), and therefore they came between the high, medium, and low levels. The majority of the educational dimension items were at a high level, and this reflects the positive educational role and effects of Facebook among users of the sample under study.

These results agreed with the results of Al-Khashmi et al.'s (2023) study, which concluded that among the positive effects of media exploitation are the diversity of sources of obtaining information, increasing awareness of areas of life, helping to solve some problems, and acquiring new skills.Darasi also agreed with Al-Hashemi et al.'s (2020) study.Regarding the educational effects of social media, which came strongly and ranked first among other social and psychological effects This clearly shows that Facebook has become the basis of the educational learning process for all students, especially at the secondary level, because it adds to their learning path, in addition to removing many of the intractable obstacles that students faced while reviewing or completing research, as a gain of time and effort.

Other studies also included that among the goals of teenagers' use of social networking sites is to browse news and circulate it among friends, especially sports or artistic ones (Labrara and Awfi, 2022, p.163), contrary to what our current study stated.

The researcher explains these results, which relate to the educational effects, to the urgent necessity and strategies that the teenager studying in the secondary stage has begun to use to possess a stock of knowledge and acquire new skills that he exploits in various programmed exams and different situations...Even families have begun to encourage such new mechanisms in their perception of success and academic excellence for their children.No home is devoid of these modern technologies and technologies that facilitate the learning process if they are used properly Several educational platforms have also been established by the Ministry of National Education and by teachers to improve the learning process, facilitate communication between the professor and the learner, and create a digital educational space that helps students access it to review and acquire educational skills and competencies.

Table 05: Social Effects Among the Study Sample Resulting from Facebook Use

Items	Agree	%	Neutral	%	Disagree	%	Mean	Std. Deviation	Level

Making friendships and relationships with others	56	65.9%	11	12.9%	18	21.2%	1.98	0.82	High
Avoiding isolation and withdrawal	53	62.4%	13	15.3%	19	22.4%	1.92	0.83	High
Sharing with family members during religious/national events	39	45.9%	9	10.6%	37	43.5%	1.60	0.95	Medium
Changing daily routine and filling free time	43	50.6%	6	7.1%	36	42.4%	1.55	0.96	Medium
Entertainment and fun with friends	57	67.1%	5	5.9%	23	27.1%	1.86	0.88	

It is clear from Table No.05 that the arithmetic averages of high school students' responses to the social effects of their use of Facebook ranged between (1.98-1.55), and therefore they came between the high and average levels, and the paragraphs that stated "Forming friendships and relationships with others," "Avoid isolation and introversion," and "Entertainment and entertainment with friends" ranked first at a high level.

Referring to the results of this part of the study, which were very consistent with what was confirmed by Maatouq's study (2018), that Facebook contributed greatly to the emergence of virtual friendship relationships, and they extended widely at the expense of real relationships, in an effort to expand the circle of friends, and Facebook did not cause The teenager is isolated or introverted as a result of poor interaction with society (Maatouq, 2018, pp.364-367).

Among the positive things about using Facebook, according to Darbal and Haddad's study (2019), is that it has become a window into the world, expressing opinions, communicating, sharing with friends, and learning about the cultures and traditions of others (Darbal and Haddad, 2019, p.149).

Among the needs most satisfied by secondary school students is entertainment and leisure, and this is what Al-Omari's study (2018) showed, and according to a recent field study by Talbi and Rwaq (2023), the needs of entertainment and leisure are superior to other basic needs.

These technological media, including Facebook, have also contributed greatly to strengthening social relationships and achieving harmony and social cohesion between members of the same family or between friends (Nawadri and Marzqal, 2021, p.103), and this inevitably leads to the teenager satisfying his needs for communication and interaction within his social environment.

Our study differed from the findings of the Sabti study (2024) that addiction to Facebook has social effects such as social withdrawal and isolation.It agreed with other studies that this application contributed significantly to the formation of charity and social relationships, including the study of Al-Khashmi et al.(2023) and the study of Bin Sheikh, Ghawafriya (2021).) and the study of Al-Fariji (2018), and the study of Al-Hashemi et al.(2020).

The researcher attributes these results related to the social dimension, through the Algerian family's ownership of various modern technologies and the exploitation of these digital platforms in their daily interactions and social relationships, and achieving their own satisfactions, as well as the increasing interest of the adolescent group in forming virtual friendships and relationships and expanding them to meet their needs, especially at this age.Which requires more parental monitoring and accompaniment.

Table 06: Psychological and Health Effects Among the Study Sample Resulting from Facebook Use

Items	Agree	%	Neutral	%	Disagree	%	Mean	Std. Deviation	Level
Reducing stress and anxiety	71	83.5%	6	7.1%	8	9.4%	2.29	0.62	High
I suffer from constant pain and headaches	33	38.8%	10	11.8%	42	49.4%	1.26	0.93	Low
Facebook has caused me a decline in eyesight	38	44.7%	7	8.2%	40	47.1%	2.02	0.96	Medium
I feel lethargic and lose appetite when using Facebook	37	43.5%	11	12.9%	37	43.5%	2.00	0.93	Medium
Facebook has caused me neuropsychological disorders (e.g., autism...)	23	27.1%	14	16.5%	48	56.5%	1.10	0.87	Weak

It is clear from Table No.06 that the arithmetic averages of high school students' responses to the health and psychological effects of their use of Facebook also ranged between (2.29-1.10), and therefore they came between the high, medium, low, and weak levels as well, as the paragraph that states "reducing stress and anxiety" ranked First with an arithmetic average (2.29), and the paragraph that states "Facebook caused me neuropsychiatric disorders such as autism" ranked firstIt ranked last and at a weak level with an arithmetic average of (1.10).

These results can be extrapolated to the fact that Facebook has become a means of relieving stress and all forms of stress and anxiety for all social segments, including teenagers, as they are the most important group that uses the Facebook network, and it may cause a seizure Anxiety and stress among another group of adolescents if the rate of daily use increases, and this is what was revealed by several different university studies conducted in several countries (Burney, 2018, p.230)

The latest results were completely different from what Khudair's (2018) study showed, that social networking sites, including Facebook as well, expose teenagers to some neurological diseases such as personality diseases and vanity...As a result of continuous browsing of it (Khudair, 2014, p.411), and this was also confirmed by the study of Koussa and Bin Qasimi (2019) that excessive use of Facebook negatively affects the psychological life of the teenager and causes him insomnia, depression, and addiction (p.28), and through addiction to some Facebook sites that The teenager resorts to it directly to satisfy their desires, fulfill their needs, and satisfy their curiosity as a result of precious social and family frustrations My study differed in its psychological dimension from what Sabti's (2024) study concluded that addiction to Facebook has psychological effects such as anxiety and stress.

As an explanation for the results drawn about the health and psychological effects that Facebook causes in the life of teenagers, they were negative, as specialists in sociology, psychology, and doctors began to criticize the consequences of excessive use of these media, including Facebook, which has become a threat to their health lives, such as blindness, lack of vision, and pain.Neck....And mental illnesses such as autism, introversion, sleep disorders, anxiety, and stress...This confirms the essential role assigned to parents for continuous and accurate follow-up of their children.

Conclusion:

Social networking sites are considered the networks that have provided individuals with the most wide spaces for learning, acculturation, and social interaction.Perhaps Facebook is one of these networks that has spread terribly among young teenagers, especially in school settings.This, due to several social, educational, and

cultural considerations, has naturally brought about a major change in their lives.Personality and their way of living and thinking In our study, we have tried to determine the most important educational, social, psychological, and health effects of Facebook on the upbringing of the teenager studying in the secondary stage.The results obtained showed differences in terms of impact, which in their entirety were primarily in favor of the educational dimension.This is of course because this target group in the study is from Among the students in the educational institution, it has educational and learning needs and interests, as I explained previously As for the social dimension, it is also no less important than the educational dimension, as it is one of the priorities of adolescents in forming virtual relationships and friendships and spending their free time exploiting Facebook, which has become part of their daily lives.As for the health and psychological effects of exploiting Facebook and what it has on the adolescent's health, the study indicated a number of Recommendations we mention include:

The necessity of coordination between the family and the school and the necessity of opening channels of dialogue between them regarding the lives of children, taking care of their concerns and interests, following up on them at home and abroad, and allocating specific times for the use of digital platforms.

Raising awareness and sensitizing to the danger of social networking sites as a whole and Facebook in particular to the health and psychology of adolescents concerns all actors and social partners.

Activating the role of school media to educate learners about the danger of excessive exploitation of Facebook.

Contributions of the Association of Parents and Civil Society Actors to raising awareness and reminding parents and their children of the negatives of social platforms and how to confront them.

Inclusion of a new information material in educational programmes and curricula concerned with the study of the modern interests of adolescents, particularly with regard to those technological sites and how they can be exploited.

Improving the student's academic climate, giving him space to express his interests and concerns, and employing cultural and sports clubs to his advantage to extract his stacks and eliminate free time.

Abstract

This study aims to examine the impact of using information technology (IT) techniques in internal auditing on the quality of financial reporting in a sample of economic entities in Algeria. To achieve this objective, the research adopts a mixed-method approach, combining a questionnaire and semi-structured interviews to ensure a comprehensive analysis. Quantitative data were collected through a survey of 99 employees working in internal audit departments across 30 economic entities, while the qualitative dimension relied on interviews with three internal auditors to capture practical insights. Path analysis using the partial least squares structural equation modeling (PLS-SEM) approach in SmartPLS 4 was employed to test the hypotheses. The findings reveal a significant positive impact of IT use (particularly ERP systems and data analysis tools) on both internal audit effectiveness and the quality of financial reporting. However, the mediating role of internal audit between IT use and financial reporting quality was not supported. Furthermore, the absence of audit committees, limited management support, lack of advanced IT tools, and the failure of boards of directors to fully implement internal audit recommendations weakened the contribution of internal audit in enhancing financial reporting quality. The study recommends strengthening auditors' IT competencies, establishing audit committees, ensuring the execution of audit recommendations, and investing in modern technological tools to reinforce internal audit effectiveness and financial reporting quality.

1. Introduction

Today, the world is witnessing an increasing development in the role played by modern technologies in various aspects of economic and social life at the national level. It is evident that technology in this era is no longer an option but has become a fundamental work strategy that must be integrated into all aspects of the entity in order to achieve progress and growth. It is now widely acknowledged that information technology constitutes a vital and effective tool on which entities, whether public or private, rely to carry out their activities efficiently, while achieving high levels of speed and accuracy in performance.

Information technology has emerged as an advanced field of knowledge aimed at employing computers and modern communication systems in the processes of collecting, processing, storing, and transmitting diverse data, including audio, visual, textual, and digital content. The philosophy of this field focuses on the optimal use of advanced devices and techniques to transform raw data into strategic insights and documented evidence that enable administrative leaders to formulate sound and effective decisions (Salehi & Husini, 2011). Its development is constantly changing and advancing rapidly, affecting all business activities, to the extent that it has become impossible to separate any activity from information technology (Alkebsi & Aziz, 2017).

With the acceleration of technological development, all industrial sectors are now required to master information technology to ensure their sustainability and growth. At the forefront of these is the auditing field, which has undergone a fundamental transformation in its methodologies and working practices under the influence of these modern technologies. The effectiveness of internal auditing is measured by its ability to contribute positively to improving the quality of services provided and achieving the strategic objectives of the entity. Accordingly, internal auditing seeks to ensure the optimal use of available resources by providing reliable assurances and specialized consulting aimed at enhancing operational processes and strengthening corporate governance (Ayab et al., 2023). Internal auditors thus need to acquire knowledge and skills related to computerized information systems for purposes of planning, supervision, guidance, reviewing completed work, and reducing the time spent on testing the content and accuracy of accounts (Marwanto & Soepriyanto, 2025).

Moreover, information technology and internal auditing represent essential pillars for improving the quality of financial reports, whether in their traditional form or through various tools such as ERP systems and data analytics that raise the level of accuracy and transparency. Financial reports are the final output of the accounting process, used to assess entities' performance, evaluate their financial position, and identify sources of cash flows and changes in capital, thereby assisting in making sound decisions (Mohamed, 2018). A financial report also represents the process of publishing the official records of the entity's financial activities. For reports to be more effective and easier to use, they must take into consideration specific characteristics, namely: relevance, reliability, comparability, understandability, and consistency (Sina et al., 2021).

• Problem Statement

The interactive relationship between information technology and internal auditing plays a fundamental role in enhancing the quality of financial reports. Accordingly, understanding the integration between information technology and internal auditing has become a strategic necessity for improving the quality of financial reports and achieving sound financial governance within economic entities, particularly in light of the increasing challenges related to transparency and accountability. Based on this, the following main research question can be raised:

How does the use of information technology techniques in internal auditing affect the improvement of financial report quality?

• Significance of the Research

The significance of this research stems from the growing recognition that traditional auditing approaches may no longer suffice in today's digitally-driven business environment. While numerous studies have examined information technology adoption in various organizational contexts, there remains a notable gap in understanding how IT integration specifically

influences internal auditing effectiveness and, consequently, financial reporting quality within the Algerian economic landscape. This study addresses this void by providing empirical evidence from Algerian entities, where the regulatory framework and technological infrastructure present unique challenges and opportunities. Moreover, the study's relevance is particularly pronounced given Algeria's ongoing economic diversification efforts and the government's emphasis on improving transparency in both public and private sectors.

• **Research Objectives**

This research aims to achieve the following interconnected objectives:

- To examine the effect of using information technology techniques on the quality of financial reporting in economic entities;
- To investigate the impact of information technology techniques on the effectiveness of internal audit functions;
- To analyze whether the effectiveness of internal audit mediates the relationship between information technology techniques and the quality of financial reporting;

- To identify the organizational and structural factors that influences the relationship between internal audit and financial reporting quality.

• **Research Methodology**

This research adopts a mixed-method approach, combining a questionnaire and semi-structured interviews to ensure comprehensive analysis. The quantitative data were collected through a survey of 99 employees of internal audit departments in 30 economic entities in Algeria, while the qualitative dimension relied on interviews with 3 internal auditors to capture practical insights. Path analysis was used to test the relationships among the study variables, supported by the interview results that provided contextual explanations.

• **Research Structure**

Following the introduction, which establishes the research context and objectives, this paper presents a comprehensive literature review and hypothesis development section that examines existing scholarly work and formulates testable research propositions. The methodology section then outlines the research design, data collection procedures, and analytical techniques employed in the study. Subsequently, the results section presents the empirical findings and hypotheses testing, followed by the discussion section, which interprets these findings, addresses their implications, and considers their relationship to existing literature. Finally, the conclusion synthesizes the key contributions of the research, acknowledges limitations, and suggests directions for future investigation.

2. Literature Review and Hypothesis Development

This section reviews the prior literature related to the research problem, with a focus on a set of empirical studies that addressed multiple relevant dimensions. These studies discussed information technology techniques, factors of internal audit effectiveness, and the quality of financial reports. The analysis of these studies contributed to building the theoretical framework of the present study and subsequently to the formulation of its hypotheses.

2.1 Information Technology Techniques and Internal Auditing

The relationship between information technology and the internal auditing function has received significant attention in recent studies, due to the variety of determinants influencing the effectiveness of this connection. According to Chi et al. (2024), the impact of information technology techniques on internal auditing can only be realized under certain fundamental conditions, most notably the independence and competence of internal auditing and effective managerial support. Based on these determinants, studies that first focused on effectiveness through managerial support and internal auditor competence will be discussed, followed by studies addressing the impact of using information technology techniques on the effectiveness of internal auditing.

Both Ayab et al. (2023) and Saeed et al. (2022) agreed that managerial support enhances the effective use of information technology techniques in internal auditing within a sample of economic entities in Jordan and Ethiopia. Managerial support was considered a moderating factor in the relationship between the use of information technology techniques and the effectiveness of internal auditing, through management's commitment to facilitating technology adoption and providing modern tools that improve internal audit effectiveness. In contrast, Marwanto and Soepriyanto (2025), in a study conducted in Indonesia, reported different results: managerial support did not register any moderating effect, even though the sample expressed positive evaluations of IT's role in improving their work. The study attributed this outcome to the lack of training of internal auditors, weak management commitment to training, and the limited exploitation of available technological capabilities.

Other studies focused on internal auditor competence as a moderating factor between information technology and internal audit effectiveness. Chi et al. (2024) highlighted that the positive impact of modern technologies cannot be realized without auditors possessing the necessary skills and knowledge to use auditing tools effectively. This finding was supported by Doda and Murthy (2025), who emphasized the importance of developing internal auditors' competencies in mastering IT tools to keep pace with the rapidly changing business environment.

As for the technologies applied in internal auditing, Salur and Kattar (2021) investigated the impact of ERP systems on auditing functions in the context of modern information technology. Based on findings from prior research conducted in Turkey, they concluded that the benefits of applying ERP systems in auditing far outweigh their drawbacks, provided that auditors possess the academic and practical training required to use the system effectively. Wahdan and El-Serafy (2020) supported this conclusion by highlighting ERP's advantages in internal auditing, such as reducing audit costs, minimizing the possibility of errors during data examination, speeding up processing, and increasing accuracy in detecting issues as they arise. Similarly, Silva and Marques (2022), in a study conducted in Portugal, found a direct relationship between the effective use of ERP systems and the academic and practical qualifications of internal auditors. Without sufficient expertise and proper academic background, ERP systems cannot be used effectively. Extending their work, Silva et al. (2023) conducted a second study on the same sample, concluding that ERP use positively influences the effectiveness and efficiency of internal auditing, with auditors expressing overall satisfaction with such systems.

Regarding data analytics systems, Si (2022) examined their impact, noting that their use is not limited to improving data quality but also extends to accelerating audit procedures, allocating resources more accurately, and expanding audit coverage. Al- Khasawneh and Baniata (2024), studying Jordanian banks, showed that relying on simple data analysis tools such as Excel and spreadsheets significantly contributed to conducting analytical procedures and detailed testing, which positively reflected on internal audit performance.

Based on the above, it becomes clear that the use of information technology techniques can contribute to strengthening the effectiveness of the internal auditing function. However, this impact remains contingent upon a set of organizational and human factors. Accordingly, the following hypothesis can be formulated:

H1: There is a positive and statistically significant effect of using information technology techniques on the effectiveness of internal auditing.

2.2 Information Technology and Financial Reports Quality

Many recent studies have shown a general consensus on the vital role that information technology plays in improving the quality of financial reports, as this relationship represents a key axis in the development of accounting information systems and in achieving transparency and accuracy in financial disclosure. In this context, an applied study conducted in the Indonesian public sector found a strong and statistically significant positive relationship between information technology and the quality of financial reports. The use of such systems contributed to reducing errors, accelerating the reporting process, and enhancing the level of transparency and reliability (Rachmad et al., 2024). These results are consistent with the findings of Darwis et al. (2023), who linked IT techniques with organizational factors such as control and human resources, stressing that technology is not effective on its own, but its impact grows stronger in a well-structured organizational environment. Supporting this direction, Mardinan et al. (2018) emphasized the importance of integrating IT with internal control, noting that enhancing reliability and accuracy in reporting can only be achieved in the presence of precise and effective control tools. Conversely, Salehi and Torabi (2012) found that IT enhances the relevance of

accounting information but reduces its reliability; it also slightly increases comparability and contributes to mitigating the negative effects of existing constraints on the qualitative characteristics of accounting information.

According to Sina et al. (2021), there are several dimensions to financial reporting quality, such as relevance, reliability, comparability, and understandability. Technology contributes to improving the quality of companies' financial reports by using IT tools—computers, devices, and software—to support effective decision-making at both strategic and operational levels. While IT use in accounting systems was limited in its early stages, today it has evolved into a broader field supporting ERP systems with business intelligence applications. Meliana and Ansar (2021) found that ERP plays a strategic role in integrating corporate data and reducing operational errors, while producing comprehensive reports that meet both financial and managerial needs, thus enhancing the quality and efficiency of decision-making. Barna et al. (2021) reinforced these findings, classifying ERP systems as a logical development of IT and emphasizing that their optimal effectiveness depends on appropriate organizational support and technically skilled human resources. Such conditions enable ERP systems to reinforce principles of transparency and institutional accuracy.

E'leimat et al. (2023) argued that data analytics represents a qualitative shift in detecting accounting anomalies and improving the accuracy of outputs, in addition to providing real-time analyses based on massive datasets, thereby contributing to more objective decision-making. Mhlanga (2024) further highlighted that integrating data analytics with artificial intelligence and blockchain in reporting systems enhances transparency and trust while limiting accounting manipulations, especially in environments with weak oversight.

The majority of studies emphasize the pivotal role of IT, whether in its traditional form or through its tools, in improving the quality of financial reports. However, this role remains conditional upon a strong institutional structure, including effective internal controls, continuous managerial support, and technically qualified personnel. While ERP is considered an integrative tool with broad strategic impact, data analytics represents a transformative shift that fundamentally improves the accuracy and transparency of reports. Therefore, combining these tools and applying them within a framework of sound governance represents the optimal path toward achieving high-quality financial reporting. Based on these findings, the following hypothesis can be formulated:

H_2: There is a positive and statistically significant effect of using information technology techniques on the quality of financial reports.

2.3 Internal Auditing and Financial Reports Quality

Several studies have shown that the effectiveness of internal auditing is one of the factors influencing the quality of financial reports; however, this impact cannot be realized in isolation from supporting factors. Riyanto and Rapina (2024) identified these supporting factors as compliance with professional standards, the role of the internal auditor in internal control, risk management and governance evaluation, in addition to the presence of audit committees within the entity. This was confirmed by Ebimobowei and Joyce (2024), who clarified that audit independence and the evaluation of control and risk systems are among the most influential determinants, and that the presence of audit committees acts as a moderating factor enhancing this relationship. Similarly, Abbas (2024) found a positive relationship between compliance with professional internal audit standards and the quality of financial reports in a study of three Iraqi banks, where such compliance contributed to achieving the main quality characteristics of relevance and reliability.

In this context, Sari et al. (2024) indicated that reliability improves when risks surrounding financial reports are properly identified and addressed. Meanwhile, both Riyanto and Rapina (2024) and Qadri (2025) argued that achieving relevance is linked to entities' investments in training and developing auditors, as well as adopting digital transformation in auditing and control activities, which contributes to improving accuracy and efficiency in internal work and thus enhances financial report quality.

While most studies stress the significant role of internal audit effectiveness factors in improving financial report quality, Adewara et al. (2023) reported that independence and competence did not affect financial report quality in Nigeria's public sector, as internal auditors suffered from weak independence, which negatively impacted their performance efficiency. Similarly, Bakri et al. (2025) reached the same conclusion, finding that although competence and independence are factors of internal audit effectiveness, they did not show any impact on financial reporting quality. They explained this

by noting that the auditors' role was limited to reviewing work plans without conducting a comprehensive review of financial statements, which resulted in the absence of the expected positive impact.

In light of the above, it becomes evident that internal audit effectiveness impacts financial report quality only through a set of organizational and professional factors, such as independence, compliance with standards, and the presence of audit committees. Accordingly, the following hypothesis can be formulated to measure the nature of this effect:

H₁: There is a positive and statistically significant effect of internal audit effectiveness on the quality of financial reports.

2.4 Information Technology Techniques, Internal Auditing, and Financial Reports Quality

Internal auditing has undergone remarkable development over time, both in terms of standards and independence, especially with the emergence of digital transformation, which has enhanced its effectiveness, particularly in areas such as control, risk assessment, and governance, in improving the quality of financial reports. Internal auditing is considered one of the essential pillars for ensuring the credibility of financial information and its proper disclosure.

In this context, numerous studies have agreed that the use of information technology techniques by internal auditors contributes to improving audit effectiveness and thereby increasing its role in enhancing financial report quality. Mohamed et al. (2022) found a positive relationship between internal audit effectiveness and financial report quality in the context of digital transformation, through its role in control, risk management, and strengthening governance. Internal auditors were able to prepare accurate reports that enhanced the reliability and relevance of financial information. Similarly, Nhial et al. (2025) confirmed that adopting IT techniques enables auditors to improve report quality by enhancing its secondary characteristics, such as comparability and understandability. These techniques contribute to unifying and harmonizing data, providing accurate and easily interpretable financial information for users.

The literature indicates that IT techniques enhance the effectiveness of internal auditing, which in turn positively affects the quality of financial reports. Hence, the study's main hypothesis can be formulated to test this triangular relationship:

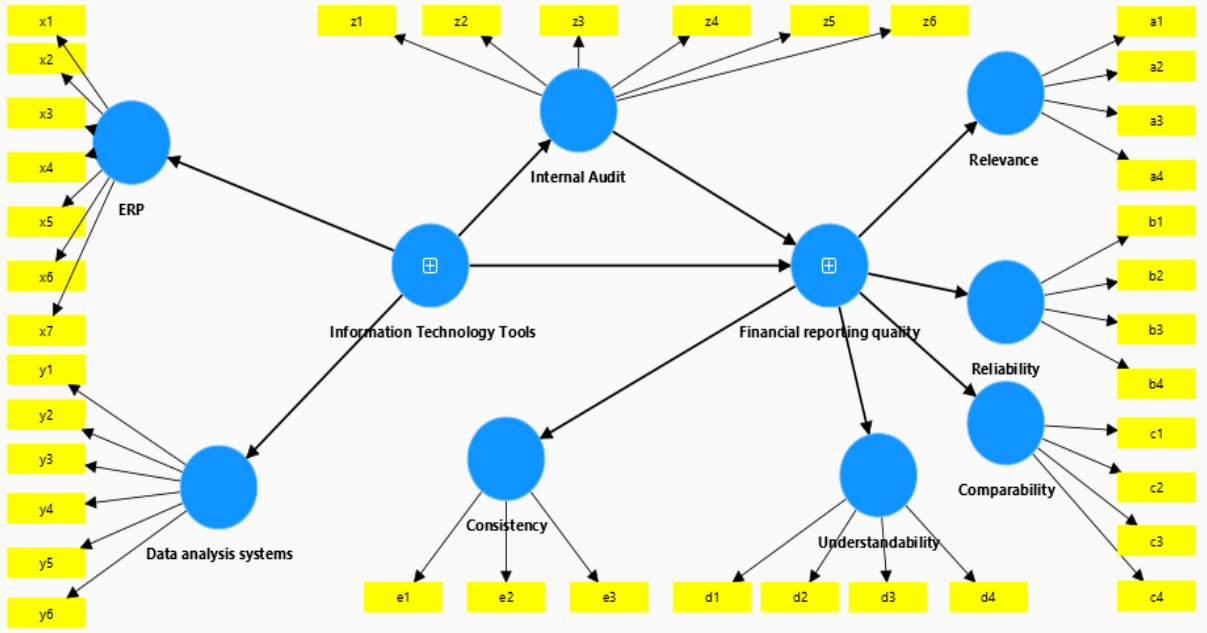
H₂: There is a positive and statistically significant effect of using information technology techniques in internal auditing on the quality of financial reports.

3. Methods

3.1 Model and Definition of Variables

The study adopted an analytical-exploratory approach by applying Structural Equation Modeling using the Partial Least Squares method (SEM-PLS) through the SmartPLS 4 software. The aim was to examine the effect of using information technology techniques in internal auditing on the quality of financial reports within a sample of economic entities in Algeria. The preliminary model of the study was developed based on previous literature, as illustrated in figure 1.

Figure 1. Study's Initial Model



Source: Authors based on SmartPLS 4 software outputs.

The model illustrates the path coefficients linking all the study variables, as well as the paths connecting each variable to its indicators. The study variables are divided into independent, dependent, and mediating variables, as shown in Table 1.

Table 1: Description of Study Variables

Variable	Type	Description
Information Technology Techniques	Independent Variable	Comprises two dimensions, namely Enterprise Resource Planning (ERP) systems and Data Analytics systems, which were used to measure their impact on both internal auditing and the quality of financial reports.
Internal Auditing	Mediating Variable	Consists of a set of items related to the extent of the auditor's use of the techniques adopted in the study, aiming to determine the level of influence on the effectiveness of the function.
Quality of Financial Reports	Dependent Variable	Comprises five dimensions representing the primary and secondary qualitative characteristics: relevance, reliability, comparability, understandability, and consistency. These were established to measure the quality level of financial reports.

Source: Authors

3.2 Research Population and Sampling Strategy

The study population consists of all economic entities in Algeria that have an internal audit department. The sample was selected in a semi-purposive manner and included 30 economic entities. The questionnaire was distributed electronically to the study sample through LinkedIn messaging and email correspondence. A total of 120 questionnaires were distributed to employees of internal audit departments, of which 105 were retrieved. After reviewing and screening them,

99 questionnaires were found valid for statistical analysis. The sample comprised heads of internal audit departments, senior internal auditors, and assistant internal auditors.

The respondents' demographic profile is presented in table 2.

Table 2: Distribution of the Sample According to Demographic Variables

Demographic Variables	Category	Frequency
Job Position	Head of Internal Audit Dept.	48
	Senior Internal Auditor	36
	Assistant Internal Auditor	15
Educational Qualification	Bachelor's Degree	26
	Master's Degree	55
	Magister	12
	Doctorate	5
	Other	1
Years of Professional Experience	Less than 5 years	17
	5 to 10 years	22
	11 to 15 years	23
	More than 15 years	37
Field of Specialization	Accounting	19
	Auditing	42
	Finance	34
	Other	4

Source: Authors based on the questionnaire's results

The study sample demonstrated in Table 2 consisted of 99 internal audit employees from 30 economic entities. The majority were heads of internal audit departments (48) and senior internal auditors (36). Most respondents held a Master's degree (55), followed by a Bachelor's degree (26), with professional experience largely exceeding 10 years (60). In terms of specialization, auditing (42) and finance (34) were the most represented fields.

Moreover, interviews were conducted with three economic entities, namely:

- El Hadjar Iron and Steel Complex: The largest iron and steel complex in Algeria, established in 1969. It is an industrial entity located in Annaba, in eastern Algeria;

- Ooredoo: A service-oriented entity founded in 1997 under the name Wataniya Telecom, later renamed Ooredoo after the Qatari Ooredoo Group acquired the majority stake;
- ASROUT (Road Network Maintenance and Sanitation Company): An entity of an industrial and commercial nature, headquartered in Algiers. It was established in 1995 and specializes in road works and sanitation.

3.3 Data Collection Instruments and Procedures

The study relied on the questionnaire as the primary tool for data collection, which was distributed electronically to the study sample. The questionnaire consisted of two main sections:

- A section on respondents' personal information.
- A section on the main themes of the study, represented by three axes corresponding to the study variables. Each axis included a set of dimensions measured using a five-point Likert scale (the survey instrument is included in the appendices).

In addition, a secondary tool was employed to support the findings, namely the interview, which was conducted with heads of internal audit departments in the aforementioned entities. The interview form contained three main questions:

- Based on your professional experience, what are the factors influencing the internal audit function?
- What programs and technologies are used within your entity that contribute to improving the quality of internal auditors' work?
- How can an internal auditor who relies on modern programs available within your entity enhance disclosure and transparency in financial reports?

3.3 Data Analysis Technique

The data from the 99 valid questionnaires were analyzed using Structural Equation Modeling (SEM) via the Partial Least Squares (PLS) approach, operationalized in the SMARTPLS 4 software. PLS-SEM was selected for its suitability for predictive research models with complex relationships and multiple latent variables. The analysis was conducted in three stages:

- Assessment of the Measurement Model: Evaluating the reliability and validity (convergent and discriminant) of the constructs.
- Assessment of the Structural Model: Examining the predictive power and relationships between the constructs.
- Hypothesis Testing: Evaluating the statistical significance of the path coefficients to test the study's main hypotheses.

4. Results

4.1 Assessment of the Measurement Model

The assessment of the measurement model is considered the first step in Structural Equation Modeling using the Partial Least Squares method (PLS-SEM). At this stage, convergent validity, internal consistency, and discriminant validity are verified. The results of these assessments are presented in Tables 3 and 4.

Table 3: Convergent Validity and Internal Consistency

Dimensions of the study	CR	Rho a	Rho c	AVE
Enterprise Resource Planning	0.815	0.818	0.867	0.521
Data Analysis systems	0.747	0.772	0.835	0.511

Internal Audit	0.852	0.852	0.889	0.572
Relevance	0.813	0.812	0.877	0.641
Reliability	0.877	0.890	0.916	0.732
Comparability	0.911	0.913	0.938	0.790
Understandability	0.901	0.904	0.931	0.772
Consistency	0.869	0.887	0.920	0.793

Source: SmartPLS 4 software outputs

The results of the table 3 can be interpreted as follows:

- **Convergent validity**: The primary objective of this test is to examine the level of consistency among the questionnaire items. To achieve this, indicator reliability was assessed, which requires each indicator's loading value to exceed 0.7. This condition was not met for indicators Y2 and X6, which necessitated their removal to improve composite reliability. In addition, the Average Variance Extracted (AVE) test was used, which requires all values to equal or exceed 0.5. According to the results of the table, all latent variables recorded values greater than 0.5, indicating that each dimension is capable of explaining more than half of the variance in its associated indicators. Therefore, it can be concluded that convergent validity is achieved in the model.
- **Internal consistency:** Internal consistency is assessed using two main indicators: Cronbach's Alpha and Composite Reliability. The results show that all Cronbach's Alpha values exceeded the 0.6 threshold, ranging between 0.747 and 0.911. These are acceptable and strong values that reflect a high level of internal reliability. Similarly, Composite Reliability values exceeded the 0.7 threshold, allowing us to conclude that all latent variables demonstrate a good level of reliability.

Table 4 : Fornell-Larcker Test

	COM	CON	DAS	ERP	IA	REV	REL	UNDE
COM	0.889							
CON	0.616	0.890

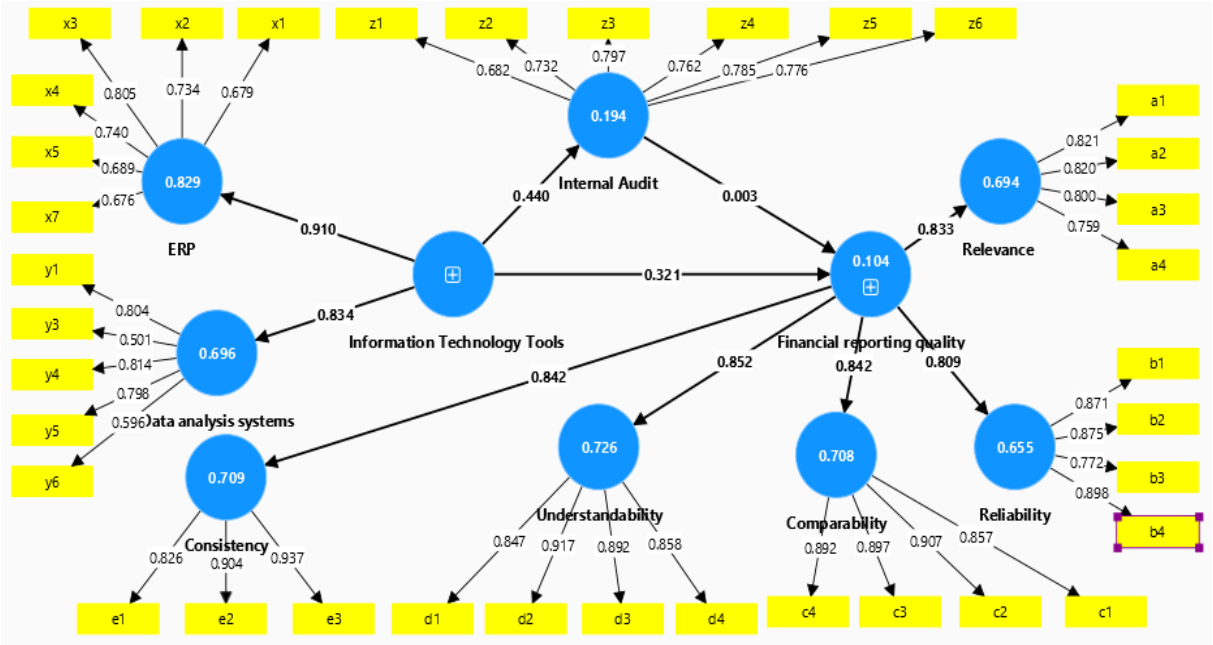
Source: SmartPLS 4 software outputs

The results of Table 4 show that each latent variable in the model represents itself with the highest value in the Fornell-Larcker criterion. For example, the ERP system variable achieved a value of 0.722 with itself, which is the highest value either across rows or columns, indicating its correlation with the other latent variables. Similarly, each of the other dimensions records the highest correlation value with itself compared to the remaining variables. This confirms that each dimension enjoys a clear degree of distinctiveness from the others, thereby meeting the requirement of discriminant validity according to the Fornell-Larcker criterion.

Through the evaluation of the reflective measurement model of the study, it is evident that the data are valid and reliable, and that the remaining indicators are appropriate for addressing the research problem and testing its hypotheses. After evaluating and verifying the measurement model, the general model of the study was reached, which will be relied upon in analyzing the structural model and testing the hypotheses, as represented in Figure 2.

Figure 2: The General Structural Model of the Study



Source: SmartPLS 4 software outputs

Figure 2 illustrates the general model after removing two statistically insignificant indicators in order to enhance internal consistency and test the Average Variance Extracted (AVE). After verifying the reflective measurement model evaluation tests, the study can proceed with analyzing the structural model and testing the hypotheses.

4.2 Structural Model Analysis

After completing the analysis of the reflective measurement model and ensuring the validity and reliability of the model in measuring the variables, the next step is to analyze the structural model. This stage aims to test the hypotheses by evaluating the path coefficients and examining their statistical significance, in addition to studying the Variance Inflation Factor (VIF) and estimating the effect sizes among the variables.

- **Variance Inflation Factor (VIF):** Before testing the coefficients of the structural model, it is necessary to examine multicollinearity to ensure that the results are not biased. This step is complementary to the evaluation of the reflective measurement model. The VIF value should not exceed 3 and should not be less than 0.2. Table 5 presents the results of this coefficient:

Table 5: Variance Inflation Factor (VIF)

		VIF
Informations technology techniques	→ Enterprise Resource Planning	1.000
Information technology techniques	→ Data Analysis Systems	1.000
Informations technology techniques	→ Internal Audit	1.000
Informations technology techniques	→ Financial reporting quality	1.241
Internal Audit	→ Financial reporting quality	1.241
financial reporting quality	→ Relevance	1.000
financial reporting quality	→ Reliability	1.000
financial reporting quality	→ Comparability	1.000
financial reporting quality	→ Understandability	1.000
financial reporting quality	→ Consistency	1.000

Source: SmartPLS 4 software outputs

The results in Table 5 show no multicollinearity among the exogenous and endogenous latent variables, as the Variance Inflation Factor values ranged between 1.000 and 1.241, which are below the threshold of 3. Therefore, these values can be reliably used to assess the structural model's path coefficients and to test the study's hypotheses without removing any variable.

- **Coefficient of Determination (R^2):** This is used to measure the extent to which exogenous latent variables explain the endogenous latent variables. The explanatory power is classified as follows: above 0.67 indicates strong explanatory power, between 0.33 and 0.67 indicates moderate explanatory power, between 0.12 and 0.33 indicates weak explanatory power, and below 0.12 indicates no explanatory power.

Table 6: Coefficients of Determination (R^2) for the Study Model

	R-square	R-square adjusted
Informations technology techniques + Internal Audit	0.157	0.140
Informations technology techniques	0.242	0.234

Source: SmartPLS 4 software outputs

It is evident from Table 6 that the independent variable together with the mediating variable are able to explain financial reporting quality only to a weak degree, as the value of the coefficient of determination (R^2) for the model reached 0.157, meaning that only 15.7% of the variance in financial reporting quality is explained. The adjusted coefficient of determination (Adjusted R^2) was 0.140, reflecting a reduction in the explanatory power of the model when the number of variables is taken into account. In contrast, when using the independent variable alone, the value of the coefficient of determination increased to 0.242, and the adjusted R^2 to 0.234, indicating that this variable alone has a stronger

explanatory ability for financial reporting quality. Therefore, the results suggest that introducing "internal auditing" as a mediating variable did not enhance the model's effectiveness; instead, it led to a decrease in explanatory power.

- **Effect Size (F^2) Evaluation:** The effect size is judged according to the following criteria:
  - Less than 0.02 → No effect
  - From 0.02 to 0.15 → Weak effect
  - From 0.15 to 0.35 → Moderate effect
  - Greater than 0.35 → Strong effect

Table 7: Effect Size Results

	financial reporting quality	Internal Audit
Internal Audit	0.003	-
Informations technology techniques	0.160	0.319

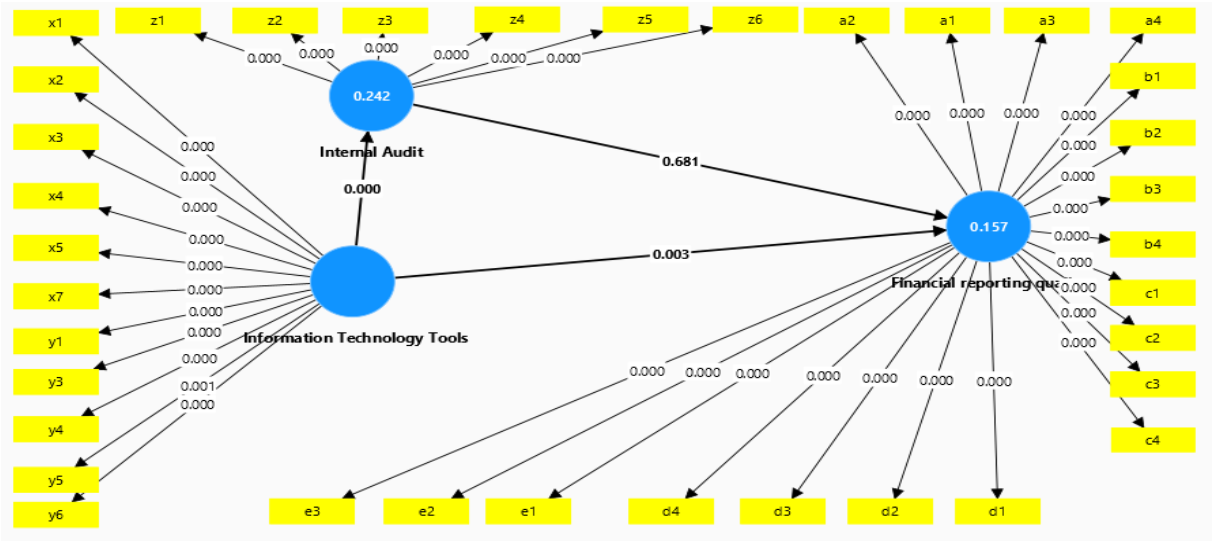
Source: SmartPLS 4 software outputs

The analysis results of the effect sizes presented in Table 7 indicate that *internal audit* does not have a significant direct impact on the quality of financial reports, with an effect size of 0.003, which is extremely weak and lacks practical significance. In contrast, the findings revealed that information technology techniques represent the relatively stronger factor in the model, with a direct effect size of 0.160 on the quality of financial reports, reflecting a moderate effect. Moreover, the results showed that IT techniques significantly contribute to strengthening internal audit, with an effect size of 0.319, which also represents a moderate influence, pointing to their role in enhancing the efficiency and effectiveness of internal audit procedures. Based on these findings, it can be concluded that information technology techniques have both a direct and indirect role in influencing the quality of financial reports. They directly improve report quality and indirectly do so by boosting internal audit performance. Although the indirect effect remains weak, its relative contribution can be effective within the mediating relationship between IT techniques and financial reporting quality.

4.3 Hypotheses Testing

After completing the measurement and structural evaluation of the study's overall model and confirming its suitability for hypothesis testing and deriving the study's findings, the hypotheses are tested by assessing the fit and significance of the relationships within the structural model, referred to as path coefficients, as illustrated in Figure 3. Meanwhile, Table 8 presents the results of fit and significance between the relationships of the structural model, based on which the study's hypotheses will be either rejected or accepted.

Figure 3: Path Coefficients of the Study's Main Variables



Source: SmartPLS 4 software outputs

Table 8: Path Analysis

Decision	p-values	t-statistics	Original Sample	Hypotheses	Type of Effect
Accepted	0.000	6.544	0.492	1	Direct
Accepted	0.003	2.929	0.422	2	
Rejected	0.681	0.411	-0.058	3	
Rejected	0.705	0.379	-0.029	4	Indirect

Source: SmartPLS 4 software outputs

Testing the First Hypothesis

The first hypothesis is formulated as follows:

- H_0: There is no positive and statistically significant effect of the use of information technology techniques on the effectiveness of internal auditing.
- H_1: There is a positive and statistically significant effect of the use of information technology techniques on the effectiveness of internal auditing.

The results in Table 7 show that the path coefficient value reached 0.492, which is much greater than 0, indicating a strong relationship between the independent variable and the mediating variable. The T-value was estimated at 6.544, which exceeds the threshold of T = 1.96 at a significance level of 0.05. We also find that the P-value is 0.000, which is less than

0.05. Therefore, the effect between the two variables is statistically significant, meaning that the use of information technology techniques has a positive effect on the effectiveness of internal auditing. This leads to the acceptance of the alternative hypothesis and the rejection of the null hypothesis.

Testing the Second Hypothesis

The second hypothesis is formulated as follows:

- H_0: There is no positive and statistically significant effect of the use of information technology techniques on the quality of financial reporting.
- H_1: There is a positive and statistically significant effect of the use of information technology techniques on the quality of financial reporting.

The results in Table 7 show that the path coefficient value reached 0.422, which is greater than 0, indicating a strong relationship between the independent variable and the dependent variable. The T-value was estimated at 2.929, which exceeds the threshold of T = 1.96 at a significance level of 0.05. We also find that the P-value is 0.003, which is less than 0.05. Therefore, the effect between the two variables is statistically significant, meaning that the use of information technology techniques has a positive effect on the quality of financial reporting. This leads to the acceptance of the alternative hypothesis and the rejection of the null hypothesis.

Testing the Third Hypothesis

The third hypothesis is formulated as follows:

- H_0: There is no positive and statistically significant effect of internal audit effectiveness on the quality of financial reporting.
- H_1: There is a positive and statistically significant effect of internal audit effectiveness on the quality of financial reporting.

The results in Table 7 show that the path coefficient value reached -0.058, which is less than 0, indicating the absence of a strong relationship between the mediating variable and the dependent variable. The T-value was estimated at 0.411, which is lower than the threshold of T = 1.96 at a significance level of 0.05. We also find that the P-value is 0.681, which is greater than 0.05. Therefore, the effect between the two variables is not statistically significant, meaning that internal audit effectiveness does not have a positive effect on the quality of financial reporting. This leads to the rejection of the alternative hypothesis and the acceptance of the null hypothesis.

Testing the Fourth Hypothesis

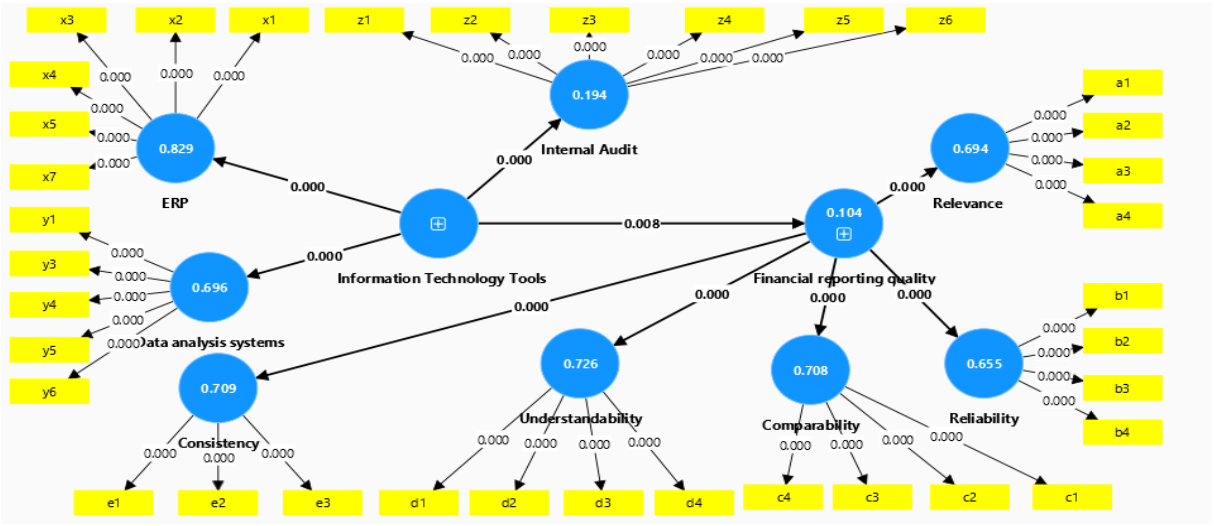
The fourth hypothesis is formulated as follows:

- H_0: There is no positive and statistically significant effect of using information technology techniques in internal auditing on the quality of financial reporting.
- H_1: There is a positive and statistically significant effect of using information technology techniques in internal auditing on the quality of financial reporting.

The results show that the path coefficient value reached -0.029, which is less than 0, indicating the absence of a strong relationship between the independent and dependent variables when internal auditing is used as a mediating variable. The T-value was estimated at 0.379, which is lower than the threshold of T = 1.96 at a significance level of 0.05. We also find that the P-value is 0.705, which is greater than 0.05. Therefore, the effect among the variables is not statistically significant, meaning that the use of information technology techniques in internal auditing does not have a positive effect on the quality of financial reporting. This leads to the rejection of the alternative hypothesis and the acceptance of the null hypothesis.

Finally, the study arrives at the model that represents the final results, relying on structural equation modeling using the partial least squares (PLS) method, as illustrated in Figure 5.

Figure 5: The Modified Structural Model



Source: SmartPLS 4 software outputs

Figure 5 is considered a general summary of the statistical study, where it was concluded that the use of information technology techniques has a positive effect on both the effectiveness of internal auditing and the quality of financial reports. In contrast, using internal auditing as a mediating variable did not result in a positive effect. Moreover, the study found no effect of the internal auditing function on the quality of financial reports, which led to the removal of the path linking internal auditing to financial reporting quality.

5. Discussion

5.1 The Effect of Information Technology Techniques on the Effectiveness of Internal Auditing

The results of the path analysis revealed a positive and statistically significant effect of using information technology techniques on the effectiveness of internal auditing, based on responses from a sample of internal auditors in economic entities in Algeria. This indicates that the auditors' use of simple data analysis systems and ERP systems has enhanced the accuracy and efficiency of their work.

This result is consistent with the findings of Chi et al. (2024), Ayab et al. (2023), and Saeed et al. (2022), who confirmed the existence of a positive relationship between information technology techniques and internal auditing. Information technology was considered one of the most important factors in improving the effectiveness of internal auditing. Likewise, Silva et al. (2023) demonstrated that the use of ERP systems had a positive impact on the effectiveness of internal auditing in Portugal, while Al- Khasawneh and Baniata (2024) showed that simple data analysis systems improved auditors' performance in Jordanian banks. However, this result contrasts with the findings of Marwanto and Soepriyanto (2025), who showed that information technology does not have a significant effect on the effectiveness of internal auditing in public institutions in Indonesia.

According to the interview sample responses, the use of ERP systems and simple data analysis tools, whether through Excel, dashboards, or other supporting software, contributed significantly to improving auditors' performance by increasing accuracy, accelerating task completion, and simplifying procedures.

5.2 The Effect of Information Technology Techniques on the Quality of Financial Reports

The results of the path analysis indicated a positive and statistically significant effect of the use of information technology techniques on the quality of financial reports for a sample of economic entities in Algeria. This implies that the investment of entities in adopting information technology techniques, such as simple data analysis systems and ERP systems, contributed to improving the quality and transparency of their financial reports.

This finding was confirmed by the studies of Rachmad et al. (2024), Darwis et al. (2023), and Meliana and Ansar (2021), which all highlighted the strong positive relationship between information technology and the quality of financial reports. The use of these systems helped reduce errors, accelerate the reporting process, and enhance transparency and reliability. On the other hand, this result contrasts with the findings of Salehi and Torabi (2012), which stated that while information technology enhances the relevance of accounting information, it simultaneously undermines its reliability, and only marginally increases comparability.

Based on the interview sample responses, this result can be explained by the fact that the adoption of information technology techniques by the concerned entities significantly contributed to improving the relevance and reliability of the information disclosed in their financial reports. This was achieved through providing accurate systems for data processing, reducing the likelihood of errors or manipulation, and facilitating timely access to information, which enhances transparency and strengthens user confidence in those reports.

5.3 The Effect of Internal Audit Effectiveness on the Quality of Financial Reports

The results of the path analysis indicate the absence of a statistically significant effect of internal auditing on the quality of financial reports, based on the responses of a sample of internal auditors in economic entities in Algeria. This suggests that there is no direct and clear relationship between the effectiveness of internal auditing and the quality of financial reports.

This result supports the findings of Adewara et al. (2023) and Bakri et al. (2025) who pointed out that the effectiveness of internal auditing does not have a tangible positive impact on the quality of financial reports in public entities in Nigeria and Indonesia, due to the weak role of internal auditors in those entities. In contrast, this result contradicts many previous studies, such as Ebimobowei and Joyce (2024), which emphasized the vital role of internal auditors in improving the quality of financial reports. Similarly, the studies of Sari et al. (2024), Riyanto and Rapina (2024), and Qadri (2025) showed that internal auditing has a significant effect in enhancing the relevance and reliability of information in financial reports through its contribution to evaluating internal control systems, risk management, and governance.

Interview results revealed that the primary reason for this finding is the absence of audit committees in most Algerian entities, in addition to the lack of effective implementation of internal auditor recommendations. One interviewed internal auditor mentioned the existence of significant overlap in duties within his entity, as he was responsible for both internal auditing and management control simultaneously. Another auditor stated that he had to temporarily assume the tasks of an accountant in the absence of the designated employee, which negatively affected his independence and objectivity, and consequently, the effectiveness of his monitoring role.

5.4 The Impact of Using Information Technology Techniques in Internal Auditing on the Quality of Financial Reporting

The results of the path analysis showed no statistically significant effect of information technology techniques on the quality of financial reporting when internal auditing was adopted as a mediating variable in this relationship. The reason for this is the absence of any effect between the effectiveness of internal auditing and the quality of financial reporting for a sample of economic entities in Algeria.

This finding contradicts Mohamed et al. (2022), who found a strong relationship between information technology techniques and the quality of financial reporting when used by internal auditors in economic entities in Egypt. Similarly, Nhial et al. (2025) confirmed that information technology techniques employed in the internal auditing departments of economic entities in Sudan contribute to improving the understandability, comparability, and reliability of the disclosed financial information.

This result was interpreted, based on previous findings and the opinions of the interview sample, as indicating that the lack of a clear effect of internal auditing on the quality of financial reporting does not necessarily stem from weaknesses in auditors' competencies or in the tools used, but rather from the absence of a supportive organizational environment within the concerned entities. This deficiency is also attributed to the limited realization of independence and objectivity. The interviews revealed that auditors are often assigned additional tasks that overlap with their auditing responsibilities, which negatively affects their professional role. Marwanto and Soepriyanto (2025) supported this argument, noting management's limited interest in developing the internal audit function due to the scarcity of training programs and the lack of investment in enhancing the competencies of auditors in public entities in Indonesia. This applies equally to the Algerian economic entities under study, where the interviewees confirmed this trend, pointing out that entities do not provide specialized software for internal auditing that could make a significant difference in performance efficiency and result accuracy. This reflects the weakness of the necessary infrastructure to activate the role of internal auditing effectively in improving the quality of financial reporting, in addition to the incomplete implementation of internal auditors' recommendations regarding the quality of financial statements and accounts, which is due to the reliance on external parties to perform this function. This further confirms the weakness of the internal audit function in the concerned entities.

6. Conclusion

This study aimed to examine the impact of using information technology techniques in internal auditing on the quality of financial reporting, with a particular focus on ERP systems and simple data analysis tools. This was carried out by analyzing the extent to which these techniques influence the effectiveness of internal auditing and their reflection on the primary and secondary characteristics of financial information quality, based on the responses of a sample of internal auditors in economic entities in Algeria. The study reached a set of results that can be summarized as follows:

- The use of information technology techniques, especially ERP systems, has a positive impact on enhancing the effectiveness of internal auditing by facilitating access to necessary information and improving its processing;
- Information technology techniques contribute to improving the quality of financial reporting by supporting disclosure processes and increasing the accuracy and reliability of information;
- Administrative support plays a pivotal role in strengthening the relationship between internal auditing and the quality of financial reporting;
- The absence of audit committees in the entities under study negatively affected the independence of the internal audit function;
- The overlap of internal auditors' tasks led to a weakening of their objectivity, reducing the effectiveness of their role in improving the quality of financial reporting;
- There is no statistically significant effect of using information technology techniques in internal auditing on the quality of financial reporting due to weak implementation of internal auditors' recommendations;
- Other factors are relied upon by the entities under study to improve the quality of financial reporting, such as external auditors.

Based on the findings, the current study recommends the following:

- Internal auditors should ensure the continuous development of their skills in using modern information technology tools;
- Internal auditors should strictly adhere to their scope of work without interfering in the execution of other tasks under any circumstances, in order to maintain their objectivity during the performance of their duties;

- Senior management should commit to implementing the recommendations of internal auditors included in their final reports and justify any recommendation that is not taken into consideration;

- Economic entities in Algeria should invest in acquiring technology-based programs that support the internal auditing process;

- Audit committees should be established within entities to ensure the independence of internal auditors, thereby enhancing the quality of their results;

- Continuous training and development programs should be provided for employees in the internal audit department to build their skills and strengthen their ability to perform tasks efficiently and professionally.

Future research could expand the scope of investigation by examining a larger sample of economic entities across different sectors and regions, in order to capture sectoral variations and provide a more comprehensive understanding of the relationship between information technology techniques, internal auditing, and the quality of financial reporting. Moreover, comparative studies between economic entities in Algeria and those in other countries with more advanced auditing practices would help to highlight contextual differences and identify best practices that could be adopted locally. Further research could also focus on the role of audit committees and corporate governance mechanisms in strengthening the independence and effectiveness of internal auditing, thereby enhancing the quality of financial reporting.

Acknowledgement

The authors would like to express their sincere gratitude to the internal auditors and employees of the economic entities in Algeria who participated in this study and provided valuable insights. Special thanks are extended to the University of Constantine 2 Abdelhamid Mehri and the University Center of Abdelhafid Boussouf Mila for their institutional support, which facilitated the completion of this research. The authors are also grateful to colleagues and peers who offered constructive feedback during the development of this work.

Conflict of Interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Appendices

Appendix A: Questionnaire Items

No.	Statement	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
Axis One: Information Technology Techniques						
Dimension One: Enterprise Resource Planning (ERP) System						
01	The ERP system operates efficiently and continuously without interruption.					
02	The ERP system allows easy and timely access to the necessary information.					
03	The ERP system provides detailed and regularly updated reports to support decision-making processes.					
04	The ERP system organizes internal operations and ensures coordination between different departments and units.					
05	The ERP system allows continuous updating and reviewing of information to ensure its accuracy.					
06	The ERP system ensures high levels of security to protect the economic entity's data.					
07	The ERP system contributes to improving operations by providing innovative solutions that support the economic entity's decisions.					
Dimension Two: Data Analysis Systems						
01	Data analysis systems contribute to obtaining accurate and error-free results.					
02	Data analysis systems improve the quality of operations execution and reduce the need for manual intervention.					
03	Data analysis systems perform tasks efficiently, effectively, and in a timely manner.					
04	Data analysis systems provide accurate analyses that assist in making strategic decisions.					
05	Data analysis systems contribute to enhancing					

	transparency by providing reports that can be analyzed and reviewed.					
06	Data analysis systems ensure the protection of information from unauthorized access.					

Axis Two: Internal Audit Function

No.	Statement	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
01	Internal auditing supported by information technology contributes to improving the effectiveness of the entity's financial operations.					
02	Internal auditing enhances credibility and transparency within the entity through the use of data analysis systems.					
03	Internal auditing helps reduce potential risks by accurately tracking financial operations through the ERP system.					
04	Information technology systems help save time and effort during the implementation of internal audit procedures.					
05	Information technology techniques contribute to improving the efficiency of the internal auditor.					
06	Information technology techniques improve internal audit procedures and facilitate the examination of financial records and ledgers.					

Axis Three: Financial Reporting Quality

Dimension 1: Relevance

No.	Statement	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
01	Financial reports contain additional details that enable users to make appropriate decisions.					
02	The information provided in financial reports helps predict the future of the					

	entity.					
03	Financial reports include accounting information capable of influencing users' decisions.					
04	The entity ensures the issuance of financial reports on a periodic basis.					
Dimension 2: Reliability						
No.	**Statement**	**Strongly Agree**	**Agree**	**Neutral**	**Disagree**	**Strongly Disagree**
01	The information in financial reports reflects the truthfulness of economic events that occurred during the period.					
02	Financial reports contain unbiased information.					
03	Financial reports contain error-free information.					
04	Financial reports contain information that is objective and verifiable.					
Dimension 3: Comparability						
No.	**Statement**	**Strongly Agree**	**Agree**	**Neutral**	**Disagree**	**Strongly Disagree**
01	The financial reports issued by the entity include information comparable with the results of similar entities.					
02	The financial reports issued by the entity include information comparable with the results of previous periods of the same entity.					
03	The entity complies with accounting principles and adopted standards when preparing financial reports.					
04	Providing comparability in financial reports increases their efficiency and effectiveness.					
Dimension 4: Understandability						

No.	Statement	Strongly Agree	Agree		Disagree	Strongly Disagree
01	The accounting information disclosed in the reports is easy to understand for all users.					
02	Financial reports are prepared and written in clear and simple language.					
03	The entity ensures that the necessary information is provided without being overly brief or overly detailed to the point of losing meaning.					
04	Graphs and charts are used in financial reports to illustrate and facilitate the understanding of information visually.					
	Dimension 5: Consistency					
No.	**Statement**	Strongly Agree			Disagree	Strongly Disagree
01	The entity ensures that financial statements are prepared using the same methods adopted in previous years and in accordance with the same policies.					
02	The entity accompanies its financial reports with appendices that explain all changes in the preparation and evaluation methods of financial reports.					
03	The principle of consistency is adhered to when preparing and presenting disclosed financial reports.

Keywords influencer marketing, interactive advertising, personalized media intermediary, virtual influencer

Abstract

The rapid evolution of digital technologies and the growing dominance of social media platforms have transformed the nature of advertising. Traditional influencers, who once played a central role in establishing brand–audience connections, are increasingly being complemented or replaced by virtual influencers (VIs). These algorithmically generated personas, developed using artificial intelligence, computer graphics, and machine learning, can autonomously produce content, interact with audiences, and serve as brand representatives in interactive advertising campaigns.

This study explores the phenomenon of virtual influencers in the global and Russian advertising ecosystems, analyzing their communicative potential, economic effectiveness, and ethical implications. The research adopts a qualitative-analytical approach, drawing on secondary data, case studies, and theoretical insights from media studies, marketing science, and cultural theory. Findings suggest that VIs offer significant advantages in terms of brand control, personalization, cost efficiency, and cross-platform integration. However, challenges persist, including audience skepticism, questions of authenticity, and ethical dilemmas regarding transparency, manipulation, and identity construction.

The paper highlights pioneering efforts in Russia where media companies, startups, and advertising agencies have experimented with virtual influencer technologies. These include the use of digital avatars in branding campaigns, cultural promotion, and commercial advertising, illustrating the potential of VIs as both cultural products and marketing tools. The authors conclude that while VIs are not likely to fully replace human influencers, their integration into interactive advertising strategies will expand, particularly as AI-driven personalization and immersive technologies continue to advance.

Introduction

The twenty-first century has been marked by the convergence of technological progress and consumer culture, reshaping the modes of communication between brands and audiences. Social media platforms such as Instagram, TikTok, and YouTube have popularized influencer marketing as a dominant form of interactive advertising. Influencers, who initially emerged as niche content creators, gradually became powerful media

intermediaries, shaping consumer preferences and purchasing behavior through perceived authenticity and peer-like interaction.

However, as the influencer market grew, challenges emerged: rising costs of collaboration, scandals affecting influencer credibility, and audience fatigue toward repetitive advertising content. In this context, virtual influencers (VIs)—digitally created characters that simulate human-like appearance, behavior, and communication—have emerged as a transformative innovation. Unlike human influencers, VIs are entirely controlled by their creators, ensuring consistency, scalability, and brand alignment.

Globally, examples such as Lil Miquela (USA), Imma (Japan), and Shudu Gram (UK/South Africa) demonstrate how VIs can attract millions of followers, collaborate with luxury brands, and even advocate for social issues. They blur the boundaries between reality and simulation, challenging traditional notions of authenticity while offering marketers a new medium for interactive advertising.

In Russia, the phenomenon is relatively recent but increasingly relevant. The interplay of technological development, cultural identity, and marketing innovation provides fertile ground for the adaptation of VIs. This paper seeks to analyze their emergence and role within Russia's advertising ecosystem, situating the discussion in broader global trends.

The objectives of this study are threefold:

1. To define the communicative and economic significance of VIs in interactive advertising.
2. To examine their implementation in Russia, focusing on case studies and industry efforts.
3. To assess the ethical and cultural challenges posed by virtual media personas.

By addressing these aims, the paper contributes to the literature on digital marketing and offers practical implications for advertisers, cultural policymakers, and media scholars.

Chapter 1: Efforts in Russia

Russia's advertising industry has traditionally demonstrated adaptability to global innovations while preserving cultural specificity. The adoption of virtual influencers exemplifies this tendency, blending international technological trends with local cultural narratives.

1.1 Early Experiments

The first Russian experiments with VIs appeared around 2018–2019, when creative agencies and independent digital artists began developing avatars for social media campaigns. These efforts were initially experimental, aimed at testing audience engagement with synthetic personas.

1.2 Industry Engagement

Several Russian advertising agencies have since integrated VIs into campaigns. Avatars were used in fashion and beauty promotions, particularly targeting younger audiences accustomed to digital aesthetics. Some banks and technology firms also experimented with virtual assistants doubling as influencers, merging marketing communication with customer service.

1.3 Cultural and Ethical Dimensions

In Russia, debates surrounding authenticity and cultural identity significantly shape audience reception of VIs. While younger consumers show curiosity and acceptance, older demographics often express skepticism toward artificial personas. Ethical discussions also highlight transparency, with regulators considering whether audiences must always be informed that a VI is non-human.

1.4 Government and Institutional Support

Russia's broader strategy for digital transformation and AI development, articulated in state programs, indirectly supports the rise of VIs. Universities and research centers have begun exploring applications of AI in media, including avatar creation, natural language generation, and sentiment analysis. This suggests that the institutional groundwork for expanding VI usage is already being laid.

1.5 Comparative Perspective

While global leaders such as the United States, Japan, and South Korea remain ahead in the commercialization of VIs, Russia's efforts demonstrate a unique interplay of technological innovation, creative industries, and cultural adaptation. The Russian market may not yet rival global examples in scale, but its trajectory indicates growing relevance and international competitiveness.

This article explores the phenomenon of virtual influencers (VIs) in interactive advertising. While traditional influencers have become standard carriers for native advertising, virtual influencers act as algorithmically generated media personas, capable of independent content creation and audience engagement. The study examines their role, effectiveness, and the ethical considerations associated with their use in marketing strategies.

Interest in virtual influencers is driven by the evolution of communication practices in both traditional and digital media (Jenkins, 2019). Traditional media relies on proven formats, while the digital environment demands ongoing innovation in content creation and delivery. Digital audiences expect novelty, which drives experimentation with new forms of messaging. This evolution is accelerated by technological advancements, shifts in user behavior, and personalized content consumption patterns.

From Mass Media to Digital Opinion Leaders

Audiences on digital platforms consistently seek innovative communication solutions (Global Intelligence Hub, n.d.). Digital advertising requires a fundamentally different approach, emphasizing continuous creative experimentation, short content lifecycles, and hybridization of formats. Overcoming advertising blindness requires engaging users with personalized, interactive, and adaptive messaging.

Digital media enables multimodal messages combining visual, textual, auditory, and tactile elements. Interactivity allows users to influence content in real time, while adaptability permits instantaneous adjustments based on behavioral feedback. These capabilities support dynamic, user-centered advertising strategies.

Trust in information sources is increasingly shifting from traditional media to digital opinion leaders and influencers (Adindex, 2024; TASS, n.d.). In Russia, 57% of users consider digital influencer content a primary source of information. Personalized media intermediaries are growing in importance as audiences diversify their information sources and develop media literacy that includes cross-referencing content from multiple channels.

From Real Influencers to Virtual Influencers

Key Opinion Leader (KOL) marketing leverages the authority of trusted individuals to deliver targeted messages. Unlike traditional advertising, KOL marketing is mediated through opinion leaders with social capital, enhancing trust and engagement. Historically, celebrities activated selective attention, emotional resonance, and cognitive efficiency among audiences (Sostav, n.d.; Nielsen, 2024).

Digital micro-celebrities and ordinary influencers blur boundaries between professional media figures and regular users (Heydon, 2018). Brands are now creating virtual influencers (VIs) — AI-powered digital personas capable of interacting with audiences across scales, from mega-influencers to nano-influencers.

VIs support the entire customer decision-making cycle, from generating demand to reinforcing brand associations. Research indicates a strong correlation between prolonged VI-audience engagement and marketing effectiveness (Audrezet & Koles, 2023). Regular, systematic interaction fosters cumulative brand perception, while one-off engagements yield limited results. Effective campaigns combine macro- and micro-influencers, synchronize messaging, and use multiple formats while maintaining core brand messages.

AI-Driven Engagement and Interactive Capabilities

Virtual influencers powered by AI can respond to comments, conduct live streams, and personalize interactions based on user behavior. Integrating AI with storytelling and data analytics allows VIs to deliver relevant content, increase engagement, and create emotional connections (Schaffer, n.d.; Feedspot, n.d.). However, overreliance on AI and personalized techniques may cause audience fatigue and raises ethical concerns regarding privacy and subliminal advertising.

VIs merges contextual communication, behavior-based content adaptation, interactive participation, and transmedia storytelling, bridging digital and physical realities. This integration creates strong emotional connections that can influence purchase behavior, brand loyalty, and user engagement.

Conclusion

Virtual influencers represent an innovative, humanized advertising format. They combine multiple digital identities, emotional engagement, and anthropocentric narratives to simulate real human interaction. AI technologies enhance their capabilities, enabling long-term engagement, interactive responses, and cross-platform storytelling. Recommendations for effective VI campaigns include:

1. Establishing long-term audience contact (minimum six months).
2. Implementing regular AI-powered content publishing.
3. Combining macro- and micro-influencers to enhance trust.
4. Employing cross-platform strategies and mixing owned and rented VIs.

Balancing marketing effectiveness with ethical considerations is critical to avoid audience fatigue and privacy violations. Virtual influencers thus represent a new frontier in interactive advertising, blending technology, creativity, and human-centered communication.

Acknowledgement

The authors wish to thank the Russian State University for the Humanities for its institutional and academic support in carrying out this study. Special appreciation is extended to colleagues in the Department of Branding and Visual Communications for their constructive feedback, as well as to professionals in the Russian advertising industry who provided valuable insights during preliminary discussions.

Conflict of Interest

The authors declare that they have no known financial or personal conflicts of interest that could have influenced the research, analysis, or conclusions presented in this paper.

Keywords Public-private partnership contracts, public sector, private sector, concession contract, public service delegation contracts, BOT contract.

Abstract
This study examines the legal aspects of public-private partnership contracts within the Algerian and French legal framework, as a new mechanism for financing, managing, and operating public utilities. It does so by clarifying the conceptual framework of these contracts and their characteristics that distinguish them from other traditional contracts. It also explains their legal nature and objectives, which are based on balancing two basic requirements: ensuring and improving the quality of public service, on the one hand, and achieving economic efficiency by providing funding for the establishment and management of infrastructure projects at the lowest possible costs, on the other hand. It also presents practical models of partnership contracts in both Algerian and French law, and comes up with results and recommendations that enhance confidence in this type of contract to achieve development goals and attract investments.

Introduction:

The economic transformations witnessed in recent years, coupled with the expansion of public services provided by states to their citizens through various public facilities for the common good, have imposed unprecedented financial burdens and challenges that have strained and burdened state budgets. This has rendered states unable to effectively manage, administer, operate, or develop the numerous and diverse public projects and facilities.

On this basis, and in order to ensure public service and improve its quality to ensure greater management effectiveness at the lowest possible costs, countries have tended to reconsider the traditional mechanisms for managing and running public projects and facilities, by adopting new management methods that allow the public sector to cooperate with the private sector to achieve the state's development programs, by involving it and granting it the privilege of financing, building, managing, running, operating, or developing infrastructure projects, with the exception of the state's sovereign facilities, as is the case with the judiciary, security, and defense facilities, within the framework of Public-Private Partnership (PPP) contracts, which are enshrined in Algerian law, similar to what has been adopted by comparative legislation, including French law.

It is worth noting in this context that Public-Private Partnership (PPP) contracts are relatively recent, having first appeared in Britain in 1992 under the name of the Private Finance Initiative (PFI)[1]. France did not adopt this

[1]- Carsten Greve ،Graeme A. Hodge, The Challenge of Public-private Partnerships Learning from International Experience, Edward Elgar Publishing, Incorporated, United Kingdom, 2005, p 99

type of contract within an independent legal framework until 2004, with the issuance of Ordinance No. 2004-559 on partnership contracts. This followed several legal reforms, unifying partnership contracts and integrating them into concession contracts under Ordinance No. 65-2016. This transformation was later fully embodied with the issuance of the French Public Procurement Law of 2018[2]. Meanwhile, the Algerian legislature has enshrined public-private partnership contracts in various legal texts, such as the National Property Law, the Water Law, and the Public Procurement Law, under the title of concession contracts and public utility delegation contracts.

The importance of this study lies in the significant role that Public-Private Partnership (PPP) contracts can play in rebalancing spending and management. This is achieved by controlling and rationalizing public expenditures, while simultaneously ensuring the provision of public services and serving the public interest.

Furthermore, these contracts represent a shift away from the traditional model of managing and operating public facilities. They introduce a new concept of contracting that fosters cooperation and partnership between the public and private sectors in all aspects, including the exchange of expertise, modern technology, and resources. This collaboration ultimately leads to a higher quality, more efficient, and more comprehensive public service, aligning with established development goals.

Based on the above, the problem of this study is as follows: What are the legal provisions and rules governing public-private partnership contracts? What is their legal nature and the impact thereof on the rights and obligations of the parties? And how effective are they in achieving development goals?

To answer this problem, the study relied on the analytical approach, analyzing various legal texts, jurisprudential opinions, and some judicial interpretations related to public-private partnership contracts, in order to determine the provisions and rules regulating this type of contract, starting with its concept and characteristics, then its legal nature, and arriving at its models. We also used the comparative approach, through which we attempted to understand the position of both Algerian and French legislation on public-private partnership contracts, by comparing and contrasting the dimensions and objectives of the legal texts regulating this type of contract in both legal framework, linking and harmonizing them.

Based on the above, we divided this study into two sections. In the first section, we addressed the conceptual framework of public-private partnership contracts and their legal nature. In the second section, we addressed practical models of public-private partnership contracts.

I- The conceptual framework of public-private partnership contracts and their legal nature

The conceptual framework for public-private partnership contracts is of paramount importance, as it serves as the reference that defines the basic elements and features of partnership contracts and clarifies their legal nature. This helps define the rights and obligations of the parties and achieve the stated development goals.

1- The concept of public-private partnership contracts

Defining the concept of public-private partnership contracts requires us to first define what is meant by this type of contract, as well as to clarify its characteristics that distinguish it from other traditional contracts.

A- Definition of public-private partnership contracts

The issue of defining public-private partnership contracts has received considerable attention from jurisprudence, legislation, and international organizations, given their growing prevalence as a strategic option and advanced model for implementing various public projects and achieving economic and social goals. The definitions offered have varied and varied, making it difficult to agree on a comprehensive and unified definition that reflects the complex and evolving nature of these contracts.

[2]- Boeing Laishram ،Ganesh Devkar ،Tharun Dolla, Revisiting Public-Private Partnerships Lessons from COVID-19, Springer International Publishing, Switzerland, 2023, pp. 251-252

Accordingly, defining what is meant by public-private partnership contracts requires us to address the definition of these contracts in jurisprudence, then legislation, as well as the definitions set by international bodies, in accordance with the details explained below.

A-1 The jurisprudential definition of public-private partnership contracts

Jurisprudence has differed regarding the definition of public-private partnerships (PPP), depending on the perspective and angle from which they are viewed, whether from a formal, organic, or administrative perspective, or from a functional, economic, social, or legal perspective[3]. Some jurisprudence defines PPPs as "the latest form of cooperation between the public and private sectors, through which public services are provided to citizens through a long-term contractual relationship. Risks, roles, and responsibilities are distributed among the two partners, representing these sectors, according to the superior capabilities and expertise of each, within a framework of achieving the public interest"[4]. This definition appears to focus on the fundamental principles of PPP, identifying the primary objective of the partnership as providing public services and achieving the public interest, as well as the roles, responsibilities, and benefits that this contractual relationship creates. However, it is criticized for neglecting one of the most important elements of partnership: financing, which is the primary motivation for concluding this type of contract. Furthermore, it does not generally address the forms of PPP.

While other jurisprudence defines it as "contracts provided by the private sector as public services on behalf of and under the supervision of public authorities"[5]. This definition appears to be so brief and simplistic that it overlooks many of the fundamental aspects of partnership, focusing solely on the role of the private sector as the provider of public services through agency within the framework of this legal relationship, and the role of the public sector as a public authority in oversight, thus highlighting the traditional shift in roles, without highlighting the fundamental elements of this partnership, such as the time element, the financing element, and the risk distribution element.

In more detail, another branch of jurisprudence defines public-private partnership contracts as "an administrative contract whereby a public legal entity entrusts a private sector entity with financing the investment related to the necessary works and equipment of the public facility, as well as its management, independence, and maintenance throughout the specified contract term, in exchange for sums of money that the contracting authority undertakes to pay to the entity in installments throughout the contract period. Institutions from the public and private sectors work together to implement projects or provide services to citizens, particularly in infrastructure projects"[6]. This definition is clearly more comprehensive than its predecessors, encompassing all aspects of public-private partnerships, However, it would have been more precise and clear to explicitly highlight the financing element.

A-2 - Legislative definition of public-private partnership contracts

Most national legislations have been keen to allocate a specific definition for public-private partnership contracts. We mention among these the French legislator, who has tended to define them under Article 1, Paragraph 01 of

[3]- Jurisprudence acknowledges the difficulty of reaching consensus on the precise meaning of public-private partnerships. Some scholars have even dismissed the concept as futile, arguing that it has no established definition and that it is extremely difficult to examine the origin of this obscure English word. See:
Zhongju Meng ،Xiaohong Dang ،Yong Gao, Public Private Partnership for Desertification Control in Inner Mongolia, Springer Nature Singapore, Singapore, 2019, p 05

[4]- Muhammad Muhammad Abu Saree Ali, The Role of Public-Private Partnerships in Providing Public Services, Egyptian Publishing and Distribution, Egypt, 2020, p. 38

[5]- Haitham Abdullah Dheeb, Fundamentals of Strategic Planning, Al-Yazouri Scientific House, Jordan, 2017, p. 120

[6]- Haitham Abdullah Dheeb, Fundamentals of Strategic Planning, Al-Yazouri Scientific House, Jordan, 2017, p. 120

Ordinance No. 2004-559, as amended and supplemented, regarding partnership contracts[7], as follows: (A partnership contract is an administrative contract by which the State or a public institution of the State entrusts a third party, for a period determined by the amortization period of the investments or the financing methods chosen, with a global mission for the construction or transformation, upkeep, maintenance, operation, or management of works, equipment, or intangible assets necessary for the public service, as well as all or part of their financing, with the exception of any equity participation.

It may also cover all or part of the design of these works, equipment, or intangible assets, as well as the provision of services contributing to the exercise, by the public entity, of the public service mission for which it is responsible.)

Unlike the situation with the Algerian legislator, which has not defined what is meant by public-private partnership contracts, given the lack of a unified and comprehensive law regulating such types of contracts in Algeria, this does not mean that the Algerian legislator does not recognize this type of contract. Rather, it has regulated certain types of them under separate legal texts, such as Presidential Decree No. 15-247 regulating public procurement and public service delegations[8], as well as Executive Decree No. 18-199 of August 2, 2018, relating to the delegation of public services. This requires the Algerian legislator to intervene in a comprehensive legal framework that includes a precise definition of public-private partnership contracts, keeping pace with the rapid development and growing interest in these contracts.

A-3 - Definitions of Public-Private Partnership Contracts by International Bodies

As part of the tireless efforts made by international bodies to standardize and regulate the concept of public-private partnership contracts at the international level, the Organization for Economic Co-operation and Development (OECD) has defined these contracts as: (An agreement between the government and one or more private partners « which may include the operators and the financers » according to which the private partners deliver the service in such a manner that the service delivery objectives of the government are aligned with the profit objectives of the private partners and where the effectiveness of the alignment depends on a sufficient transfer of risk to the private partners)[9].

The World Bank also paid great attention to public-private partnership contracts, defining them as: (A long-term contract between a private party and a government agency for providing a public asset or service, in which the private party bears significant risk and management responsibility)[10].

For its part, the European Commission defined public-private partnership contracts as: (refers to forms of cooperation between public authorities and the world of business which aim to ensure the funding, construction, renovation, management or maintenance of an infrastructure or the provision of a service)[11].

In turn, the United Nations defined public-private partnership contracts as: (a cooperative arrangement between public sector authorities "such as governments or governmental agencies" and private sector companies or

entities. These partnerships are typically established for delivering and managing public services or infrastructure projects, where both parties contribute resources and share risks, responsibilities, and rewards)[12].

In general, what can be concluded from the previous definitions is that defining what is meant by contracts requires that it includes a set of basic elements, especially in terms of the necessity of identifying the parties to the partnership, represented by both the public and private sectors, as well as defining the primary objective of the partnership, which is to provide public services and achieve the public interest, in addition to the roles, responsibilities and advantages that this contractual relationship creates, such as the element of risk distribution, the element of financing, and the time element.

B- Characteristics of public-private partnership contracts

Public-private partnership contracts have a set of unique characteristics that distinguish them from other traditional contracts concluded by the state or one of its public administrations, which are as follows:

B-1 -Multiple contracting parties between the public and private sectors

Public-private partnership contracts are characterised by the multiplicity of parties involved in their implementation, as they bring together two parties: one of them is a public legal entity, represented by the state or one of its public administrations, and a private legal entity, whether national or foreign.

The public sector here refers to all the institutions and bodies affiliated with the state[13], which seek to provide public services as a primary objective and not to make a profit. According to Article 49 of the Algerian Civil Code[14], and Article 1 of the French General Law on the Property of Public Persons[15], this includes the state, regional groups, and public institutions of an administrative nature. The private sector includes persons subject to private law, such as civil and commercial companies and institutions.

Undoubtedly, the multiplicity of parties as previously explained presupposes a conflict of interest among them. The public sector, as a general principle, aims to provide public services and achieve the public interest, while the private sector's primary goal is to generate profit. This makes public-private partnership contracts an effective means of reconciling these conflicting interests. This is achieved by improving the level and quality of services provided to individuals at the lowest possible costs, thus alleviating the financial burdens on the public sector, on the one hand, by involving the private sector in financing project implementation, and contributing to improving the economic efficiency of the private sector by ensuring profit and distributing risks and responsibilities within the framework of this contractual relationship based on partnership[16].

B-2 -The multiple stages of public-private partnership contracts and their complex nature

Public-private partnerships are characterized by multiple stages. They begin with the preparation and design phase, during which the project's needs are identified and feasibility studies are conducted. This is followed by the selection phase, where the partner is selected based on specific criteria and conditions, following a call for proposals and evaluation. This is followed by the implementation and operation phase, during which the private partner assumes responsibility for the design, construction, financing, operation, and maintenance of the project. The public entity oversees and monitors the private partner's compliance with the terms of the PPP contract. The

[16]- Al-Naimi Abu Bakr, Ahmed Othman, Modern Methods of Private Sector Participation in the Implementation of Infrastructure Facilities, A Comparative Analytical Study, Dar Al-Hamed for Publishing and Distribution, Jordan, 2012, p. 29

ownership transfer phase concludes with the end of the agreed-upon term, during which the project is handed over and its ownership transferred to the public sector[17]. The importance of this feature lies in its ability to effectively guarantee the sustainable implementation of projects, as these multiple, sequential phases contribute to establishing a fair and transparent partnership relationship, enhancing the protection of public funds and the long-term effectiveness of the project.

As a result of the multi-stage feature, public-private partnership contracts are characterized by a long duration, as each of the stages mentioned above requires a specific period of time to complete. Instead of each stage being concluded under a separate contract, these stages are combined into one long-term contract, which makes partnership contracts long-term contracts, extending for a period of time ranging from 20 to 30 years[18].

B-3 - Risk distribution

Public-private partnerships are based on the principle of risk sharing between the contracting parties, unlike other traditional contract models concluded by the public sector, where the majority of the risk falls on the public sector. This principle is based on the idea of creating an integrated mechanism to ensure contractual balance and achieve harmony between the conflicting interests of the contracting parties. Each party bears responsibility for project-related risks that it can manage, such as risks arising from delayed implementation and the excess of actual costs over estimated project costs.

However, risk sharing does not necessarily mean distributing them equally, but rather means that each party bears the risks that it is able to manage, provided that these risks are determined and distributed within the framework of the terms of the partnership contract, which is what the French legislator stipulated in Article 11 of Ordinance No. 2004-559, as amended and supplemented, which emphasized that the partnership agreement must include clauses related to the conditions for risk sharing between the public sector and the participating contractor[19]. Such as the private sector bearing the risks of construction, erection and operation, in exchange for the public sector bearing the regulatory, legal and political risks, or an agreement to share the risks related to the market, demand or force majeure[20]. In general, it is recommended that, regarding the distribution of risks in public-private partnership contracts, the public sector bear the external risks of the project, in exchange for the private sector bearing the risks related to the project, and that other remaining risks, which neither partner can control, be shared[21].

As a result, the failure to define responsibilities in the terms of public-private partnership contracts, or their poor distribution or mismanagement, makes these partnerships a source of many disputes, which may disrupt project implementation and hasten its failure.

B-4 - Multiple areas of application of public-private partnership contracts

Public-private partnerships are flexible enough to accommodate various vital fields and sectors, encompassing a wide range of applications. This reflects the growing interest of countries in using PPPs as a strategic option for providing public services and achieving public interest in various infrastructure projects. According to the

Organization for Economic Cooperation and Development (OECD)[22] and the Asian Development Bank (ADB)[23], PPPs focus on transportation infrastructure projects, including highways, airports, ports, railways, bridges, tunnels, and other infrastructure facilities that provide public services. This also applies to water and sanitation facilities, power generation plants, fuel, educational, healthcare, entertainment and sports facilities, and parking lots.

It is concluded according to multiple application models, such as the build-operate-transfer (BOT) model, the build-own-operate (BOO) model, the design-build-finance-operate (DBFO) model, the design-build-finance-maintenance (DBFM) model, and the design-build-finance-maintenance-operate (DBMFO) model[24].

2- Legal adaptation of public-private partnership contracts

Public-private partnership contracts raise a fundamental legal problem, namely determining their nature and legal classification. This issue is of paramount importance, as it forms the basis for determining the legal framework regulating public-private partnership contracts, from the conclusion stage to the implementation stage and any disputes that may arise therefrom. This then clarifies the legal positions of the parties involved, particularly in terms of determining the applicable law, describing mutual contractual rights and obligations, and appointing the competent judicial authority to adjudicate disputes arising therefrom.

This issue has sparked widespread juristic debate, between those who consider public-private partnership contracts to be administrative contracts, those who consider them to be private contracts, and those who see them as having a special nature. This is what we will attempt to highlight in some detail in the following points.

A- Public-private partnership contracts are administrative contracts

Some jurisprudence[25] considers public-private partnership contracts to be administrative contracts. This is the approach adopted by the French legislator, who explicitly stipulated that "the partnership contract is an administrative contract..." in his definition of partnership contracts under Article 1, Paragraph 01 of Ordinance No. 2004-559, as amended and supplemented, relating to partnership contracts. The Algerian legislator also adopted this approach by classifying the public service delegation agreement as an administrative contract under Article 06 of Executive Decree No. 18-199 relating to the delegation of public services[26], which is originally one of the applied models for public-private partnership contracts in Algeria.

An administrative contract is defined as (a contract concluded by a legal entity under public law for the purpose of managing a public facility or in connection with its operation, and which demonstrates its intention to adopt the public law method by including in the contract an exceptional condition or conditions unusual in private law, or by authorizing the contracting party with the administration to directly participate in the management of the

public facility)[27]. It is understood from this that for a contract to be administrative, it must be connected to the implementation of a public facility and contain exceptional conditions unusual in private law; otherwise, the contract is considered a private law contract, which the administrative judiciary is not competent to consider and adjudicate[28].

These are the arguments and justifications on which the proponents of this view relied when they argued that public-private partnership contracts are administrative contracts. This is because one party to the partnership contract is a public entity, represented by the state, regional groups, or public institutions of an administrative nature. The subject of the contract is related to a public facility, whereby a public entity entrusts a private entity with financing the investment related to the necessary works and equipment for the public facility, as well as managing, operating, and maintaining them. It also includes exceptional, unusual conditions, such as the public entity's right to amend the contract unilaterally in accordance with the public interest, without requiring the approval of the second party to the contract, represented by a private entity. This departs from the principle that the contract is the law of the contracting parties established in private-law contracts. There are also other advantages whereby the public entity relinquishes some of the privileges of public authority to the private entity, enabling the latter to achieve the objectives of the partnership, such as tax concessions and customs duties. If a company contract lacks one of these elements, the contract is considered a private, not an administrative, contract.

B- Public-private partnerships are private contracts

Another trend in jurisprudence[29] holds that public-private partnership contracts are considered private contracts, subject to the rules of civil and commercial law, and that jurisdiction over disputes arising from them lies with ordinary courts, not administrative ones.

The argument of the proponents of this view is that this type of contract is subject to the principle of the sovereignty of the will and the principle that the contract is the law of the contracting parties, which is regulated by the rules of private law. The exceptional and unusual conditions that distinguish administrative contracts from private contracts are absent, given that in partnership contracts between the public and private sectors, the terms and conditions of the contract are negotiated between the two parties in advance, and based on that, risks, responsibilities and profits are distributed. This is inconsistent with the unilateral authority enjoyed by the public person in the field of administrative contracts, which makes the administration's authority to amend the

partnership contract by its unilateral will or impose penalties, an idea that is unlikely to be applied in the field of partnership contracts between the public and private sectors.

The objective of concluding public-private partnership contracts differs from the primary objective of concluding administrative contracts, which is limited to the idea of achieving the public interest. This is in contrast to the situation with partnership contracts, which are based on the idea of achieving profit for the benefit of the private sector. The provision of public services and the achievement of the public interest are linked to a guaranteed financial reward and return for the benefit of the private sector under the partnership contract. This makes them private contracts rather than administrative contracts.

In addition, the nature of public-private partnership projects is linked to economic and commercial dimensions, which requires them to be subject to the rules of private law in order to ensure their effectiveness and encourage and attract investment and investor confidence.

C- Public-private partnership contracts are a special nature

A section of jurisprudence[30] has adopted a modern approach that removes partnership contracts from the traditional legal classifications that classify the latter as administrative contracts or private contracts. This jurisprudential trend sees partnership contracts between the public and private sectors as having a special nature, due to their enjoyment of distinctive characteristics that combine within them elements of administrative contracts and private contracts. This makes it difficult to classify these contracts as administrative contracts or private contracts in advance. Rather, to determine their legal nature, each contract must be considered separately. In this case, partnership contracts between the public and private sectors are considered administrative contracts when their elements and pillars are present, and they are considered private contracts when their terms and conditions are present.

The argument of those who hold this view is that public-private partnership contracts are modern contracts that include a set of contractual elements of a special nature that go beyond and are distinct from those elements found in traditional contracts, due to their flexibility, which enables them to adapt to the various stages of the project, such as the element of ownership of the land or facility on which the project is built, the element of revenues and fees, the method of which is stipulated in the contract for sharing and determining them, and the element of risks and responsibilities distributed between the two parties to the contract from the public and private sectors, which can change according to each stage of the project, in addition to the element of financing and the duration of the contract, through which the source of financing for the project and the duration of the contract are determined. All of these elements differ from one contract to another according to the objectives that the will of the parties seeks to achieve, which makes it difficult, as it was, to establish a general classification that applies to all types of partnership contracts. This leads to the necessity of determining the legal nature of each contract separately, according to its elements and the circumstances surrounding it, which ensures that the legal classification of each public-private partnership contract is consistent with the content and reality of the contract[31].

In light of these jurisprudential tensions, the researcher favors the first opinion, which classifies public-private partnership contracts as administrative contracts, given that the second and third jurisprudential opinions, which

[31]- Yousef Saadoun Muhammad Al-Maamouri, The Legal Regulation of Maintenance Contracts in Infrastructure Projects, A Comparative Study, Arab Center for Publishing and Distribution, Egypt, 2020, pp. 115-116

advocate the civil and private nature of partnership contracts, have endeavored to adapt them in the absence of a legal framework that regulates and governs this type of contract. However, in light of the successive issuance of legal texts, this issue has become almost settled, as we saw in the first opinion mentioned above, as national legislation in both Algeria and France, for example, tends to classify them as administrative contracts.

II- Practical models for public-private partnership contracts

There are various models for public-private partnership contracts depending on the nature and requirements of the project, including financing, construction, operation, and maintenance phases. Perhaps the most prominent models established by Algerian and French legislators are build-operate-transfer (BOT) contracts, in addition to public utility concession contracts.

1- Build-Operate-Transfer (BOT) contracts

Build-operate-transfer (BOT) contracts derive their legal basis in Algerian law from several legal texts. The Algerian legislator has implicitly recognized this type of contract without explicitly using the term "BOT." This can be inferred from Article 17 of the 2005 Water Law[32], which subjects artificial public water properties to this type of contract, specifying all the stages of a BOT contract: construction, operation, and transfer of ownership. This can also be inferred from Article 64 bis of the 1990 National Property Law, as amended and supplemented[33], which uses the term "concession grant" to refer to a BOT contract, given that the concept and meaning of granting a concession to use national property includes construction, operation, and transfer of ownership.

This is the same legal situation prevailing in French legislation, whose legal texts do not recognize a specific term called Build, Operate, and Transfer (BOT) contracts. However, its components, namely Build, Operate, and Transfer (BOT), have been regulated within the legal framework governing concession contracts, which is governed by the French Public Procurement Law.

However, to elaborate on the provisions and rules governing build-operate-transfer contracts, we must first define this type of contract, and then address its forms, as explained below.

A- Definition of Build-Operate-Transfer contracts

Returning to the entirety of the legal texts regulating this type of contract in Algerian law, we can hardly find a legal definition for build-operate-transfer contracts. This position is consistent with the orientation of other comparative legislation, such as French legislation, which did not provide a single definition for them. This is primarily due to the lack of a specific and detailed legal framework regulating this type of contract, with the exception of some scattered legal texts that focused on the procedural aspect rather than the conceptual one.

Leaving the field to international bodies and jurisprudence, which provided several definitions of build-operate-transfer contracts, as the United Nations Model Law Commission (UNCITRAL) defined it as: (form of project financing where a government grants a concession for a period of time to a private consortium (hereafter referred to as the "project company") for the development of a project; the project company then builds, operates and manages the project for a number of years, recoups the construction costs and derives its profit from the

[32] Law No. 05-12 of August 4, 2005, relating to water, published in the official journal of the Algerian Republic, No. 60, issued on August 28, 2005

[33]- Law No. 90-30 of December 1, 1990, containing the National Property Code, published in the official journal of the Algerian Republic, No. 53, issued on December 5, 1990, amended and supplemented by Law No. 08-14, dated July 20, 2008, official journal, No. 44, issued on July 27, 2008

proceeds generated by the operation and commercial exploitation of the project. At the end of the concession period, the project is transferred to the government)[34].

On the other hand, the jurisprudence side has defined build-operate-transfer contracts as (those projects that the government entrusts to a company, whether national or foreign, whether a public or private sector company, and is called a project company to establish a public facility and operate it on its behalf for a period of time, then its ownership is transferred to the state or the administrative authority)[35].

Others in jurisprudence defined it as (a contractual process through which a number of private companies come together under the name of the project company, which undertakes the financing, construction and operation of a public facility granted by the state for a specific period, on the condition that the project company is obligated to return the project to the party granting the obligation at the end of the contract period)[36].

Another aspect of jurisprudence defined it as: (Type of project delivery framework in which a private entity designs, finances, builds, and operates a facility for a specified period. After the operational period, the facility is transferred back to the public sector or the project sponsor)[37].

The above definitions appear to be precise and clear, as they accurately identify the parties to the contract, the purpose of establishing the project, its duration, and its final outcome, which is the transfer of ownership. Furthermore, they address all the main stages of a BOT contract, namely construction, operation, and transfer of ownership. However, what is flawed about them is their failure to address the potential risk element that can arise from BOT contracts, such as the risks associated with construction or operation. They also do not clarify the details related to the company's recovery of its profits in exchange for operating the public facility.

There are some scholars of jurisprudence who define build-operate-transfer contracts as: (an agreement between two parties, one of whom is the owner of the property and the other is responsible for establishing a project on it, in exchange for owning it for his benefit for a specified period)[38]. What can be noted through this definition is its extreme simplicity and its reduction of BOT contracts to two basic ideas: the first is the establishment of the project, and the second is the benefits of the project. As a result, it neglects the basic elements upon which the contract is based, particularly the element of project financing, the element of transferring ownership of the project at its end, and the element of risks associated with establishing the project.

Based on the above definitions of build-operate-transfer (BOT) contracts, what we can conclude is that defining what is meant by this type of contract requires encompassing all the basic elements upon which the contract is based, particularly in terms of identifying the parties to the contract, the purpose of establishing the project, its duration, the potential risks that may arise from it, and the financial details. In addition, it must encompass all of its main stages, namely construction, operation, and transfer of ownership.

B- Forms of build-operate-transfer contracts

The development and practical application of build-operate-transfer contracts have led to the emergence of numerous new forms derived from the original model, each with its own unique characteristics that distinguish it from others. It is necessary to be familiar with these forms in order to choose the form that best suits the

requirements of the project to be implemented and achieve its objectives efficiently and effectively, according to the following details:

B-1 - Build, Own, Operate, and Transfer (B.O.O.T) Contract

It is a contract whereby the state grants a private sector company the concession to build a project, establish its structures and equipment, manage it, and operate it throughout the duration of the contract at its own expense, in return for obtaining the agreed-upon profits from the revenues of fees paid by users of the facility, with the right of the company holding the concession to own the project throughout the duration of the contract; provided that its ownership is transferred at the end of the contract period to the state granting the concession[39].

This B.O.O.T contract differs from the Build, Operate, and Transfer (B.O.T) contract in that it allows the project company to own the project during the contract period, provided that it is transferred to the state at the end of this period. Whereas in B.O.T contracts, the state or one of its public entities is the owner of the project from its beginning until its end, since in this type of contract the project is established in the name and on behalf of the public entity.

B-2 - Build, Own, Operate (B.O.O) contract

It is a contract by which the state undertakes to an investor to establish, establish, operate and own a project, allowing the project company to fully and permanently exploit the facility. The ownership of the project is transferred to the company pursuant to this contract after its construction and erection, and it proceeds to operate it on that basis, without this being linked to a specific time period, and without the company having any obligation to subsequently transfer ownership of the project to the state.

Accordingly, the B.O.O. contract differs from the previous B.O.T. and B.O.O.T. contracts in that the ownership of the project does not transfer to the state after the expiration of the contract term. Rather, the project company retains ownership and manages it indefinitely. On this basis, this type of contract can be considered a form of complete privatization of the public facility, which makes it rarely used, as most countries are reluctant to conclude it, especially in the sector of constructing major public facilities[40].

B-3 - Build, Rent, and Transfer (B.R.T) Contract

It is a contract by which the state pledges to an investor to build and establish a project or facility at his own expense, operate it, and lease it to others during the term of the contract, enabling him to cover the costs of the project and achieve a percentage of the profits from the rental value, provided that he is committed at the end of the contract to transfer ownership of the project to the state[41].

B-4 - Build, Own, Lease and Transfer (B.O.L.T) Contract

It is a contract whereby the state allows an investor to build a project and lease it to a third party to operate it for the duration of the contract, provided that the investor is committed at the end of the concession period to transfer ownership of the project to the state granting the concession[42].

Based on the above, we conclude that both the Build-Own-Lease-Transfer (BOLT) and the Build-Rent-Lease-Transfer (B.R.T) contracts share the same cost-recovery element, whereby a percentage of the profits are realized from the rental fees paid by the project operators, pursuant to the lease agreement concluded between the project company and third parties, rather than being recovered from the total fees paid by the users of the facility, as is

the case with other forms of BOT contracts. However, they differ in the ownership element, which allows the company temporary ownership of the project in the B.O.L.T. contract, while the B.O.L.T. contract grants the company the right to lease or use the property without ownership.

B-5 - Build, Transfer, Operate (B.T.O) Contract

It is a contract whereby the state pledges to an investor to build a project and transfer its ownership to the state upon completion of construction as a first phase. The state then concludes a second agreement with the investor as a second phase to operate and exploit the project during the contract period, in exchange for an agreed-upon percentage of profits that covers construction costs[43].

What distinguishes this type of contract from others is that the state becomes the owner of the project from the outset, not at the end of the concession period. Thus, the state owns the project throughout all its phases, since the project in the Build, Transfer, Operate (B.T.O.) contract is established on behalf of the state.

B-6 - Modernization, Ownership, Operation, and Transfer (M.O.O.T) Contract

It is a contract by which the state pledges to one of the investors to modernize one of the existing projects, in a way that makes the facility capable of efficiency, by providing it with the latest technological equipment and modern management and operation framework, as well as owning and operating it during the term of the contract, provided that ownership of the project is transferred to the state at the end of the concession[44].

B-7 -Design, Build, Finance and Operate (D.B.F.O) Contract

It is a contract by which the state pledges to an investor to build a project and finance it at his own expense, and to manage and operate it with machinery, equipment and devices, in accordance with the technical conditions, designs and controls specified by the state[45].

B-8 -Lease, Renew, Operate, and Transfer (L.R.O.T) Contract

This is a contract whereby the state leases an existing project to an investor to renovate, maintain, and operate it for a specific period of time, charging fees for the service provided. At the end of the contract, the investor undertakes to transfer ownership of the project to the state[46].

2- Public utility concession contracts

Public utility concession contracts are one of the most prominent and important forms of public-private cooperation, and the most widely used. They are regulated by Algerian law under Presidential Decree No. 15-247 and Executive Decree No. 18-199, and by French law under the French Public Procurement Law of 2018. Accordingly, in this section, we will attempt to define what is meant by this type of contract and then explain its forms.

A- Definition of public utility delegation contracts

The general principle is that the task of defining terms is not at the core of the legislator's priorities, as much as the organizational aspects, as this task is usually left to jurisprudence and the judiciary. However, in the field of contracts for the delegation of public services, we find that the legislator has broken this rule, given the

[43]- Volker Birken, BOT-Models as Instrument for Strategic Competitive Advantages in the Automotive Industry, Diplom.de, Germany, 2004, p 30
[44]- Hassan Al-Bannan, The Principle of the Susceptibility of Public Utilities Rules to Change and Development: A Comparative Study, National Center for Legal Publications, First Edition, Egypt, 2014, p. 209
[45]- Jihad Zuhair Deeb Al-Harazino, op.cit, p. 53
[46]- Adrian J. Smith, Privatized Infrastructure, The Role of Government, Thomas Telford, United Kingdom, 1999, p 74

importance of the contract itself on the one hand, and its novelty as a new method of management and administrative contracting on the other hand.

These are the foundations upon which the French legislator relied, as he defined the public service delegation contract through Article 38 of Law No. 93-122, which was repealed[47], stating that: "A public service delegation is a contract by which a legal entity governed by public law entrusts the management of a public service for which it is responsible to a public or private delegate, whose remuneration is substantially linked to the results of the operation of the service. The delegate may be responsible for constructing works or acquiring goods necessary for the service".

However, amid legislative developments in French laws regulating this type of contract, Order No. 65-2016 changed the term "public utility concession contracts" to "concession contracts," in compliance with the 2014 European Union Directive on Concession Contracts, as part of efforts to standardize terminology and legal rules across the European Union.

The evidence for this is what is stated in Article 1411-1 of the French General Law of Regional Communities[48], which states: (A public service delegation is a concession contract within the meaning of Ordinance No. 2016-65 of 29 January 2016 relating to concession contracts, concluded in writing, by which a delegating authority entrusts the management of a public service to one or more economic operators, to whom a risk linked to the operation of the service is transferred, in return either for the right to operate the service which is the subject of the contract, or for this right accompanied by a price).

Based on this new approach, the French legislator, in its definition of the public utility concession contract pursuant to Article 5 of the repealed Ordinance No. 65-2016[49], stated that: (Concession contracts are contracts concluded in writing, by which one or more granting authorities subject to this ordinance entrust the execution of works or the management of a service to one or more economic operators, to whom a risk linked to the operation of the work or service is transferred, in return either for the right to operate the work or service which is the subject of the contract, or for this right accompanied by a price).

This change was finally confirmed with the issuance of the French Public Procurement Law of 2018[50], which combined public utility concession contracts under the term “concession contract,” defining it under Article 1121-1 as: (A concession contract is a contract by which one or more granting authorities subject to this code entrust the execution of works or the management of a service to one or more economic operators, to whom a risk linked to the operation of the work or service is transferred, in return either for the right to operate the work or service which is the subject of the contract, or for this right accompanied by a price)

As for the Algerian legislator, he did not provide a definition for public service delegation contracts within the texts of Presidential Decree 15-247, but he referred regarding his definition to the texts of Executive Decree No. 18-199, which stipulated in Article Two that (the delegation of public service, in the concept of this decree, means transferring some non-sovereign tasks of the public authorities, for a specific period, to the delegate, with the aim of the public interest).

By carefully reading the definitions above, we can clearly see the difference between the definition provided by the French and Algerian legislators. The French legislator was more precise and specific in its definition of the

[47]- Law No. 93-122 of 29 January 1993 on the prevention of corruption and transparency in economic life and public procedures, Amended by Law No. 2014-873 of 4 August 2014 - art. 16, Repealed by Ordinance No. 2016-65 of 29 January 2016 - art. 77

[48]- Article L 1411-1 of the General Code of Local Authorities, Consolidated version of April 16, 2018, Amended by Ordinance No. 2016-65 of January 29, 2016 - art. 58

[49]- Ordinance No. 2016-65 of January 29, 2016 relating to concession contracts. Official Journal of the French Republic, No. 0025, January 30, 2016. Repealed by Ordinance No. 2018-1074 of November 26, 2018

[50]- Ordinance No. 2018-1074 of November 26, 2018 containing the legislative part of the public procurement code, JORF No. 0281 of December 5, 2018

public utility concession contract, as it included all the elements upon which the contract is based, such as the duration of the concession, the form of the concession, and the parties to the concession, while emphasizing the criterion of transferring economic risks to the concessionaire, the owner of the concession. This is in contrast to the Algerian legislator, who was content to focus on the form of the public utility concession agreement and its objectives, without specifying the element of transferring economic risks.

By carefully reading the definitions above, we can clearly see the difference between the definition provided by the French and Algerian legislators. The French legislator was more precise and specific in its definition of the public service delegation contract, as it included all the elements upon which the contract is based, such as the duration of the delegation, the form of the delegation, and the parties to the delegation, while emphasizing the criterion of transferring economic risks to the delegatee. This is in contrast to the Algerian legislator, who was content to focus on the form of the public service delegation agreement and its objectives, without specifying the element of transferring economic risks.

However, this does not prevent us from saying that the intervention of the Algerian legislator by setting the provisions applicable to public utility delegation contracts, under Presidential Decree No. 15-247 and Executive Decree No. 18-199, is a real bet and gain for the administrative legal framework in Algeria, given that it includes new provisions, as it stipulates the principles governing the public utility delegation contract, as well as the forms of delegation, and the formulas for concluding the public utility delegation agreement.

B- Forms of public utility delegation contracts

The Algerian legislator, through Article 210 of Presidential Decree No. 15-247 and Article 52 of Executive Decree No. 18-199, has provided several forms that the delegation of a public service may take, taking into account the level of delegation, the risk borne by the delegatee, and the oversight of the delegating authority. The delegation may take the form of a concession, a lease, an incentive agency, or management. The delegation of a public service may also take forms other than those listed above, in accordance with the terms and conditions specified by the regulations.

While these traditional forms are no longer classified as public utility concession contracts under the French Public Procurement Law of 2018, they have been merged as a form of concession contracts into two forms, based on the criterion of transfer of operational risk. The first form is the works concession contract, which primarily aims to:

1° Either the execution, or the design and execution of works listed in a notice annexed to this code;

2° Either the execution, or the design and execution, by any means whatsoever, of a work meeting the requirements set by the contracting authority[51].

The second form is the service concession contract, the purpose of which is: (Management of a service. It may consist of granting the management of a public service. The concessionaire may be responsible for constructing a structure or acquiring goods necessary for the service)[52].

Taking into consideration in this context that a concession contract relating to works and services is considered a concession for works when its main purpose is to carry out works[53].

Returning to the forms of public utility delegation contracts in Algerian legislation, they include:

B-1 Concession

[51]- Article L1121-2 of the 2018 Public Procurement Code
[52]- Article L1121-3 of the 2018 Public Procurement Code
[53]- Article L1121-4 of the 2018 Public Procurement Code

In Algerian law, a concession means the form through which the delegated authority entrusts the concessionaire with either the construction of facilities or the acquisition of property necessary for the establishment of the public facility, or it entrusts him only with the exploitation of the public facility[54].

Accordingly, the public utility concession contract allows the licensee to exploit the public utility in his own name and on his own responsibility, under the supervision of the delegating authority, provided that the licensee finances the construction, acquisition of property, and exploitation of the public utility himself, in exchange for receiving royalties from the users of the public utility.

B-2 Lease Contract

It is the entrusting of the delegated authority to the delegatee to manage and maintain a public facility, in exchange for an annual fee paid to it. The concessionaire then acts on his own behalf and under his own responsibility. The delegating authority itself finances the establishment of the public facility. The concessionaire's wages are paid by collecting fees from users of the public facility.[55].

Hence, the concession differs from the lease in terms of their subject matter. This is based on the fact that in the concession method, the licensee undertakes the tasks of constructing facilities or acquiring property necessary for the establishment of the public facility at their own expense, while in the lease method, these tasks fall upon the delegating authority, such that the lessee (licensee) is solely responsible for the exploitation and provision of the service. They also differ in that in the concession method, financing falls upon the licensee, while in the lease method, the financing burden falls upon the delegating authority itself. They also differ in terms of the commitment period, which we find to be somewhat long in the concession method, such that the maximum concession period ranges within the limits of 30 years, extendable once by an addendum at the request of the delegating authority on the basis of material investments not stipulated in the agreement, provided that the extension period does not exceed a maximum of 4 years, compared to the lease method, whose period does not exceed a maximum of 15 years, extendable once by an addendum at the request of the delegating authority on the basis of material investments not stipulated in the agreement, provided that the extension period does not exceed a maximum of 3 years[56].

B-3 Incentivized Agency Contract

It is that the delegated authority entrusts the delegatee with managing or managing and maintaining the public facility, and the delegatee exploits the public facility on behalf of the delegated authority, which itself finances the establishment of the public facility and maintains its management. The concessionaire's wages are paid directly by the delegating authority through a grant determined as a percentage of the turnover, to which a production bonus and a share of the profits are added, when necessary. The delegating authority, in conjunction with the concessionaire, determines the rates paid by users of the public facility, and the concessionaire collects the rates on behalf of the concerned delegating authority.

Compared to the concession and lease methods, the maximum term of a public utility concession agreement in the form of an incentive agency is set at 10 years, extendable once by an addendum at the request of the delegating authority on the basis of material investments not stipulated in the agreement, provided that the extension period does not exceed a maximum of two years[57].

B-4 Management Contract

[54]- Article 210, Paragraph 1 of Presidential Decree No. 15-247, as well as Article 53, Paragraph 1 of Executive Decree No. 18-199
[55]- Article 210, Paragraph 02 of Presidential Decree 15-247 and Article 54 of Executive Decree No. 18-199
[56]- Article 54, paragraphs 4 and 5 of Executive Decree No. 18-199
[57]- Article 210, Paragraph 03 of Presidential Decree No. 15-247 and Article 55 of Executive Decree No. 18-199

It is that the delegated authority entrusts the delegatee with managing or managing and maintaining the public facility, and the delegatee uses the public facility on behalf of the delegated authority, which itself finances the public facility and maintains its management. The concessionaire's wages are paid directly by the delegating authority through a grant determined as a percentage of the turnover, to which a production bonus is added. The delegating authority determines the rates paid by users of the public facility and retains the profits. In the event of a deficit, the delegating authority compensates the manager, who receives a lump sum fee. The concessionaire collects the rates on behalf of the relevant delegating authority.

In any case, the duration of the delegation agreement in the form of management may not exceed 5 years[58].

Conclusion:

Through our study of the legal framework for public-private partnership contracts, we have reached a number of conclusions that can be summarized in the following points:

- Defining the precise meaning of public-private partnership contracts in light of jurisprudential and legislative positions requires, through a comparison between them, to include a set of basic elements, particularly in terms of the necessity of identifying the parties to the partnership, represented by both the public and private sectors, as well as defining the primary objective of the partnership, represented by providing public services and achieving the public interest, in addition to the roles, responsibilities and advantages created by this contractual relationship, such as the element of risk distribution, the element of financing, and the time element.

- Both Algerian and French legislators have adopted public-private partnership contracts within their legal framework. This allows the public sector to benefit from the expertise of the private sector, particularly with regard to the transfer of modern technology, energies, and resources. This is achieved by granting the private sector the privilege of financing, constructing, managing, operating, or developing basic infrastructure projects.

- The adoption of public-private partnership contracts by the Algerian and French legislators came under different synonymous names, whether in terms of meaning, structure, constituent elements, nature, purpose and objective. While the French legislator combined partnership contracts within concession contracts in the form of works concession contracts and services concession contracts, the Algerian legislator adopted this type of contract under the name of concession contracts and public utility delegation contracts, which requires the legislator to intervene to unify the terminology to avoid any ambiguity or contradiction.

- The feasibility of a public-private partnership (PPP) project hinges on the fulfillment of a set of important elements and principles, most notably the risk element, which should be identified and distributed within the terms of the PPP contract, similar to other elements. This has implications that could impact the rights and obligations of the parties, whether due to failure to identify them, poor distribution, or poor management. This could make this partnership a source of many disputes, which could disrupt the project's implementation and hasten its failure.

- Jurisprudence has found it difficult to settle on a single legal classification for public-private partnership contracts, given their novelty and complex nature, which combines elements of both public and private law. Some classify them as administrative contracts, others as private contracts, and others as special in nature. However, both Algerian and French legislators have settled this issue by classifying public-private partnership contracts as administrative contracts. This makes the practical models of these contracts administrative contracts by law, and administrative disputes are the domain of the administrative judiciary.

- The absence of a comprehensive and unified legal framework regulating public-private partnership contracts in Algeria, which requires the issuance of a special and detailed legal framework for this type of contract, similar to what has been established in comparative state legislation, as is the case with the French legislature.

[58]- Article 210, Paragraph 4 of Presidential Decree No. 15-247, as well as Article 56 of Executive Decree No. 18-199

Abstract
The world is witnessing a widespread digital transformation that has led to an increasing reliance on digital technology in various fields, including public administration and government institutions. Transformation is no longer just an option, but rather a strategic necessity to enhance efficiency and transparency and achieve sustainable development goals. Digital governance represents a new management framework based on exploiting modern technology to organize administrative processes and provide public services electronically, which contributes to improving citizens' lives and increasing their satisfaction with government performance. Our current study aims to shed light on government digitization, its most important principles, the digital technical failures that can occur, and their main causes, concluding with an examination of the administration's responsibility for these digital technical failures.

Introduction:

In the sphere of administration, digitalization has become a pressing need, particularly when it comes to administering public facilities or services. This has been linked to the idea of e-management and e-government, in which citizens get public services via digital platforms and channels. Therefore, when compared to traditional administration, electronic administration marked a significant turning point in terms of the efficient, quick, and transparent services it offers to individuals. However, there may be hazards associated with the digital transformation of government-provided public infrastructure and services that result in harm to citizens for which the state is liable. Stated differently, the administrative obligation incurred in cases of significant and non-serious service errors/flaws is not eliminated by the digitization of public services. Therefore, it is important for both e-service providers and consumers to understand how the legal system handles service faults that result from using public e-services. When determining administrative accountability for damages inflicted on consumers of public e-services, the administrative judiciary makes a distinction between proven error, presumed error, and no error.

Study Problem:

Administrative liability, particularly administrative liability for electronic damages, has evolved toward compensating those harmed by administrative activity, requiring the presence of an element of fault for such liability to be established. The old principle was that the state was not liable for its harmful actions, given its authority and sovereignty, and that its liability was limited to exceptions. However, this changed as a result of the state's transformation from a guardian state to an intervening state in many activities that were previously the exclusive domain of individuals. As a result of the tremendous scientific and technological developments in all fields, and in connection with the state's practice of these activities, harm may be inflicted on individuals and those dealing with it without any fault being attributed to the administrative body. Given the inadequacy of the fault theory, the theory of objective administrative liability emerged, which does not require the element of fault and is satisfied with the two elements of damage and causation. It was therefore necessary to search for a legal basis for this liability, which is based primarily on consideration of the principle of justice and equality before public burdens. Hence, our current study seeks to answer the following question:

What is the legal basis upon which administrative liability for digital technical malfunctions is based?

Study Objectives:

Our current study seeks to achieve the following objectives:

- Understand the concept and principles of digital governance.
- Highlight the causes of digital technical failures.
- Understand the legal basis for management liability for digital technical failures.

Study Methodology:

The current study relies on an analytical approach to understand the concept and principles of digital governance, analyze the causes of digital technical failures, and determine the legal basis for management's liability for digital technical failures.

1. Digital Governance:

1.1. The Concept of Digital Governance:

Digitization is a modern concept that emerged with the emergence of information and communication technology, which resulted in a shift from using traditional methods of transmitting information and knowledge to using numbers to transmit this information and knowledge. The concept of digitization basically refers to taking theoretical information and encoding it into zeros so that computers can store, process and transmit it[1].

Digitization is defined as the social transformation resulting from the massive reliance on digital technologies to obtain, process, and share information. Thus, digitalization depends on the development of Internet access technologies and advanced software[2].

It is also known as the ability of a state and its people to use digital technologies to generate, process, and exchange information. Its concept is also linked to the concept that describes all of the social, economic, and political changes associated with the mass adoption of information and communications technology[3].

[1] Jason Bloomberg, Digitization and Digital Transformation: Confuse Them At Your Peril, 2018, P. 6.

[2] Raul Katz, Koutroumpis Pantelis, Measuring Socio - Economic Digitation A Paradigm Shift, U.S.A, 2012, P. 35.

[3] M Ruiz and Alejandra Soto, National Digital Strategy, National Digital Strategy Coordinator, Mexico, 2013, P. 13.

Accordingly, digital governance can be defined as the public sector's use of information and communications technology, including the Internet, mobile devices, and other tools, to improve and enhance the efficiency and effectiveness of providing information and services to citizens. Digital governance encourages active citizen participation[1].

1.2. The Importance of Digital Governance:

According to the World Bank (2002), the importance of digital governance is manifested in the following elements[2]:

- Simplifying the process of information accumulation for citizens and businesses.
- E-governance enables citizens to gather and access information related to government policies.
- Participation in the decision-making process.
- E-governance promotes democratic values by ensuring citizen participation at all levels in the governance process.
- E-governance automates various services and provides citizens with a surplus of information related to public welfare.
- E-governance ensures accountability and transparency in government transactions and public sector agencies.
- E-governance helps coordinate and monitor the activities of various government agencies.
- Proper implementation of e-governance helps citizens access public services online, thus saving citizens time and money from having to physically visit government offices.
- Adopting an e-governance policy is beneficial for the delivery of public services to citizens.

1.3. Principles of Digital Governance:

In the era of digital transformation, governments around the world are increasingly relying on information and communications technologies to provide more efficient and effective services to citizens. Digital governance is based on a set of fundamental principles that guide the digital transformation process and help achieve government goals. The basic principles of digital governance can be addressed as follows:

1.3.1. Transparency:

Transparency is one of the fundamental principles of digital governance. It refers to the provision of government information in an open and accessible manner to the public. The main goal of transparency is to reduce the gap between the government and citizens by disclosing all information related to government decisions and policies. In the digital age, the government can enhance transparency by using internet platforms and electronic portals to publish information related to government decisions, budgets, and public projects. This information can include details about general budgets, development plans, government policies, licenses, and government contracts. For example, the government can publish periodic reports on government projects, including the challenges they face and proposed solutions, which contributes to making the government process clearer to citizens[3].

Transparency contributes to building trust between the government and citizens. Transparency also contributes to reducing corruption, as it is difficult for officials to hide any information from the public under modern digital

[1] Choa Tang and R. Murga Perumal, The Characteristics and Values of E - Governance and The Role of E - Democracy, International Journal of Humanities and Management Science, Vol. 1, Issue 1, 2013, P. 142.

[2] Aman Singh, E- Governance: Moving Towards Digital Governance, Vidya A Journal of Gujarat University, Vol. 2, Issue 1, January- June 2023, PP. 204- 215.

[3] OECD, The OECD Digital Government Policy Framework: Six dimensions of a Digital Government, OECD Public Governance Policy Papers, No, 02, OECD Publishing Paris, 2020.

systems. In addition, transparency opens the way for citizens to participate effectively in political life, as they can access information related to decisions that affect their lives[1].

Transparency is one of the most important principles of digital governance, as it relies on providing accurate and clear information about digital operations within the institution. Transparency enhances trust between public institutions and citizens, and reduces the chances of corruption and mismanagement. Transparency includes[2]:

- **Data availability:** Providing data and information in an open and easily accessible manner to all relevant parties, including employees, citizens, and stakeholders.
- **Performance reports:** Publish periodic reports that illustrate the performance of digital systems and technology projects, focusing on results and challenges.
- **Clarity in decisions:** Ensuring that decisions related to digital transformation are based on clear and understandable data.

1.3.2. Accountability:

The principle of accountability refers to the commitment of government institutions to provide clear and convincing explanations and answers to citizens about the decisions and actions taken. This principle enhances citizens' ability to hold the government accountable for its performance and actions. Digital governance contributes to enhancing accountability by providing electronic platforms that allow citizens to submit complaints and suggestions[3]. For example, citizens can submit complaints about government services online, and then track the status of the complaint until it is resolved. The government can also provide periodic reports on how public policies are implemented and the overall performance of government institutions. In some cases, technologies such as blockchain can be used to ensure transparency and accountability in government operations, as every government process can be tracked from start to finish[4].

By strengthening accountability, government performance can be improved, as officials are assured that they will be subject to continuous review by citizens. Accountability also contributes to strengthening trust between government and citizens, as citizens feel that the government is accountable for its actions. Accountability is also an effective tool for reducing corruption, as it makes it difficult for officials to evade responsibility. Accountability ensures that digital decisions are based on sound foundations, and that performance is continuously improved. It means holding individuals and teams accountable for the results of their work within the framework of digital operations. Accountability includes[5]:

- **Defining roles and responsibilities:** Clearly defining the roles and responsibilities related to managing technology and digital systems within the organization.
- **Monitoring mechanisms:** Establishing control systems that enable performance monitoring and assessing compliance with established standards and policies.

- **Sanctions and rewards:** Implementing a system of rewards and sanctions based on performance, which encourages adherence to established standards.

1.3.3. Efficiency:

In digital governance, efficiency means using available resources effectively to achieve specific goals while minimizing waste of time and money. Efficiency aims to improve the quality of government services and reduce costs, which contributes to providing better services to citizens. Efficiency can be achieved in public institutions through the implementation of advanced digital systems such as process automation, the use of artificial intelligence technologies, and big data analysis[1]. For example, the efficiency of government service delivery can be improved by creating digital platforms that enable citizens to complete their transactions faster and more accurately, such as submitting government applications or receiving documents. In addition, digital systems contribute to improving the use of human resources by improving recruitment and training processes, which reduces errors and increases the speed of decision-making.

Achieving efficiency leads to improved government performance and reduced costs. When public institutions use resources effectively, they can provide better and faster services to citizens. For example, when applying for licenses, the time required for these procedures can be reduced by digitizing the entire process, reducing the need for staff and increasing the speed of implementation[2].

1.3.4. Justice and Equality:

Justice and equality are fundamental pillars of digital governance, ensuring equal opportunities for all individuals to access and benefit from government services without discrimination. Achieving digital justice requires ensuring equitable access to technology and digital resources for all segments of society, regardless of their economic, social, or geographic backgrounds. Digital transformation should be a tool for promoting equality among citizens, not a factor that exacerbates existing gaps[3].

Providing a fair digital environment includes designing efficient and transparent e-government services that are accessible to all citizens without exception. To achieve this, public institutions must develop policies that ensure the equitable distribution of digital infrastructure, including high-speed internet, technological devices, and interactive digital platforms. Justice here does not only mean equal access, but also extends to ensuring the equal quality of services provided, ensuring no discrimination in the level of service between urban and rural areas or between different groups[4].

Justice in digital government also requires protecting users' rights by ensuring respect for their privacy and the security of their data. This includes establishing strict regulations that protect individuals from digital exploitation and ensure their data is used in a transparent and responsible manner. When citizens trust that their data is protected, they become more willing to use digital services, which enhances the effectiveness of digital transformation and increases their interaction with the government's digital ecosystem. Achieving equality in digital governance also means removing barriers that may prevent some groups from benefiting from digital services. It is

[4] Meena Chary, Social Equity, the Digital Divide and E-Governance: An Analysis of E-Governance Initiatives in India, University of South Florida, USA, 2011, P. 65.

essential that government platforms are easy to use and accessible to everyone, including the elderly and people with disabilities. This can be achieved by designing interactive digital interfaces that rely on assistive technologies such as text-to-speech, or providing options to display content in ways that suit the needs of different users[1].

1.3.5. Innovation and Development:

Innovation and development are essential elements for achieving effective and sustainable digital governance. They contribute to improving the quality of government services, enhancing operational efficiency, and providing smart solutions that meet citizens' changing needs. Innovation in digital governance relies on the use of modern technologies such as artificial intelligence, big data analytics, and the Internet of Things to improve decision-making processes and deliver smoother and more efficient services[2].

Developing digital infrastructure is a priority in this context, as it ensures an advanced environment capable of absorbing and effectively implementing technological innovations. This includes improving communication networks, creating interactive digital platforms, and adopting cloud computing systems that facilitate the exchange of various information, contributing to the provision of interconnected and responsive government services. Innovation in digital governance is not limited to developing technologies, but extends to redesigning administrative policies and procedures in a way that contributes to facilitating operations and improving the user experience. This can be achieved by adopting smart management methods and developing systems that enable citizens to interact with government institutions easily, such as smartphone applications that provide integrated digital government services[3].

Furthermore, investing in human capital is a fundamental pillar of digital governance development, as digital transformation requires qualified personnel capable of managing and continuously developing modern technologies. Therefore, specialized training programs must be provided, and partnerships with universities and research institutions must be strengthened to support innovation and develop technical solutions that meet societal needs. Furthermore, public-private sector collaboration plays a significant role in accelerating digital innovation. Through strategic partnerships, governments can leverage the technical expertise provided by specialized companies, contributing to the development of more efficient and innovative services and enhancing investments in digital infrastructure. Innovation and development are therefore the cornerstone of successful digital governance, enabling the provision of advanced government services, enhancing transparency, and achieving sustainability through adopting an innovation-driven approach. This improves government performance, enhances citizen engagement, and builds an advanced digital society that keeps pace with modern developments[4].

1.3.6. Participation and Cooperation:

Participation plays a fundamental role in strengthening digital democracy, as it allows individuals the opportunity to express their opinions and contribute to the development of public services and policies. Digital governments provide tools such as electronic referendums, suggestion platforms, and virtual dialogues, allowing citizens to interact directly with decision-makers and contribute to improving government performance[5]. Cooperation is a vital element in the success of digital governance, as it relies on the integration of efforts between the public and private

sectors, academic institutions, and civil society. By building strategic partnerships, innovative digital solutions can be developed that meet the changing needs of society, enhance the efficiency of government services, and provide an integrated technical environment that enables the exchange of knowledge and expertise[1].

In addition, international cooperation in the field of digital governance contributes to the exchange of best practices, the promotion of technological development, and the ensuring that digital systems comply with global standards by engaging in international cooperation networks. Governments can improve their digital policies and benefit from global expertise in the fields of cybersecurity, data management, and artificial intelligence. Therefore, activating participation and cooperation has a positive impact on the digital economy, as it allows startups and entrepreneurs to contribute to the development of government services by providing innovative digital solutions. This approach also enhances a competitive environment that contributes to improving the quality of services and creating new job opportunities in the fields of technology and innovation. In addition, participation and cooperation are two essential pillars of the success of digital governance, as they contribute to enhancing interaction between governments and societies, achieving transparency, and improving the services provided by involving everyone in the digital transformation process[2].

1.3.7. Compliance With Laws and Regulations:

Compliance with laws and regulations is a fundamental principle of digital governance, ensuring that public and private institutions adhere to the legal and regulatory standards governing digital operations. This compliance aims to achieve transparency, enhance trust in digital services, and protect the rights of individuals and institutions, contributing to building a safe and sustainable digital environment. Digital compliance requires adherence to legislation related to the protection of personal data, such as privacy laws that ensure that information is not misused or leaked. Compliance also includes cybersecurity regulations that aim to protect digital systems from cyberattacks and potential breaches, thus maintaining the stability of the digital infrastructure and ensuring the continuity of government services[3].

Furthermore, compliance with laws and regulations includes following international and local standards governing areas such as electronic transactions, digital signatures, and artificial intelligence, to ensure integration and compatibility with global digital systems. This commitment contributes to facilitating international cooperation and enhancing investment opportunities in the digital economy by building a clear and stable legal environment. Compliance also requires digital institutions to adopt strict internal policies to ensure continued compliance with legal systems, such as conducting periodic audits, updating security procedures, and providing ongoing training for employees on new digital laws. This contributes to reducing legal risks and enhancing institutions' ability to adapt to technological and legislative changes[4].

Furthermore, compliance enhances citizens' trust in digital services, as users realize that their data and rights are protected by clear and enforceable laws. It also ensures the provision of fair and reliable digital government services, which enhances individual participation in the digital ecosystem and contributes to a successful digital transformation. Compliance with laws and regulations also ensures the legal sustainability of digital technologies, protects the rights of individuals and institutions, and enhances the reliability of digital systems. Through strict

adherence to the legal framework, governments can achieve a safe and orderly digital transformation that enhances economic and social development[1].

1.3.8. Security and Data Protection:

Security and data protection refer to the need to protect personal data and sensitive information collected by public institutions, and to ensure that this data is protected from cyber threats and attacks. Digital governance requires that public institutions follow the best standards to ensure data protection. This is achieved by using advanced encryption technologies and modern security systems to protect personal information. Public institutions must also comply with local and international regulations related to data protection, such as the General Data Protection Regulation (GDPR)[2]. In addition, employees must be trained on how to handle sensitive data and develop strict policies to control access to information. Implementing security standards reduces the risks associated with cyber-attacks and data leaks. It also enhances citizens' confidence in the digital system, as they feel their personal information is well protected. Security and data protection also contribute to enhanced compliance with local and international privacy laws[3].

Cybersecurity is a fundamental pillar of digital governance, aiming to protect data and digital systems from cyber threats. It also ensures business continuity and protects an organization's reputation from damage resulting from cyberattacks. Cybersecurity principles include implementing strict measures to protect personal and sensitive data from breaches or leaks, identifying potential cyber risks and developing proactive plans to address them, and providing employee training programs to raise their awareness of the importance of cybersecurity and how to deal with threats[4].

1.3.9. Sustainability:

Sustainability in digital government means ensuring the long-term sustainability of digital improvements, including the sustainability of technology, financial resources, and human resources. Sustainability is achieved by adopting long-term strategies for developing digital technology in public institutions. This includes ensuring that digital systems are scalable and keep pace with future technological developments. Digital infrastructure must also be sustained through regular hardware and software updates[5]. Additionally, employees must be continuously trained in the use of these technologies to ensure continued efficiency in delivering digital services. Sustainability ensures the continuity of digital improvements in the future, making government services more effective in the long term. Adopting sustainable digital solutions also helps reduce the environmental impact by reducing the need for paper and other physical resources[6].

Sustainability, as a fundamental principle of digital governance in public institutions, ensures that digital operations are effective and aligned with environmental and social objectives through the efficient use of technological resources. Sustainability principles include rationalizing consumption, using energy and technological resources

effectively to reduce waste, developing long-term strategic plans to ensure the continuity of digital operations, and reducing the environmental impact of digital operations through the use of environmentally friendly technologies[1].

2. Digital technical failures:

2.1. Definition of Digital Technical Failures:

Digital technical failures are defined as a failure in information technology systems that causes the system to be inconsistent with the planned reality or unable to perform its intended functions. These failures are the result of gaps between design and reality, poor project management, or the lack of an appropriate technical environment[2]. These failures result in systems being shut down or partially or completely destroyed. Digital technical failures can be classified as[3]:

- **Development defects:** Human errors in design or coding.
- **Material defects:** Equipment malfunctions.
- **Interaction defects:** Problems connecting components or interfaces.
- **Natural defects:** Such as natural disasters.

2.2. Causes of digital technical failures:

There are several reasons for digital technical failures, including:

2.2.1. Inadequate System Requirements Engineering:

Requirements engineering is the process of discovering, documenting, and analyzing the services that a particular system will provide. This process involves systematic research and study of systems, processes, materials, operating environments, user needs, and other elements and materials to determine the needs of the new system[4]. Inadequate system requirements specifications cause 50% of the failures of e-government information systems projects in developing countries. For example, the student information system implemented by the Uganda Management Institute (UMI) failed because it omitted vital features in the finance module. The analyst did not include the requirements for these features in the initial requirements specification document[5].

2.2.2. Inadequate Project Management:

Project management is the application of knowledge, skills, tools and techniques to direct project activities in line with its goals and objectives. Many e-government information systems projects fail due to poor project management. An example of this is the failure of the Electronic National Traffic Information System (E-NaTIS) in South Africa, according to the African Journal of Information and Communication (AJIC), mainly due to poor

[5] Rehema Baguma and Jude Lubega, Factors for success and failure of e-government projects. In ICEGOV'13: Proceedings of the 7th International Conference on Theory and Practice of Electronic Governance, 2013, PP. 194- 197.

project management[1]. Therefore, e-government projects must adopt proven management methodologies, align their objectives with the strategic goals of the organization, and employ their competence to manage them[2].

2.2.3. Missing or Incomplete Features:

An IS project is said to be successful if it is delivered on time and within the specified budget and with the required quality, features, and ease of use that reflect the real needs of the clients or users[3]. In some cases, e-government IS projects are delivered and accepted with vital missing or incomplete features, thus failing to work and achieve the expected results[4]. This practice leads to the total or partial failure of the e-government IS project. For example, the "Gorilla Buddy" project in Uganda, which was implemented to raise awareness and funds to promote gorilla conservation, was implemented without the essential features of selling promotional materials online and befriending gorillas via SMS[5]. Many reasons can lead to the delivery of incomplete projects, including government officials' resignation due to corruption and failure to follow proper procedures[6].

2.2.4. Inadequate Project Planning:

A project plan identifies activities, timelines, resources, risks, constraints, expected deliverables, and baseline information against which the project can be implemented, monitored, and evaluated[7]. Many of the challenges faced by e-government projects can be avoided or mitigated if carefully planned[8]. The e-Revenue Licensing Project in Sri Lanka is considered a successful e-government initiative due to its good planning[9].

2.2.5. Inappropriate Technology Selection:

When selecting technology for a particular project, several factors must be considered, including ease of learning and use, fitness for purpose, ease of integration with existing systems, availability of documentation and support, availability of skills, overall implementation costs, and overall perceived quality and usefulness[10]. Factors such as corruption may influence technology selection, leading to what are commonly known as vendor-led projects. The smart card project in Thailand is an example of the use of inappropriate technology in an e-government initiative[11].

2.2.6. Insufficient Senior Management Support:

[1] Mustafa Afyonluoğlu, Atilla Aydin Sare Gul Sevil, Eda Yüksel and Murat K. Güngör, An E-Government Project Management Approach with E- Transformation Perspective, International Journal of E Business and E Government Studies, Vol. 6, Issue 1, 2014, PP. 21- 33.

[10] Hussein et al, Op, Cit, PP. 613- 627.

[11] Damoah and Akwei, Op, Cit, PP. 32- 59.

Senior managers are expected to closely monitor critical aspects of the project, including ensuring that the project's goals, objectives, vision, and values reflect the organization's values. Senior managers must ensure that the project is managed according to the organization's standards, and that resources are provided in a timely manner. They must also ensure that project risks are adequately identified and mitigated. A systematic project review will ensure that key milestones are completed on time and that project resources are utilized optimally. Finally, senior managers must promote the project to internal and external stakeholders[1].

2.2.7. Integration Failure:

Providing e-government services requires vertical and horizontal integration of e-government systems[2]. Given the difficulty of achieving this, the challenges of e-government integration are classified into four main categories: strategy, technology, policy, and organization[3]. Most government institutions and agencies develop their e-government systems independently of each other, without paying much attention to how other government institutions and agencies interact with them[4]. For example, the integration between the Citizen Assistance Request (CHR) system, designed by the Bangladesh Police to facilitate online incident reporting, and the identification system to verify the identity of applicants failed due to technical and organizational issues. As a result, the police continued to receive applications with fake names and contact addresses[5].

2.2.8. Disadvantages of Procurement and Contracts:

Government agencies outsource most e-government information systems projects to third parties through legally binding contracts[6]. In some cases, they use various forms of public-private partnerships. In both cases, a contract is essential that defines the parties involved, their obligations, the consequences of non-fulfillment, and dispute resolution procedures. The lack of a fair contract can lead to legal problems, which may ultimately lead to the failure of the project[7].

2.2.9. Inadequate Business Process Management (BPM):

Business Process Management (BPM) is an organizational strategy for identifying, modeling, analyzing, measuring, automating, optimizing, and continuously improving core activities in an organization[8]. The overall goal of e-government initiatives is to improve public service delivery and enhance management processes through electronic services. In this case, BPM and e-government are two complementary initiatives that should go hand in hand. Unfortunately, most e-government information systems projects are designed without including BPM as a core

component. Implementing an e-government information system without reengineering processes can lead to undesirable results and ultimately project failure[1].

2.2.10. Inadequate IS Testing:

Information systems testing is a critical phase in the system development life cycle[2]. It aims to verify, validate, detect, and fix system errors. During the verification process, the developed system is examined to assess its compliance with specified requirements. Inadequate system testing results in its inability to meet the expectations and needs of stakeholders, leading to its abandonment[3].

2.2.11. Inadequate Change Management:

E-government projects are transformational projects that tend to alter business processes, service delivery mechanisms, and organizational structure[4]. Successful transformation requires an appropriate change management process. Some e-government projects fail because the organization is unable to make the necessary institutional changes to transition from legacy processes to the new processes enabled by advanced e-government information systems. A practical change management framework must address all aspects of the organization's implementation, including technology, management, operations, legislation, personnel, and organization[5].

2.2.12. Staff and Skills Shortages:

An effective e-government implementation team must possess core skills, including strategic IT skills, information society skills, information management skills, technical skills, project management skills, and communication skills[6]. Most governments in developing countries suffer from a severe shortage of skilled personnel, and the lack of of relevant technical skills within the e-government project team negatively impacts the quality of information systems[7].

2.2.13. Excessive Technical Complexity:

Technical complexity refers to the difficulty of solving a particular problem using the relevant technology[8]. This includes the inability to accurately define information and processing requirements, data communications, and overall system design, setup, and configurations. Lack of thorough technical evaluation is a major cause of complexities and technical problems in e-government information systems projects. Learning from the mistakes of previous projects is critical to reducing risks and failures in new projects[9].

2.2.14. Outdated Technology:

Planning and implementing government systems projects takes a relatively long time, and as a result, some e-government projects are implemented while the associated technologies are obsolete or on the verge of becoming obsolete. Developing countries also suffer from the adoption of outdated technologies when developed countries donate technological equipment and systems[1].

2.2.15. Information Gaps:

A mismatch between what is captured or produced by the system and what is requested by system users can lead to the failure of an e-government information system. Information gaps in an e-government information system occur in three situations: capturing information that is not necessary for processing or reporting; failing to capture essential information needed for processing or reporting; and requesting certain information that may not be available or relevant to certain users or scenarios[2]. For example, the Citizen Assistance Request (CHR) system designed by the Bangladesh Police required a valid signature from the requester to initiate an investigation. However, the inability of citizens to provide digital signatures online rendered the system unusable[3].

2.2.16. Inadequate Infrastructure:

E-government infrastructure includes hardware platforms, software platforms, middleware, data communications equipment, networks, backup devices, disaster recovery devices, and security technologies. These devices and equipment enable the provision of e-government services that are easily accessible to users. In the field of information technology, the performance and effectiveness of infrastructure are measured in terms of reliability, which is its ability to ensure continuity of operation; scalability, which is its ability to accommodate increased loads; and flexibility, which is its ability to accommodate changes that may be required[4].

2.2.17. Political interference:

Governments are run by politicians who influence many aspects of decision-making, leadership, and development initiatives. Politicians influence many government projects, both positively and negatively, through various means, such as appointing project managers, manipulating their scope and outcomes to suit their political interests, and making different decisions[5]. When a digital project is imposed for political purposes or without adequate technical preparation, this leads to unjustified acceleration of the project stages, leading to the project's failure[6].

2.2.18. Inappropriate Organizational Structure:

Government institutions are built to support their core missions. They rely on a hierarchical structure with bureaucratic leadership, close relationships, and strict rules and procedures. The organizational structure is a fundamental element of e-government governance. Poor allocation of responsibilities or lack of coordination among project stakeholders leads to conflicting decisions and delays in resolution. Therefore, institutions

implementing e-government initiatives must make the necessary reforms to accommodate and manage changes in the e-government system[1].

2.2.19. Security Reasons:

which are represented by the management's failure to protect data from internal and external manipulation and fraud, in addition to cybersecurity risks, security breaches, and unauthorized access[2].

3. Foundations of Administrative Responsibility For Digital Technical Malfunctions:

An important development meant to improve efficiency and service delivery is the use of electronic public administration in the management of public facilities. However, there are dangers associated with this shift that could negatively impact beneficiaries, hence a legal framework for state culpability is required. Three main areas are examined in this analysis of the foundation of administrative responsibility in the context of electronic public facilities: strict liability (without error), liability based on proved error, and liability based on presumed error.

3.1. Verified Error:

Verified Conventional administrative liability is predicated on the existence of fault, which is usually demonstrated by an error. This idea applies to circumstances in the field of electronic public administration where the administration's actions—like system failures or data breaches—directly arise from observable errors. For example, the administration may be responsible for damages if a coding error causes a public facility's digital system to process personal data incorrectly, causing harm. This is consistent with the idea that the state bears responsibility for any illegal or irregular official conduct carried out while performing its obligations.

French administrative law provides a seminal illustration of this type of fault-based liability, since the Conseil d'État has repeatedly maintained that a public organization is accountable for "faute de service," or a service error, if a public system malfunctions and harms people[3].

This kind of accountability serves as a legal incentive for public entities to responsibly maintain and improve their information systems in addition to being necessary for redress[4]. Furthermore, under frameworks like the EU General Data Protection Regulation (GDPR), proved mistakes in the management of personal data may potentially result in administrative punishment and civil compensation[5]. Administrative liability for digital mismanagement, therefore, is a contemporary extension of long-standing public law principles under the notion of demonstrated fault, guaranteeing that technology advancement does not evade established norms of accountability.

It is essential to realize that, despite having legal identity, the administration lacks a will separate from its agents. Since public officials are the means by which the administration functions, mistakes made in the performance of

administrative duties are thereby committed by them[1]. Due to this issue, the French Conseil d'État created a crucial legal theory that distinguishes between service fault (faute de service) and personal fault (faute personnelle)[2].

3.1.1. Personal Fault Versus Service Fault:

In civil responsibility, the individual is usually held directly responsible for the fault. But according to administrative law, personal culpability describes actions taken by a public servant that are completely unrelated to their administrative role, such as behavior resulting from personal hostility, willful misbehavior, or actions taken outside the parameters of their job. In these situations, the individual bears responsibility, and the regular civil courts have jurisdiction[3]. On the other hand, even if the act was careless or damaging, misconduct that occurs while carrying out official tasks is considered a service fault. The administrative courts have the authority to consider such claims, and the administration is accountable for these actions. This distinction represents the understanding that although the administration should be held responsible for the actions of its agents, it should not be held liable for actions that are unrelated to public service or that gravely breach the position's duties.

The French administrative courts' jurisprudence, especially the Conseil d'État's rulings, has been a significant source of advice in this area. In the 1911 landmark decision Anguet CE, for example, the court recognized the potential for both forms of guilt to coexist and upheld the administration's liability even in cases where personal fault occurred, provided that the conduct was not completely separated from service. This dual culpability approach, which is becoming more widely recognized in different legal systems throughout the world, makes sure that victims are not left without compensation because of the difficulty of fault classification[4]. In conclusion, the contemporary theory of administrative accountability strikes a compromise between defending the rights of individuals injured by official activities and the protection of the public interest. Administrative law strengthens the rule of law in public administration by achieving both functional responsibility and justice in the distribution of culpability by differentiating between personal and service failures.

Though the distinction between faute personnelle (personal error) and faute de service (service fault) has long been acknowledged by the French administrative justice, it is still theoretically and practically challenging to distinguish between the two. The concept mostly depends on an abstract criterion that is hard to consistently apply in practical settings, despite the fact that its goal is to fairly divide blame between the administration and the public employee. The idea of fault, whether it be personal or service-related, is fundamentally human behavior, and its assessment is subject to a number of overlapping subjective and objective criteria. The difficulty stems from the fact that administrative errors are rarely the consequence of isolated incidents, but rather are frequently the consequence of intricate relationships between the psychological makeup of the employee, the institutional demands of the administrative setting, and more general social and cultural factors[5].

According to academics, a public employee's psychological composition may affect how they behave under pressure, in positions of authority, or within an institutional hierarchy, which can make it difficult to distinguish between an act that is completely personal and one that is ingrained in the workplace[6]. Furthermore, the employment environment—such as workload, administrative restrictions, or ambiguous procedural guidelines—may influence workers to make judgments that are debatably service-related even though they are faulty[7]. The justice and consistency of imposing personal accountability on an official whose actions, although possibly abnormal, were

caused or made worse by systemic flaws are fundamentally called into question by this interaction. The French Conseil d'État's jurisprudence reflects this issue, as the courts have had trouble providing a clear and broadly applicable standard. In certain situations, judges focus on the employee's deliberate actions or the seriousness of their behavior; in other situations, they evaluate whether the act was naturally connected to the discharge of public obligations. This contradiction highlights a conflict between the legal reality that fault is frequently difficult to classify and the doctrinal aim to preserve a distinction for the purposes of assigning liability.

Though analytically helpful, this distinction should not exclude flexible judicial interpretation, according to modern administrative theory, particularly in cases where strict categorization could impede access to justice or equitable recompense[1]. Comparative jurisprudence, which includes developments in Germany and some common law systems, does, in fact, represent a trend toward emphasizing institutional accountability over personal blame, which lessens the severe effects of unduly strict fault distinctions[2].

Nonetheless, when a public official makes a mistake, courts must determine whether the error is personal, resulting from the employee alone, or a service error, for which the administration is accountable[3]. This distinction was established by the French Tribunal des conflits in the Pelletier case of 1873. The court determined that while a personal error made outside the purview of public duties makes the individual employee personally liable, a service error made while performing official duties entails the administration's liability[4]. However, this distinction's application is quite complicated. Being human, error is impacted by a variety of internal and external factors, including one's sociocultural background, work environment, and psychological makeup[5]. Because of this, developing a single standard to differentiate between the two kinds of error is challenging. As a result, the judge considers the particular facts, the circumstances, and the motivations behind the act before making a decision. A number of guiding standards have been proposed by courts and academics to help with this judicial evaluation:

- Misconduct in the official's private time is an example of a personal blunder that is obviously distinct from the job, both psychologically and physically.
- If an error is physically separated from official tasks, such as utilizing government equipment for personal wrongdoing, it is still regarded as personal even if it is mentally related to the job[6].
- If an error is physically separated from official tasks, such as utilizing government equipment for personal wrongdoing, it is still regarded as personal even if it is mentally related to the job[7]. In these situations, courts frequently examine the official's intentions or the gravity of the behavior[8].

Judicial practice has not established a single, abstract legal norm in spite of these conceptual parameters, and each case still depends on the factual matrix and judicial interpretation[9]. The practical fact that the distinction between personal and service fault is hazy and situation-specific is highlighted by this. Therefore, it is possible for a personal error to occur in an electronic public facility if an employee hacks into the site's security system on purpose or with extreme carelessness, causing the site to become completely paralyzed and its services to be suspended until repairs are made. Alternatively, the employee may disclose the confidentiality of personal information or tamper

with it by destroying or altering it, which would also be considered a crime known as illegal access to the automated data processing system.

However, according to the French State Council's approach of combining personal error and facility error, such personal errors do not prevent the administration's responsibility alongside the employee's responsibility by discovering the facility error in the simple failure to supervise the employee and take the necessary measures to prevent the occurrence of damage, or by the employee committing these personal errors while using the facility's means and tools. However, an electronic public facility may be held accountable for what is legally defined as a service error—an error that can be attributed to the management rather than a specific employee. This makes the administration liable under public law and requires it to use public funds to compensate the harmed party. The administrative judiciary, which has established specific criteria for detecting service faults, especially in the context of digitalized public services, has jurisdiction over such instances[1]. The legal doctrine acknowledges a variety of service error types, which are frequently categorized into three primary groups. According to the principles of administrative law of French provenance, each of these groups may carry particular liability implications, and this is becoming more prevalent in comparative public law systems:

- Failing to provide the Required Service:

This type of situation arises when the government does not offer a service that it is required by law to give. One example of such a failure in the context of electronic administration would be the inability to access an online government platform, the unresponsiveness of digital communication systems, or the lack of real-time access to public records that citizens are entitled to get[2]. The administration may be held liable under the laws governing public service liability if this failure harms a person or institution and is the consequence of carelessness, defects in the system's design, or inadequate technical maintenance. In these situations, the administration's systemic failure—which is manifested in its software planning, digital infrastructure, or incapacity to guarantee service continuity—causes the harm rather than a single human actor. This type of culpability is consistent with the more general concepts of objective fault in public administration, particularly in cases where the service is required and the user is harmed as a direct result of inaction. This type of issue highlights how public bodies are increasingly responsible for maintaining technological dependability and guaranteeing continuous access to e- government services, especially in cases when digital platforms take the role of more conventional, physical routes.

This type of administrative error can also occur when the administration declines to carry out a task that it is contractually or legally obligated to complete. In these situations, the administration's omission or abstention that causes harm to people establishes culpability rather than a positive conduct[3]. When an administration is legally required to take action but instead takes a passive or unjustifiable stance, this bad behavior is considered a service error under traditional administrative law. The courts have generally found that, where damage and a causal connection can be proven, failing to take action when it is due constitutes a breach of administrative duty and results in responsibility.

This type of liability is becoming more and more significant in the setting of computerized public administration. It could be demonstrated, for example, by a public servant not processing or transmitting a digital transaction after it has been completed, or by failing to receive a request that has been submitted electronically. In addition to modernizing public engagement, the automation and digitization of public services also entails legal requirements to preserve technological functionality and responsiveness. In the digital sphere, a refusal or failure to act might have the same legal repercussions as an express denial of service under traditional administration, especially when computers are supposed to operate independently or with little assistance from humans[4]. Therefore, the same

[1] Waline, Op, Cit, P. 523.

[2] Cane, Op, Cit, P. 207.

[3] Waline, Op, Cit, P. 524.

[4] Rolland and Jèze, Op, Cit, P. 143.

standards that apply to omissions in traditional administration must also be applied to electronic inaction, such as disregarded submissions, technical dead ends, or unanswered service requests. Therefore, if such inaction causes harm to a citizen and the other components of culpability (damage and causal linkage) are met, the state or administrative authority may be held accountable.

- Poor Public Service Performance:

This type of administrative error refers to situations in which the administrative body's performance of its responsibilities is subpar and causes harm to people. Poor service delivery or a lack of organization inside the facility may be the cause of these shortcomings. For instance, poor ventilation in offices, particularly when coal-burning devices are used for heating, can cause health problems for workers. Poor performance in the field of electronic public administration can take many different forms, but they all indicate a violation of the administration's duty of care to consumers of public digital services. In this case, the electronic public facility is accountable for the inability to maintain or arrange digital infrastructure, such as a poorly designed service platform with insufficient access points or complete functionality. A state or public organization may be held liable for misadministration if it offers few digital options that do not cover necessary services or does so in a way that is hazardous, unclear, or inaccessible[1].

Furthermore, systematic service faults may result from a lack of technical control, such as the failure to hire platform administrators, cyber security experts, or IT supervisors. These mistakes could put users at danger for things like account hacking, data breaches, or losing personal information, all of which the administration is required by law to avoid[2].

Administrative law philosophy and jurisprudence uphold the notion that the administration has accountability for systemic or organizational flaws that result in harm in addition to its deliberate or careless actions. Actionable faults under public service liability may include, in particular, poor application of electronic security standards, unclear platform instructions, poor management that permits unwanted access, or recurring technical errors.

In the digital age, where disruptions and instability can impact large segments of the population at once, such failures erode the idea of continuity and regularity of public services, which is essential to administrative law. As a result, inadequate electronic service delivery could lead to administrative compensation claims based on a facility's known or assumed liability. One prominent legal example is when administration platforms have shoddy authentication procedures that permit unwanted access or fail to adequately warn users about possible data dangers. In certain situations, the public administration could be held accountable for carelessness or poor management, particularly if these mistakes cause direct injury to people. Poor performance in electronic public administration is further exemplified by operational flaws, such as failing to implement security protocols, failing to provide electronic warnings about information security risks, providing unclear instructions that allow unauthorized access, or carrying out incorrect operations that negatively impact service recipients. Legal precedents highlight the state's responsibility for these shortcomings. For example, the Supreme Court ruled in Lucknow Development Authority v. M.K. Gupta that the state must reimburse the harmed party from public funds when public employees behave in a way that is unfair to them. Both conventional and electronic methods of providing public services are covered by this principle.

- Slowness or Delay of the Public Facility:

If the administration takes longer than the reasonable amount of time required by the nature of the work to complete its tasks, this is regarded as a public service error, and the administrative body is responsible if the person is harmed as a result. It is important to remember that if the law specifies a day on which the administrative body

[1] Ibid, P. 145.

[2] Cane, Op, Cit, P. 211.

must provide its services and the body does not operate on that date, it is a sign that the administrative body has chosen not to provide its services. This indicates that although the law did not place a deadline on the administration, it did prohibit it from operating too slowly, which could have harmed people and necessitated compensation. This indicates that although the law did not place a deadline on the administration, it did prohibit it from operating too slowly, which could have harmed people and necessitated compensation.

3.2. Assumed Error:

In some cases, liability may develop based on presumed error even in the absence of a proved fault. Liability in administrative law does not always necessitate explicit evidence of fault. Faute présumée, or presumed error, is a threshold that falls in between severe liability and proven fault. In technically complicated domains like electronic public administration, where culpability and causation may be hard to establish, it enables courts to presume negligence when an administrative act causes injury. For instance, the state may be held accountable without specific evidence of negligence if a recently implemented government software system causes widespread service disruptions, such as preventing access to unemployment benefits or public health services, on the grounds that such a breakdown would not typically occur without some sort of mismanagement[1]. The administration must next demonstrate that it took all required safety measures and that circumstances outside of its control caused the harm in order to disprove this assumption[2]. This legal concept is especially pertinent in e-governance settings, where it can be challenging to pinpoint fault due to algorithmic opacity and system complexity. As a result, presumed error turns into a safeguarding legal mechanism that makes sure people aren't left without compensation only because technical evidence isn't available or is hidden by proprietary technology.

Presumptive fault has long been acknowledged by the French Conseil d'État in public liability issues involving administrative services or faulty infrastructure, and it is applied when the administration neglects to maintain crucial public systems[3]. Several legal systems have modified this theory to meet the dangers of digitization, particularly with regard to the processing of public data and the automation of service delivery[4]. In this sense, the presumption of fault is consistent with both new international governance norms, such those established by the OECD, which highlight the precautionary obligation of public administrations running digital infrastructure, and constitutional notions of administrative responsibility[5]. In electronic public administration, where technological complexity might result in unanticipated problems, this strategy is especially pertinent. For instance, even in the absence of concrete proof of fault, the administration may be assumed to have behaved negligently if a public institution implements a new software system that unintentionally results in extensive service interruptions. In addition to protecting beneficiaries, this presumption guarantees that the administration upholds strict care standards in its digital activities.

This theory permits, under some circumstances, the assigning of blame to public authorities in the context of electronic public utilities, even in the lack of concrete proof of misconduct. This strategy seeks to recompense victims and guarantee accountability, but it also presents serious practical and legal issues. The theory of supposed error, for instance, was created by the Conseil d'État, France's highest administrative court, to handle situations in which the damage is exceptional, hard to explain scientifically, and out of proportion to the anticipated result[6].

[6] Duncan Fairgrieve and François Lichère. France. In Liability of Public Authorities in Comparative Perspective, edited by Duncan Fairgrieve and François Lichère, Cambridge University Press, Cambridge, 2017.

Similar to the French strategy, the UK's no-fault compensation policy in some public services aims to minimize litigation and expedite compensation procedures.

This presumption is based on the idea that, even in cases when a fault is not directly identified, the circumstances surrounding the damage strongly imply one. However, in order to apply supposed error, several requirements must be met:

- Definite Damage and Causal Link: There must be unmistakable proof of damage and a believable link between the damage and the operation of the public facility.
- Highly Likely Error: Even if an error cannot be detected with certainty, the facts should strongly imply that it occurred.
- Serious and Disproportionate Damage: The harm must be substantial and disproportionate to what was anticipated from the rendered service.

Even in cases when there is no concrete proof of culpability, this approach guarantees compensation for anyone harmed by public services. Additionally, it encourages public officials to uphold high standards of service delivery because they are aware that failure to do so may result in implied culpability. Critics counter that presumed error unfairly places the burden of proof on public authority, which could result in unfair liability. Once more, it can be difficult to determine whether supposed mistake applies, particularly when it comes to electronic public facilities where technological problems can have multiple facets. Furthermore, the use of presumed error may result in more lawsuits against public officials, which would raise questions about how best to allocate resources and the possibility of defensive tactics that could degrade the quality of services.

In order to improve adaptability and responsiveness, administrative judges are given considerable latitude in the application of French administrative law. The varied nature of administrative actions and the unique circumstances of each case may not be addressed by a strict application of the law. There are two sides to the discretion given to administrative judges when using the presumption of error. It offers the adaptability required to handle the particulars of every situation, but it also brings with it difficulties with predictability and consistency. For example, the concept of legal certainty can be undermined by excessive judicial discretion, which can result in conflicting verdicts[1]. When judges are given a lot of discretion in deciding whether the presumption of error applies, same instances may have different results depending on the judicial interpretation of each judge. This fluctuation can undermine public confidence in the legal system and make it difficult for public officials to predict potential legal repercussions. Nonetheless, this can be lessened by using the proportionality principle, which can serve as a check on the arbitrary use of discretion. Judges are therefore influenced by this principle when rendering decisions that strike a balance between the rights of public authority and the purposes of justice. This promotes justice and accountability by guaranteeing that discretion is used within appropriate limitations[2]. Judicial monitoring is essential in situations involving intricate administrative procedures, including those pertaining to electronic public services. The complexities of technical considerations can make a simple defect assessment impossible. In these situations, the presumption of error enables courts to assign blame in a way that takes into account the intricacies of the administrative procedure, guaranteeing that people are not denied redress because of the technicality of the problem.

The concept of "presumed error" permits the attribution of liability even in the absence of concrete proof of wrongdoing by transferring the burden of proof to the public authority. This concept, for instance, requires the administration to prove the absence of culpability or the involvement of an outside cause in situations when there is

[1] Jean Massot, The Powers and Duties of the French Administrative Law Judge, In Comparative Administrative Law, edited by Susan Rose-Ackerman, Peter L. Lindseth, and Blake Emerson, Edward Elgar Publishing, Cheltenham, 2017, PP. 435- 445.

insufficient direct proof of fault. This makes it easier to compensate the harmed party[1]. However, it could be claimed that by placing an unwarranted evidential burden on public authority, the presumption of error compromises legal certainty. The burden of proof rests with the claimant, according to traditional legal norms. Deviation from this standard could result in unforeseen consequences and possible administrative liability overreach. Furthermore, it can be realistically difficult for the administration to prove blame or external causation, particularly when handling intricate administrative actions. The distinction between strict liability and fault-based liability is thus muddled by the presumption of error. Therefore, in order to resolve the issues raised by this concept, judicial review and possible legislative improvements would be crucial.

Through the use of the phrase "The damage reveals a defective performance of the public facility that naturally leads to the establishment of administrative responsibility," the Conseil d'État and lower administrative courts have indirectly or implicitly indicated the principle of "presumed error". This implies that damage inevitably signifies a malfunction in the operation of the public institution, proving the administration's responsibility. The phrase changed over time to: "The damage reveals an error in the organization or management of the facility that naturally leads to..." This change suggests a clearer mention of managerial or organizational mistakes as the foundation for culpability. The courts highlight the obligation of public bodies to uphold high standards in the administration and execution of public services by imposing liability based on assumed faults in these areas[2].

Because consumers usually interact with electronic public services remotely, without direct monitoring of the underlying systems, pinpointing the exact cause of the issue becomes extremely difficult. Therefore, users can encounter problems like access issues, data discrepancies, or system malfunctions. Users frequently lack the knowledge and resources necessary to look into and determine the precise nature of the issue due to the technological complexity involved. Users might be unfairly denied compensation in the absence of the presumption of error since they would be unable to produce comprehensive proof of the error. The French Conseil d'État granted permission to apply the "presumed error" principle to the field of electronic public utilities in the landmark Savelli case (hospital-acquired diseases) in 1960[3]. The provisions of civil liability for the custodian of the item (responsabilité du fait des choses), which impose obligation on individuals in charge of things that need special care, have therefore been claimed by certain legal scholars to be applied similarly to electronic public infrastructures. In this case, the judiciary upholds the concept of access to justice by transferring the burden of proof to the public authority, ensuring that users are not penalized for events beyond their control. As long as the damage is obvious and the circumstances point to a management or organizational failure at the facility, it should be verified that supposed fault is linked to the electronic public facilities[4].

3.3. Liability Without Fault:

Liability without negligence has become a key concept in contemporary administrative jurisprudence, especially when it comes to public service endeavors requiring intricate technology systems. Administrative accountability has historically required fault, either through an established error or an assumption of one. The state may be held accountable for damages brought on by its actions even in the absence of culpability, according to recent legal developments, which show a substantial shift toward objective liability. In the digital age, when electronic public administration necessitates the deployment of complex digital infrastructures that may unintentionally inflict harm, the idea of no-fault liability—also known as responsabilité sans faute in French administrative law—is particularly

pertinent. For example, even though the administration had taken adequate precautions and had not engaged in any particular act of negligence, the impacted individuals may be entitled to compensation if a cyberattack compromises the data systems of a public facility, jeopardizing personal information or service continuity[1]. In its historic decision in Natsionalna agentsia za prihodite (C-340/21), the European Court of Justice (ECJ) reaffirmed this idea, holding that the General Data Protection Regulation (GDPR) may consider the mere fear of personal data misuse after a cyber incident to be non-material damage, triggering the state's duty to compensate[2].

To further ensure that victims are not overburdened with proving technical fault, legal scholars have argued that the threshold for administrative liability should be changed in cases involving high-risk digital operations, such as biometric data processing, AI-driven public decision-making, and nationwide databases. These opinions are consistent with the public law precautionary principle, which requires administrative entities to foresee risks and pay for any consequent losses as part of their duties to the public.

In situations involving abnormal and exceptional risks (le risque spécial et anormal), including those posed by governmental technological efforts, nations like France and Egypt recognize no-fault responsibility under comparative law[3]. These frameworks guarantee fair treatment of citizens impacted by state-initiated digital transitions and are both morally and legally required. Therefore, whether by creating new cases in this area or by codifying the accepted judicial principles in the area of culpability without error, the legislature was instrumental in promoting this duty. Furthermore, unlike responsibility based on error, which necessitates the presence of the three traditional elements—the error, the damage, and the causal relationship—responsibility in this context is established once two fundamental elements are present: the damage or harm and the causal relationship between it and the administration's lawful activity. Regarding "harm," the judiciary of the French State Council demands extraordinary circumstances in order for the element of injury to establish culpability without fault; the harm in this context must be unique and exceptional. While uncommon harm indicates that it is of a certain level of seriousness that makes it unusual, specificity indicates that the harm is intended at a specific individual or at individuals themselves. Therefore, the judiciary established administrative accountability without fault for electronic public services based on the concept of risks and the equality of persons before public obligations. In certain legal systems, the phrase “risk liability” is used interchangeably with “liability without fault”.

3.3.1. No Liability for Errors Based on Risk:

The idea of risk responsibility (responsabilité pour risque) has become a fundamental component of liability without fault in contemporary administrative jurisprudence, especially in the French legal tradition. This idea, which has its roots in a practical and ethical justification, illustrates a shift away from a system that places blame and toward one that prioritizes the fair allocation of damages resulting from public actions. The fundamental idea of risk theory is that, independent of any demonstrated wrongdoing or carelessness, the person who generates a risk and gains from it must also take responsibility for its manifestation. This idea has been crucial in determining state accountability, particularly in situations when harm results from the inherent risks of legitimate official action rather than from illicit activity.

This approach has long been accepted by French administrative courts, especially the Conseil d'État, which has used it in a number of crucial areas. Notably, in cases involving dangerous products, public works projects, medical facility operations, and state-run operations requiring high-risk procedures, jurisprudence has acknowledged accountability without fault. In these situations, the administration is held accountable for exposing people to abnormal dangers in the name of the public good, not for making a mistake.

[2] European Court of Justice, Case C-340/21, Natsionalna agentsia za prihodite, ECLI:EU:C:2023:994, 14 December 2023.

[3] Nadia Yas Al-Bayati and Mohamed Najm, The Legal Basis of Administrative Liability for Damage: An Analytical Study in the French Judiciary, Journal of Legal and Political Studies, Al-Miʿyār, Vol. 8, Issue. 8, 2020, PP. 4– 12.

The French approach to travaux publics (public works), where liability is incurred not because of proved negligence but rather because people experience particular or excessive injury as a result of otherwise legal infrastructure projects, demonstrates this conceptual movement. This strategy is best shown by the landmark Cormier decision, where the Conseil d'État upheld the possibility of compensation for harm caused by public works even in the absence of administrative misconduct[1].

Similar to this, the state's role in public hospitals has come to be seen more and more through the prism of risk. Courts have acknowledged that exposure to institutional risks alone is sufficient to establish responsibility in circumstances where patients are injured due to hospital-acquired infections or defective medical equipment. The fundamental justification is distributive justice, which is focused on the fair distribution of harm brought about by collective services, rather than corrective justice, which is based on blame[2].

When it comes to risky items and techniques used by public authority, such as firearms, explosives, or hazardous chemicals, the risk theory is further applied. Even when handled properly, these objects provide an inherent risk that, if acknowledged, places the onus of harm on the government. This application focuses more on recognizing that individuals who oversee dangerous tools in the service of the public must also pay for any injuries caused by such tools than it does on penalizing mistakes[3].

Furthermore, the acceptance of risk liability demonstrates a deeper philosophical commitment: the state must serve as a last-resort insurer since it is the main actor in society. A solidaristic view of public law, in which the state not only controls risk but also bears it on behalf of its people, is reflected in this dedication. This approach changes administrative law from a strict system of fault-based responsibility into a more compassionate, socially responsive framework, as noted by René Chapus[4].

By enforcing the no-error liability principle, the French legal system upholds a core tenet of public law: that the individual should not bear an excessive burden of public service. This strategy strikes a nuanced compromise between the demands of justice and administrative effectiveness. Public institutions are now more vulnerable to new types of harm, such as hacking, cyber espionage, and data breaches, as a result of our increasing reliance on digital infrastructure. Even though these actions are usually carried out by outside parties, they can seriously harm public infrastructure and services by causing disruptions, exposing private information, and undermining public confidence. The idea of responsabilité sans faute finds additional significance in the context of these changing challenges, especially when it comes to risk liability.

- Hacking is the deliberate infiltration into electronic systems in all of its forms. This could involve using malicious code to exploit software flaws, altering transmission protocols, or gaining unauthorized access to private information. Economic espionage, political sabotage, or data theft are the goals in some situations. Such attacks, in whatever form, are directed at the digital governance infrastructure itself.
- Electronic danger also includes espionage and the following unapproved release of private information. This includes the disclosure of material that was meant to be kept private and was retained by the state or a particular institution. Whether it concerns national security, citizen personal information, or the workings of state institutions, the public revelation of such data can have just as detrimental an impact as physical assaults on public infrastructure or risky behaviors.

A workable approach for dealing with these problems is provided by French administrative jurisprudence, which is based on the principle of risk. Similar to how courts have imposed culpability for damages resulting from the

[1] Conseil d'État, 2ème et 7ème sous-sections réunies, 26/11/2012, 354108, Publié au recueil Lebon.

[4] René Chapus, Droit administratif général, 15th ed, Montchrestien, Paris, 2001, P. 1032.

handling of dangerous goods or faulty public infrastructure, they can also apply this principle to the issue of digital vulnerability. The same legal reasoning applies in this case: the state bears the obligation for managing the risks involved when it gains from the digitization of public services and electronic governance. Like physical infrastructure, cyber infrastructure is inherently vulnerable to damage. The disproportionate expense of such exposure should not fall on the people or organizations impacted by cyberattacks, especially when those assaults target public services. So, whether a person suffers a privacy violation, financial loss, or reputational harm as a result of a breach of state systems, this qualifies as an anomalous and unique suffering warranting reparation. In this regard, hacking and data leaks that impact public electronic facilities ought to be handled in the same way as tangible harm brought on by institutional carelessness or public works projects. The state's duty to provide compensation should be triggered by the mere exposure to anomalous risk emanating from public digital infrastructure, regardless of whether the attacker is recognized or stays anonymous, and even if the breach happens without any internal misbehavior.

Though scholars and certain judicial trends support applying risk liability to digital infrastructure, particularly when public systems are compromised and citizens suffer specific harms, it should be noted that liability without fault has not yet been fully codified in French law for cyber incidents. According to German law, a public authority cannot be held liable unless they breach a public obligation and cause harm to a third party[1]. It is more difficult to establish liability without error because this typically needs fault (purpose or negligence). Nonetheless, compensation might be provided in specific situations, such as when essential infrastructure is not secured or when the data protection law's obligation to protect personal data (DSGVO/GDPR) is broken. Regarding stringent or risk-based culpability for cyber incidents, there is still a gap. The idea of sovereign immunity, which states that the federal or state governments cannot be sued unless they agree through law, has a significant influence on the U.S. legal system. Although there are several exclusions permitted by the Federal Tort Claims Act (FTCA), cyber incidents are not specifically covered. Courts have historically been hesitant to impose culpability without explicit statutory permission or proof of egregious conduct, notwithstanding recent litigation that has attempted to hold the government accountable for data breaches, particularly those involving federal agencies (such as the 2015 OPM hack)[2]. Although there have been few remedies, the government's obligation to protect data may give rise to constitutional privacy concerns. Lastly, in the UK, people can file claims under data protection laws (particularly the Data Protection Act 2018 that implements GDPR) or negligence laws. Claims for cyber events involving data owned by the government usually involve a proven loss and a breach of duty of care. Although courts frequently set a high bar for liability, there have been several attempts at class action following significant data breaches involving public bodies (such as the NHS). Claims may also be based on the Human Rights Act of 1998, particularly Article 8 (right to private life), although there are again few remedies available unless there is evidence of serious harm.

Many nations place a high priority on cybersecurity as a governmental function for national security, occasionally limiting liability to prevent impeding defense operations. Legal systems may need to create doctrines akin to risk liability or no-fault compensation in physical infrastructure law as cyber dangers change. In this sense, the French risk theory offers a viable foundation for this kind of development, pointing the way for other common law and civil law jurisdictions to modify their legal systems to accommodate the digital era. Therefore, when based on the notion of risk, the logic of responsabilité sans faute offers a moral and legal basis for expanding state accountability into the digital realm. It is consistent with a more comprehensive view of public law, where the state guarantees justice in the face of modern technology threats in addition to acting as a regulator and protector.

3.3.2. Equality Before Public Burdens: No Error Liability

The two primary grounds for liability without fault recognized by French administrative law are equality before public burdens, which emphasizes that legitimate administrative action shouldn't cause disproportionate harm to individuals or groups, and risk theory, which highlights the existence of abnormal danger or technical hazard. Both

[1] Helmut Koziol and Barbara C. Steininger, European Tort Law, Springer, Vienna, 2008, PP. 137–138.

frameworks uphold the notion that state liability is redistributive as well as corrective, acknowledging that justice in public administration must take into consideration both individual loss and group gain. One of the fundamental tenets of individual liberties and rights is the equality of people before burdens. Everybody must pay these taxes and public expenses when they are imposed by the state; no one may avoid them or have them placed on them. Even when there is no unique risk involved but harm is an unavoidable and disproportionate result of activities committed for the public benefit, this argument warrants culpability based on distributive fairness. This principle states that the state must make sure that no one person or small group is disproportionately affected negatively by measures it takes that serve the public good. If such harm takes place, compensation becomes an obligation based on equity and fairness rather than merely an administrative choice. This equality-based obligation addresses routine administrative actions that, while legal and generally advantageous, result in specific, direct, and unique harm to certain people. In this case, the harm or injury is a predictable and essential byproduct of the state's pursuit of the general welfare[1] rather than an incidental or unusual one. In this case, the harm results from the unequal distribution of the responsibilities that public policies invariably create rather than from a breakdown in public service or a duty violation. Therefore, the law requires the state to restore equality through compensation even in the absence of danger or administrative error. This was made abundantly evident in the landmark case of Couitéas, when the principle of equality before burdens dictated that compensation was due for the substantial and individualized injury caused by the unwillingness to expel squatters from private land, even though it was legally authorized in the purpose of maintaining public order[2].

The reasoning is simple: it is unfair for only a select few to experience the negative externalities of public policies if they are intended to benefit society as a whole. The state must acknowledge that the collective benefit must be matched by an equal allocation of expenses, for instance, when infrastructure investments result in expropriation, interruption, or financial loss to particular persons. Furthermore, this type of liability is especially pertinent in modern fields like cybersecurity, urban planning, and environmental regulation, where the harm is frequently caused by necessary and extensive administrative activity rather than dangerous practices. In the digital age, the same reasoning holds true: if the government digitizes its services for efficiency and the good of the country and a specific citizen is harmed by a systemic failure or data compromise, compensation ought to be provided—not due to risk or fault, but rather because an imbalance in burden has arisen[3].

The principle of equality before public services (égalité des usagers devant le service public), which states that all people in the same legal situation should have equal access to public services regardless of personal characteristics like wealth, location, or background, is one of the fundamental promises of e-administration. Theoretically, e - administration upholds this idea by providing services continuously and remotely and by eliminating geographical and temporal constraints. In actuality, though, digital inequality adds a new level of prejudice that jeopardizes the fundamental ideal that e-administration is supposed to support. Even if the statutory requirements for using public digital services are implemented consistently, some groups may be de facto excluded due to structural and technological inequalities, such as unequal access to devices, internet connectivity, and digital literacy. Even though they are legally entitled to e-services, people who are elderly, economically disadvantaged, or lack digital literacy may find it difficult or impossible to use them[4].

Furthermore, public digital services might only be accessible in specific regions or might be tailored for particular hardware or operating systems, resulting in an unequal environment where equal rights are not accompanied by equal capabilities. Therefore, even while the law acknowledges that all individuals are equal before the public service, the way eadministration is designed and implemented may result in unfair treatment and unintentionally limit access to privileged groups—those who have the requisite technical resources and expertise. These

discrepancies go against the fundamental administrative law tenet that all users must have nondiscriminatory access to public services. Scholars of French administrative law have pointed out that formal legal equality is only as significant as material equality in service access. When the state decides to digitize vital services, it also takes on the responsibility of making sure that everyone can use them, including through universal service design, targeted assistance for vulnerable customers, and supplementary analog channels[1].

The French Conseil d'État has long maintained that, particularly in cases where new modalities are implemented, access to public services must be tailored to the requirements and abilities of users. The logic of equality before public burdens and public services would imply that any public service transformation, digital or otherwise, must take into account and mitigate systemic disadvantages that prevent equal enjoyment of public rights, even though comprehensive jurisprudence in the field of e-administration is still lacking. Therefore, eadministration runs the risk of going against the fundamental tenet of treating all users equally when it replaces traditional service routes without guaranteeing inclusive access. In these situations, structural exclusion—a failure to design systems that fulfill the universal accessibility inherent in public service obligations—may give rise to administrative culpability rather than technological malfunction or negligence.

3.3.3. Refusing Liability For Errors:

By proving that there was no negligence or error on the part of the public authority that caused the damage, the authority can disprove this assumption of error. This can be accomplished by proving that an outside factor—such as the injured party's activities, the actions of a third party, or force majeure—caused the damage and was beyond the authority's control[2]. The public authority might not be held accountable, for example, if a user unintentionally caused the damage by their own conduct or if an unforeseen circumstance resulted in the damage. Liability is therefore not absolute in the absence of fault. General principles of causation still apply to it. Notably, the administration can be absolved of all or part of its culpability by claiming the existence of a foreign cause (cause étrangère), which is an outside factor that breaks the causal link between the administrative action and the harm. In this context, foreign causes are grouped based on how they affect the legal attribution of liability[3]. Whether or not the administration is held liable, there are several circumstances that totally absolve them. These include the victim's act (le fait de la victime), which occurs when the harmed party is accountable for their own injury due to careless or deliberate behavior, and force majeure (la force majeure), which is an unpredictable, unavoidable, and external event.

However, other causes—like a third party's mistake or a fortuitous event (le fait d'un tiers or cas fortuit)—usually only result in exoneration in cases involving guilt; they do not stop culpability without fault, especially when it comes to the theories of risk or equality before public duties[4].

For electronic public facilities, this divergence has important ramifications. Since many of these services are digital and run continually, there is a significant chance that outside threats, technical malfunctions, or third parties will interfere. However, unless they satisfy the strict requirements of a foreign cause that can sever the causative link91, these do not always absolve the administration of culpability[5]. For example, the administration can successfully reject responsibility in the framework of culpability without fault only under the following situations:

[1] Jean Waline, L'égalité des usagers devant le service public à l'ère du numérique, Revue française de droit administratif, Vol. 36, Issue. 2, 2020, PP. 215-225.

[4] Frédéric Rolin, Cyberadministration et responsabilité: la force majeure est-elle encore invocable?, Les Petites Affiches, Issue. 150, 2020, PP. 12-18.

[5] Frédéric Rolin, L'administration numérique et la responsabilité sans faute: vers une nouvelle catégorie de risques?, Revue française de droit administratif, Vol. 38, Issue. 2, 2022, PP. 210-219.

- The disruption of underwater internet connections due to a force majeure event, like a deep-sea earthquake, could cause administrative websites or services to go offline. Unpredictability, irresistibility, and exteriority in relation to the administration's sphere of influence are characteristics of such an event.
- The victim's action, such as when a citizen willfully creates a system error that causes their self-injury, carelessly enters inaccurate data, or abuses the digital platform[1].

However, in situations of liability without fault, factors like a third party's mistake (for example, a hacker breaching the public platform's security infrastructure) or an unexpected technical issue (for example, a virus interfering with public servers) typically aren't enough to break the chain of causation[2]. In the context of contemporary digital administration, these causes are not unexpected even though they are outside the administration's control. Courts are likely to take into account the administration's obligation to foresee and protect against such risks, particularly when handling critical public services, given the recognized incidence of cyber-attacks. In this perspective, a cyberattack does not represent a force majeure event; rather, it is a typical aspect of digital risk that the administration needs to understand and protect against[3].

Conclusion:

The study highlights that digital technical failures are no longer merely technical glitches, but have become a real source of administrative accountability, especially in an environment increasingly dependent on digital systems for public service delivery. The results showed that the administration bears a significant portion of the responsibility for these failures, whether the error is proven or not, as long as the damage occurred and could have been avoided through preventative measures and sound management. It also demonstrated that the absence of effective technical planning and weak digital governance increase the likelihood of system failures and undermine customer confidence in public services. Therefore, achieving a balance between digital modernization and the administration's legal liability is essential to ensuring service sustainability and efficient performance.

The legal approach revealed that determining the administration's liability for digital technical failures is linked to the degree of error and the possibility of proving it. The administration remains responsible whenever it is proven to have failed to take measures to prevent the failure or mitigate its effects. In cases where it is difficult for the injured party to prove the error, accountability for the administration is justified based on the presumption of presumed error, especially when the failures are recurrent or result from a clear oversight weakness. In cases involving vital facilities or essential services that cannot be interrupted, the administration may be held liable even in the absence of fault, based solely on the theory of harm. This reflects an evolution in legal thought toward protecting digital rights and compensating for associated damages. This trend reinforces the need for the administration to adopt proactive policies and secure technologies to limit liability and enhance public confidence in the digital system.

Keywords analyse du discours numérique, dynamique émotionnelle, interaction émotionnelle, réseaux sociaux, sémiodiscursivité.

Abstract
L'enlèvement de la petite Marwa, survenu le 22 mai 2025 à Constantine, a suscité une vive émotion collective, dont les réseaux sociaux ont constitué les principaux vecteurs de diffusion, de réception et d'amplification. Cet article examine, à partir de l'analyse d'un corpus de commentaires publiés sous une publication Facebook du journal Tout sur l'Algérie (TSA), la manière dont les internautes ont verbalisé, mis en scène et partagé leurs émotions. L'étude mobilise trois approches complémentaires : l'écologie discursive de Marie-Anne Paveau (2017b), la sémiodiscursivité émotionnelle de Raphaël Micheli (2014) et l'interaction argumentative de Christian Plantin (2011). Ce croisement théorique permet d'appréhender comment les émotions s'inscrivent dans des formes discursives composites et multimodales, façonnées par les « affordances » propres aux plateformes. L'objectif n'est pas de sonder l'intériorité affective des individus, mais d'analyser comment ces émotions sont formulées, données à voir et mobilisées pour produire des effets dans un espace numérique à forte charge affective.

Introduction

Les crimes touchant à l'enfance suscitent toujours une mobilisation émotionnelle particulièrement intense au sein des sociétés contemporaines. Chaque drame impliquant une victime mineure déclenche souvent une vague d'émotions collectives qui

traverse les familles, les institutions et, aujourd'hui, les espaces numériques. L'enlèvement de la petite Marwa Boughachiche, collégienne de 12 ans à Constantine, le 22 mai 2025, illustre de manière frappante ce phénomène. Le jour de sa disparition, elle quitte l'école à 10 h, après son dernier examen, et s'évapore sur le chemin menant à son domicile. Sans aucune trace, la famille sombre dans l'angoisse et la ville entière se trouve en état d'alerte. Très vite, le portrait de Marwa envahit les réseaux sociaux, amorçant une forte mobilisation en ligne.

Initialement traité comme un fait divers dramatique, l'événement prend rapidement la forme d'un phénomène social et discursif de grande ampleur. Les premières réactions numériques, notamment celles publiées sur la page Facebook du journal Tout sur l'Algérie (TSA), génèrent des centaines de réactions et de partages. Le corpus retenu dans cette étude, constitué de vingt-cinq commentaires publics postés le 25 mai 2025, reflète la diversité des émotions exprimées : colère, compassion, indignation, appels à la vigilance et débats sur la responsabilité parentale. Ces échanges témoignent d'un engagement émotionnel collectif dépassant largement le cercle familial ou local.

Dans ce travail, nous employons le terme « émotion » pour désigner une expérience collective et discursive, observable à travers des messages, des images, des signes typographiques et des symboles circulant dans les espaces numériques. À l'inverse, « l'affect » fait référence, selon Plantin (2021), à un état moins conscient et plus diffus, distinct de l'émotion manifeste dans la sphère publique.

Le web ne se limite plus, dans ce contexte, à un rôle de relais médiatique ; il constitue aujourd'hui un espace de co-construction, de circulation et de transformation du vécu émotionnel. Les formes d'expression, combinant mots, images, émojis et hashtags, produisent un flux structuré d'échanges. Ce flux s'organise conformément à ce que Paveau (2017b) définit comme une « écologie discursive », où s'entremêlent éléments textuels, visuels, sonores et technologiques. Cet agencement donne naissance à de nouvelles formes énonciatives qui modulent la production comme la réception des émotions.

L'émotion dans les discours numériques relève à la fois de l'acte d'énoncer, de la mise en scène (ou « émotion montrée ») et de l'élaboration d'arguments étayés par l'affect (Micheli, 2014). Elle se manifeste dans la langue, à travers des icônes, des récits personnels et par le biais de stratégies d'appel à la solidarité ou à la polémique. L'espace numérique connecte des internautes aux horizons variés et favorise l'émergence de récits collectifs, où la douleur individuelle se transforme en mémoire sociale. Cette mémoire est continuellement reformulée et réactivée à chaque nouvelle interaction.

Les échanges autour de l'affaire Marwa constituent ainsi un terrain d'observation privilégié. Ils rendent visible la manière dont une société mobilise ses émotions pour réagir, débattre, contester et influencer les discours sur la sécurité et la responsabilité collective. Les internautes ne se limitent pas à commenter : ils co-construisent et modulent le débat, amplifiant certaines émotions, en atténuant d'autres ou en introduisant des contradictions. Ces pratiques rejoignent les analyses de Plantin (2011) sur la dimension argumentative des émotions.

Cette recherche repose sur un corpus natif issu de Facebook, composé de vingt-cinq commentaires publics postés le 25 mai 2025. L'analyse combine trois perspectives : l'écologie discursive (Paveau, 2017b), la typologie de la sémiodiscursivité émotionnelle

(Micheli, 2014) et l'analyse interactionnelle des émotions et de l'argumentation (Plantin, 2011). Elle apporte un éclairage sur un phénomène encore peu étudié en littérature francophone : la mise en discours et la circulation d'une mobilisation émotionnelle au sein d'un événement d'actualité, dans un espace numérique natif.

Trois questions de recherche guident notre démarche :

1. En quoi l'environnement numérique façonne-t-il l'expression de ces émotions ?
2. Comment les émotions sont-elles discursivement construites, modulées et partagées selon la typologie de Micheli ?
3. Quels mécanismes interactionnels, tels que l'amplification, l'atténuation ou la contradiction, sont mobilisés par les internautes pour défendre leurs positions ?

Au croisement de ces perspectives, cette recherche ambitionne de révéler les dynamiques complexes de production et de diffusion des émotions collectives au cœur d'un drame criminel marqué par une forte charge pathémique, tout en contribuant à enrichir la compréhension d'un domaine encore largement à défricher : celui des interactions discursives propres aux espaces numériques contemporains, lesquels forment désormais le théâtre privilégié des engagements émotionnels et collectifs**.**

2.Cadre théorique

Pour comprendre la dynamique émotionnelle à l'œuvre dans les discours numériques liés à la disparition de la petite Marwa, il est essentiel de mobiliser un cadre théorique pluriel. Celui-ci croise trois perspectives complémentaires : l'écologie discursive (Paveau, 2017b), la sémiodiscursivité émotionnelle (Micheli, 2014) et l'analyse interactionnelle de l'argumentation (Plantin, 2011). Chacune de ces approches éclaire la manière dont les émotions s'inscrivent, circulent et se transforment dans les **t**echnodiscours natifs du Web.

2.1 L'approche écologique d'Anne-Marie Paveau

Pour Paveau (2017b), le discours numérique ne saurait se réduire à une simple transposition du langage traditionnel. Elle le conceptualise comme un « technodiscours », intrinsèquement façonné par l'environnement technique qui le rend possible. Dans cette perspective, l'écologie discursive conçoit le discours comme un écosystème vivant, c'est-à-dire un entrelacement dynamique de textes, d'images, d'hyperliens, d'émojis et de technographismes (Paveau, 2016). Parmi ces ressources, les iconotextes, qui sont des objets hybrides mêlant texte et image, contribuent à forger une expressivité émotionnelle propre aux espaces numériques.

Dans cet écosystème, l'émotion dépasse le simple ressenti individuel pour devenir un phénomène discursif. Elle s'y exprime à travers de multiples dispositifs sémiotiques, s'intensifie dans les fils de commentaires, se nuance par l'usage d'émojis et s'expose dans la mise en page des publications. L'écologie discursive permet ainsi d'appréhender l'émotion comme un phénomène émergent, co-construit par les affordances techniques des plateformes, les genres natifs du Web et les pratiques collectives d'écriture et de lecture (Paveau, 2017b ; Paveau, 2017a).

Le technodiscours natif, tel que le définit Paveau, s'inscrit dans le cadre plus large du discours numérique, entendu comme « l'ensemble des productions verbales élaborées en ligne, quels que soient les appareils, les interfaces, les plateformes ou les outils d'écriture » (Paveau, 2017b, p. 8). Son analyse repose sur le principe d'une égalité théorique entre les ressources langagières et non langagières, ce qui souligne la richesse des formes discursives propres au Web 2.0 (Paveau, 2016 ; 2017b, p. 27).

Ce cadre théorique introduit des néologismes tels que technodiscours, technomot, technosigne, technogenre ou technographisme et marque une rupture épistémologique dans l'étude des discours numériques. Adopter cette approche revient à opter pour une posture post-dualiste et écologique, dans la mesure où elle dépasse les visions logo- et anthropocentrées et reconnaît le rôle actif des agents non humains, dispositifs, plateformes, outils numériques, dans la production du sens (Paveau, 2016 ; 2017b, p. 11).

Penser les émotions dans la société numérique, c'est admettre que chaque mot, image, émoji, hashtag ou hyperlien contribue à structurer le sens. Les réseaux sociaux, en tant qu'écosystèmes dynamiques, deviennent les lieux où s'entrelacent textes, images, fils de commentaires, gestes numériques et interactions. C'est dans ces espaces que les émotions collectives liées aux drames sociaux se cristallisent, circulent et s'amplifient. Paveau souligne également la richesse du commentaire conversationnel qui, au-delà de la simple fonction phatique, porte un contenu discursif et métadiscursif élaboré (Paveau, 2017b, p. 46 ; Paveau, 2016). On distingue ainsi :

- Le commentaire discursif, qui prolonge le texte initial, crée du consensus ou suscite la polémique et module les émotions ;

- Le commentaire métadiscursif, plus réflexif, qui interroge la forme même du discours et enrichit la dynamique sémiotique des échanges en ligne (Paveau, 2017b, p. 47).

Cette vision intégrative montre que les dimensions techniques et langagières ainsi que la complexité des interactions participent activement à la circulation et à la modulation des émotions dans les espaces numériques (Paveau, 2016 ; 2017b).

2.2 La sémiodiscursivité émotionnelle (Raphaël Micheli, 2014)

L'étude des technodiscours natifs du web, où circulent et se transforment les émotions, requiert un cadre théorique capable de saisir la diversité des moyens par lesquels celles-ci se manifestent et acquièrent un statut repérable dans le langage. Dans cette perspective, Raphaël Micheli (2014) propose une approche sémiodiscursive fondée sur la sémiotisation des émotions, définie comme l'ensemble des procédés, verbaux ou coverbaux, qui rendent perceptible et interprétable une émotion dans le discours. Cette notion déborde le simple lexique pour intégrer toutes les ressources langagières : choix syntaxiques, modalités prosodiques ou gestuelles, ainsi que, plus largement, les dispositifs multimodaux. Micheli (2014, pp. 18-20) concentre son analyse sur la dimension verbale, tout en soulignant que les émotions sont « à la fois dans le langage partout, et nulle part » Micheli (2014, p.8), ce qui traduit leur caractère diffus et polysémique. Sa réflexion repose sur trois principes : couvrir la diversité réelle des phénomènes avec un nombre limité de catégories analytiques ; expliciter de façon rigoureuse les critères et définitions retenus ; fournir un outil descriptif opératoire pour l'analyse de corpus authentiques (Micheli, 2014, p. 13).

C'est dans ce cadre qu'il propose une typologie articulée en trois modes fondamentaux, souvent intriqués dans les discours réels : l'émotion dite, l'émotion montrée et l'émotion étayée. Le premier mode, l'émotion dite, correspond à la forme la plus explicite de manifestation émotionnelle. L'émotion est ici exprimée clairement par un mot qui la nomme (nom, verbe ou adjectif), lié grammaticalement à la personne qui la ressent et, parfois, à son objet ou à sa cause (Micheli, 2014, pp. 22-24). Cette formulation directe, sans ambiguïté, facilite la compréhension pour le destinataire, car le discours indique à la fois le nom de l'émotion et la personne qui l'éprouve (Micheli, 2014, p. 23). Le deuxième mode, l'émotion montrée, procède par manifestation indirecte : l'émotion n'est pas lexicalement mentionnée mais suggérée au moyen d'indices discursifs, prosodiques ou graphiques (interjections, structures syntaxiques marquées, marqueurs rythmiques ou typographiques). Micheli (2014, pp. 25-28) décrit ce mode comme une propriété du message plutôt qu'un thème explicite, reposant sur un processus inférentiel de l'allocutaire. Cette analyse est approfondie dans un travail ultérieur (Micheli, 2015), qui précise les procédés de sémiotisation verbale et montre comment, dans les environnements numériques multimodaux, ils s'articulent avec d'autres formes sémiotiques pour renforcer la portée émotionnelle. Enfin, l'émotion étayée désigne un mode plus complexe, à dominante argumentative, dans lequel l'émotion est induite par la représentation discursive d'une situation conventionnellement associée à un état émotionnel particulier (Micheli, 2014, pp. 29-31 ; Micheli, 2013). L'allocutaire ne la déduit pas d'un terme explicite ou d'un indice isolé, mais à partir d'une schématisation discursive qui organise la cause et légitime l'émotion selon des normes socio-culturelles partagées. Ce mode engage ainsi la dimension évaluative et normative du discours et joue un rôle central dans la construction collective des émotions en contexte d'interaction. Pour Micheli (2014, pp. 14-15), il ne s'agit pas de compartimenter des catégories étanches : dans les pratiques discursives effectives, les trois modes se combinent, se répondent et se renforcent mutuellement. Le dire explicite fixe un cadre clair, la monstration contribue à modeler la tonalité émotionnelle, et l'étayage en justifie la présence et l'intensité dans l'espace socio-discursif. Appliquée aux environnements numériques, cette grille fournit un outil heuristique pertinent pour décrire la manière dont les émotions, en s'entrelaçant aux structures interactionnelles et médiatiques, acquièrent leur force signifiante et mobilisatrice.

2.3 L'approche interactionnelle de Christian Plantin : les émotions comme bonnes raisons argumentatives

Dans le cadre de l'analyse du discours argumentatif, l'émotion ne se limite plus à un simple parasite de la rationalité, mais s'impose comme un acteur central et inséparable. Christian Plantin nous invite à repenser l'émotion comme une force vivante, façonnée dans le feu de la discussion, qui participe pleinement à la construction et à la légitimation des points de vue (Plantin, 2021). Loin d'être un vécu intérieur isolé, l'émotion se tisse dans les échanges, se négocie et s'exprime à travers mots, gestes et même images. Elle devient ainsi un véritable langage affectif, modulant et enrichissant la trame argumentative (Plantin, Polo, Lund, & Niccolai, 2013).

Plantin dresse une distinction capitale entre affect et émotion : le premier, emprunté à la psychanalyse, désigne une énergie psychique souvent enfouie et inconsciente, tandis que l'émotion se manifeste dans l'instant, visible et palpable, qu'elle soit verbale, corporelle ou numérique (Plantin, 2021). Cette double nature éclaire parfaitement comment l'émotion fonctionne à la fois comme ressenti personnel et phénomène social, enraciné dans la situation d'énonciation.

Pour décrypter cette complexité, Plantin (2020) propose la notion d'épisode émotionnel, une unité fine qui relie le contexte social, l'acte de langage, les réactions corporelles et la dynamique collective. Ce concept original distingue trois figures clés : L'expérimentateur, qui incarne et exprime l'émotion ; l'allocuteur, qui attribue ou commente une émotion, que ce soit pour soi-même ou pour autrui ; et l'orchestrateur, qui régule la tonalité émotionnelle collective en validant ou en censurant certaines expressions.

Avec l'émergence des environnements numériques où images, vidéos et textes s'entrelacent, ce prisme analytique permet de comprendre avec finesse comment ces émotions sont à la fois vécues et négociées collectivement.

Plantin (2021) met en avant quatre manières dont les émotions s'organisent dans le discours : le renforcement qui unit autour d'un accord, l'amplification qui exacerbe les affects, la contradiction qui ouvre sur le désaccord, et l'atténuation qui apaise les tensions. Cette dernière observation révèle combien la dynamique émotionnelle privilégie souvent la recherche d'un équilibre, évitant les affrontements frontaux au profit d'une gestion subtile des émotions au sein du débat.

Enfin, comme le développe Plantin (2011) et repris dans ses travaux plus récents (2020), l'émotion n'est pas un simple décor, mais un acteur stratégique et pleinement intégré : une « bonne raison » mêlant raison et sentiment, capable de persuader, de légitimer et d'orienter. Cette lecture interactionnelle s'avère particulièrement pertinente pour saisir les technodiscours où la vitesse et l'intensité des émotions créent des mémoires collectives et alimentent la mobilisation sociale.

Ainsi, loin d'être un simple ornement, l'émotion se révèle une force motrice, travaillée et utilisée dans le tissu même de l'argumentation, incarnant à la fois la richesse humaine et la puissance stratégique du discours.

3.Méthodologie et corpus

3.1 Méthodologie de recherche

Explorer les émotions qui circulent dans les replis numériques d'un fait divers revient à s'aventurer dans un espace où le texte et le pathos s'entrelacent à la vitesse d'un fil d'actualité. Notre terrain n'est pas un lieu physique mais une page Facebook, celle du média algérien *Tout sur l'Algérie* (TSA), où, le 25 mai 2025, une publication a déclenché un véritable séisme affectif. En quelques heures, l'annonce de la disparition inquiétante de Marwa, collégienne de douze ans à Constantine, a généré plus de deux mille deux cents mentions « J'aime », sept cent soixante-douze commentaires et neuf cent soixante et onze partages. Ce déferlement, loin de se réduire à un amas de chiffres, dessine les contours d'une mobilisation collective instantanée, à la fois spontanée et amplifiée par l'architecture algorithmique de la plateforme. C'est dans ce flux dense, presque torrentiel, que nous avons choisi de plonger, en prélevant vingt-cinq commentaires comme autant de fragments discursifs porteurs d'indices émotionnels, traces minuscules mais révélatrices d'un moment social condensé.

Le choix de TSA comme source de corpus n'est pas anodin. Média numérique à forte audience, TSA occupe une place structurante dans le paysage médiatique algérien, notamment via Facebook, où ses publications suscitent un haut degré d'interactivité. Facebook devient ainsi un espace d'étude privilégié pour analyser la circulation des émotions, à travers un format natif, le commentaire, où se mêlent indices pathémiques et dynamiques interactionnelles.

Pour la collecte des données, nous avons utilisé la capture d'écran comme outil, ce qui permet de figer le contenu dans son contexte visuel natif tout en conservant les éléments para- et non verbaux (émojis, typographie, ponctuation expressive). Conformément aux principes éthiques de la recherche en sciences sociales, nous avons préservé l'anonymat des internautes : toute information nominative ou visuelle permettant une identification directe ou indirecte a été supprimée ou floutée.

Dans cette optique, notre méthodologie croise trois perspectives théoriques majeures :

- L'approche écologique de Paveau (2017b), qui permet de situer l'émotion dans un écosystème technodiscursif structuré par les affordances du numérique (formats, émojis, technographismes) et la co-présence de signes verbaux et non verbaux.

- La typologie sémiodiscursive de Micheli (2014), qui propose de distinguer trois modalités d'expression émotionnelle : l'émotion dite (explicitement nommée), montrée (manifestée indirectement) et étayée (argumentée dans le discours).

- L'approche interactionnelle de Plantin (2011, 2021), qui envisage l'émotion comme une force dialogique mobilisée dans le débat pour renforcer ou contester une position.

Pour mettre en œuvre ces perspectives de manière opérationnelle, nous avons élaboré une grille d'analyse à la fois qualitative et typologique, articulée autour de cinq dimensions principales :

Dimension d'analyse	**Description**	**Approche théorique mobilisée**
Forme d'énonciation émotionnelle	Émotion dite, montrée ou étayée	Micheli (2014)
Type de technodiscours	Statut, commentaire discursif, commentaire métadiscursif, usage d'émojis, ou de technographismes	Paveau (2017b)
Fonction interactionnelle	Accord, contradiction, amplification, atténuation	Plantin (2021)
Rôle de l'énonciateur dans la séquence	Position du locuteur dans la séquence discursive où l'émotion est construite,	Plantin (2021)

émotionnelle	affichée ou discutée, en tant qu'expérimentateur, allocuteur ou orchestrateur *(Plantin, 2011, p. 208)*	
Cibles et objets de l'émotion	Individus, institutions, société, soi-même (auto-affect)	Micheli (2014); Plantin (2011, 2021)

Cette grille a été appliquée manuellement aux commentaires sélectionnés, en tenant compte du contexte discursif, de l'organisation séquentielle des échanges, ainsi que des signes para- et non verbaux (émoticônes, typographies, ponctuation expressive). Elle permet d'identifier à la fois la nature des affects exprimés et les dynamiques discursives qui organisent leur propagation dans l'espace numérique.

Cette méthodologie inductive, ancrée dans une lecture fine du corpus natif, vise à faire émerger les configurations affectives et interactionnelles propres aux techno-discours sur la disparition de Marwa. L'analyse qui suit exposera de manière détaillée ces résultats, en soulignant les régularités, tensions et singularités observées dans la mise en discours collective de l'émotion.

3.2 Illustrations du corpus

Cette section présente une sélection d'extraits du corpus, choisis pour leur portée expressive et leur valeur représentative. Chaque figure associe contexte et analyse sémio-discursive afin de montrer la diversité des formes émotionnelles et interactionnelles observées.

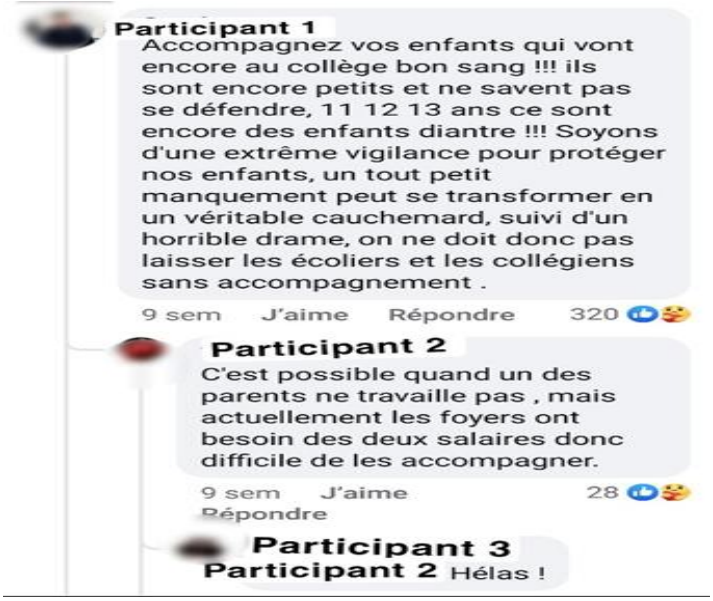
Figure 1. Publication initiale de TSA annonçant la disparition de Marwa.

Contexte d'amorce de la mobilisation : technographisme affectif suscitant une réaction collective immédiate. Publication native multimodale mobilisant l'image et une formulation dramatique pour solliciter l'émotion partagée.



Participant 1
Accompagnez vos enfants qui vont encore au collège bon sang !!! ils sont encore petits et ne savent pas se défendre, 11 12 13 ans ce sont encore des enfants diantre !!! Soyons d'une extrême vigilance pour protéger nos enfants, un tout petit manquement peut se transformer en un véritable cauchemard, suivi d'un horrible drame, on ne doit donc pas laisser les écoliers et les collégiens sans accompagnement .

Figure 6. Témoignage validant un comportement parental stigmatisé. Technographisme empathique en spirale dialogique. Le fil d'échanges met en scène une valorisation rétrospective du surinvestissement parental, converti en norme de vigilance

sur fond de solidarité émotionnelle.

Figure 7. Prières et émotions dans un message de soutien.
Technographisme pathémique à dominante spirituelle : message religieux d'espoir collectif exprimé dans une double modalité verbale et visuelle, renforcée par l'usage d'émojis et de sticker.

4. Analyse discursive des émotions

L'analyse des 25 commentaires issus de la publication Facebook de TSA révèle une forte densité émotionnelle articulée autour de trois axes majeurs : la vulnérabilité des enfants, la défaillance des institutions, et la solidarité collective. Ces dynamiques affectives, inscrites dans un environnement technodiscursif natif, activent des formes variées d'énonciation émotionnelle, de positionnements interactionnels et de mise en scène des émotions.

4. 1Typologie du technodiscours (Paveau)

Le corpus se compose exclusivement de commentaires natifs issus de Facebook, principalement au format texte, avec une intensité variable en termes de technographismes et de dispositifs expressifs. Selon Paveau (2017b), ces productions langagières relèvent du technodiscours, en ce qu'elles sont co-construites dans un environnement numérique spécifique, structuré par les affordances de la plateforme (formats de publication, typographies disponibles, ressources émotico-iconiques). La forme dominante dans le corpus est celle du commentaire discursif, c'est-à-dire un énoncé autonome exprimant un point de vue, une émotion ou une position, souvent étayé par une argumentation. Ainsi, le Participant 1 développe un commentaire structuré autour d'une injonction parentale : « Soyons d'une extrême vigilance pour protéger nos enfants, un tout petit manquement peut se transformer en un véritable

cauchemar (…) on ne doit donc pas laisser les écoliers et les collégiens sans accompagnement. » Ce commentaire illustre l'investissement du locuteur dans la sphère discursive émotionnelle, où la construction argumentative renforce la dimension affective de la prise de parole.

Commentaire métadiscursif
Certains énoncés adoptent une posture métadiscursive, interrogeant la validité ou la véracité de l'information circulante. Les échanges entre les Participants 14, 15 et 16 montrent un usage du commentaire comme régulation discursive : Participant 14 : « Eiie a été retrouvée » ; Participant 15 : « arrêtez svp de partager des informations incroyable [sic] et croire les rumeurs, jusqu'à présent on n'a pas de nouvelles » ; Participant 16 : « fausse information tjrs disparue [sic] ». Ces prises de position ne concernent pas uniquement l'objet émotionnel (la disparition), mais également le fonctionnement discursif lui-même. Elles relèvent d'un contrôle de l'énonciation, dans une logique de crédibilisation ou de disqualification, typique des technodiscours sociaux.

Technographismes et expressivité émotionnelle
La présence de technographismes (capitalisation emphatique, ponctuation redondante, émojis) vient densifier l'expression émotionnelle. Le Participant 1 utilise plusieurs marques typographiques comme « bon sang !!! », « diantre !!! », qui soulignent une panique contenue dans une esthétique oralisée et exclamative. De son côté, le Participant 25 déploie un registre visuel fort : « Ke dieu [sic] la protege [sic] et la rend à sa famille saint [sic] et sauf 😭😭😭😭😭😭😭 ☹️💔💔 ». Cet énoncé se situe à la frontière du commentaire techno-iconique, croisant texte et technographismes dans une logique d'hyperaffect, amplifiée par la représentation visuelle d'une prière à travers un sticker animé de type GIF (Tenor), accompagnée du mot « aamiin » stylisé.

Iconotexte émotionnel
L'intégration du sticker animé dans le commentaire du Participant 25 relève d'un iconotexte : un énoncé hybride combinant texte et image dans une unité discursive affective. Ce dispositif marque une extension multimodale de la parole émotionnelle en ligne et matérialise l'affect non seulement à travers les mots, mais aussi par l'image dynamique et culturellement située du rituel religieux partagé. Cette co-présence de signes relève pleinement de l'écologie discursive décrite par Paveau (2017b), où les technologies modifient les modes de production et de réception du sens.

4.2 Formes d'énonciation émotionnelle (Micheli)

Les émotions dans le corpus se déploient selon les trois modalités établies par Micheli (2014) : émotion dite, émotion montrée et émotion étayée.

L'émotion dite correspond à une mise en mots explicite du ressenti ou à son intensification par des procédés linguistiques. Ainsi, le Participant 1 alerte : « Accompagnez vos enfants qui vont encore au collège bon sang !!! », puis insiste sur leur fragilité : « Ils sont encore petits et ne savent pas se défendre. » L'usage d'exclamations réitérées et d'expressions emphatiques (« bon sang », « diantre », « véritable cauchemar », « horrible drame ») signale une verbalisation directe de la peur et de l'indignation. De manière analogue, le Participant 21 dénonce : « On vit dans une société de monstre [sic]. » Ces énoncés condensent une émotion dite, marquée lexicalement et syntaxiquement, portée par un jugement

normatif.

L'émotion montrée se manifeste dans les éléments para- ou technodiscursifs tels que les émojis, la typographie expressive ou les ponctuations affectives. Par exemple, le Participant 8 clôt son commentaire par : « Voilà hedi ghalta ☹ », où l'émoji triste renforce la désolation suscitée par l'erreur administrative évoquée. Le Participant 25 publie une prière : « Ke dieu [sic] la protège et la rend à sa famille saint [sic] et sauf 😇😇😇😇😇😇😇 ☹💔💔 », combinant une formulation religieuse à une série d'émojis de supplication et de douleur, traduisant visuellement une tension affective intense. Enfin, des expressions telles que « Hélas ! » (Participant 3) ou « Non pas encore, malheureusement. » (Participant 18), bien que lexicalement sobres, expriment implicitement une tristesse partagée et activent une pathémisation douce du discours.

L'émotion étayée se rencontre dans les propos développés, où l'affect est intégré dans une argumentation ou un récit personnel. Le Participant 20 offre un témoignage fort : « Quand je pense que tout le monde riait et se moquait de moi lorsque j'accompagnais partout au collège (…) je suis de tout cœur avec son papa et sa maman. » Cette posture allie justification personnelle et solidarité collective, dans une logique d'étayage émotionnel où l'affect est mis en récit, légitimé et projeté vers autrui. Le Participant 12 mobilise également une stratégie argumentative : « Je ne sais pas mais l'école et le collège que j'ai fréquenté il y avait un surveillant à la porte (…) ce n'est pas compliqué à mettre en place mais en Algérie les parents laissent les enfants partir seuls. » Ici, la frustration est ancrée dans une critique raisonnée du dysfonctionnement institutionnel, intégrant l'affect à une rhétorique de réforme.

Cette pluralité d'énonciation émotionnelle révèle une **écologie discursive** propre aux technodiscours natifs, où le dire affectif cohabite avec le montrer et le démontrer, contribuant à une mise en scène polymorphe et multimodale de l'émotion.

4. 3 Analyse interactionnelle et pragmatique de l'émotion (Plantin)

4.3.1 Fonctions interactionnelles

Les commentaires observés dans le corpus s'organisent selon une logique d'interaction pathémique, où l'émotion est non seulement exprimée, mais aussi modulée par les prises de parole successives. Selon Plantin (2021), ces interactions affectives prennent des formes variées : amplification, accord, contradiction ou atténuation. Elles participent à la construction collective du sens et à la circulation des affects dans un environnement dialogique ouvert.

L'amplification se manifeste par des commentaires venant renforcer ou prolonger l'émotion initialement exprimée. Ainsi, le Participant 20, qui évoque sa propre expérience de stigmatisation liée à la protection de ses enfants, reçoit une série de réponses solidaires : Participant 21 : « Non madame, vous avez entièrement raison. » ; Participant 22 : « Exactement, nous aussi. Bravo Madame. » ; Participant 23 : « Amineeee. Ya Rab 🤲🤲🤲 ». Ces réactions valident l'émotion initiale, renforcent la légitimité du témoignage et intensifient l'adhésion collective à une norme protectrice. Elles traduisent un mécanisme de solidarité normative, typique des mobilisations affectives en ligne.

La contradiction intervient lorsque des informations, des interprétations ou des valeurs sont contestées. L'affirmation du Participant 14 : « Eiie a été retrouvée » est

immédiatement remise en cause par plusieurs internautes : Participant 15 : « Arrêtez svp de partager des informations incroyable [sic] et croire les rumeurs. » ; Participant 16 : « Fausse information, toujours disparue. » ; Participant 17 : « Arrêtez de dire des bêtises. ». Cette séquence illustre un processus de vérification collective dans l'urgence émotionnelle, où l'incrédulité, la colère et la prudence se superposent dans un effort de maîtrise du pathos.

La tension et opposition idéologique apparaît dans l'échange suivant : le Participant 4 affirme : « Les arabes, c'est après trois jours pour que la police en France (…) prenne la déclaration. » Ce propos est immédiatement critiqué par d'autres internautes : Participant 5 : « Un enfant mineur, en général, c'est le même jour. » ; Participant 6 : « C'est vraiment du n'importe quoi ! Les disparitions de mineurs sont prises tout de suite. » ; Participant 7 : « N'importe quoi, peu importe où l'enfant est, l'alerte est donnée le même jour. » Cette séquence témoigne d'une polarisation argumentative : certains mobilisent un discours de discrimination institutionnelle fondé sur l'appartenance ethnique, tandis que d'autres corrigent ce discours par l'appel à la norme juridique ou au vécu personnel. L'émotion s'accompagne ici d'un enjeu de vérité et de légitimité morale.

L'atténuation se produit lorsque certaines interventions, bien que critiques, adoptent un ton modéré et visent à réduire la tension. Ainsi, le Participant 15, face aux rumeurs circulantes, précise : « Je ne l'ai pas inventé, je l'ai su à travers une page (…) j'espère qu'elle sera retrouvée très rapidement. » Ce type de commentaire évite la confrontation directe tout en exprimant une forme de regret ou de prudence. Il participe à une régulation émotionnelle par la nuance, essentielle dans les dynamiques interactionnelles complexes.

Ainsi, les fonctions interactionnelles mises en évidence révèlent une configuration affective dialogique, où les internautes s'engagent dans un jeu de validation, de critique ou d'amplification des émotions d'autrui. Loin d'être accessoires, ces fonctions structurent la mise en discours collective de l'émotion dans l'espace public numérique.

4.3.2 Rôle des énonciateurs dans la séquence émotionnelle

L'analyse du corpus révèle trois postures principales : expérimentateur, allocuteur et orchestrateur (Plantin, 2011, 2021), rôles ni exclusifs ni stables mais évolutifs selon les dynamiques affectives. L'expérimentateur parle depuis un vécu émotionnel direct. Le Participant 20 déclare : « Quand je pense que tout le monde riait et se moquait de moi lorsque j'accompagnais partout au collège aux cours particuliers… », une parole incarnée et vulnérable fondée sur la mémoire et l'injustice vécue. L'allocuteur adopte une posture adressée vers le collectif, souvent prescriptive. Le Participant 1 interpelle : « Accompagnez vos enfants qui vont encore au collège bon sang !!! (…) on ne doit donc pas laisser les écoliers et les collégiens sans accompagnement. », transformant sa peur et son indignation en norme d'action sociale. L'orchestrateur régule les émotions collectives dans les situations de tension et de désinformation, à l'image du Participant 6 : « C'est vraiment du n'importe quoi !! Les disparitions de mineurs sont prises tout de suite, je suis bien placée pour le savoir !!!! », qui conteste les propos du Participant 4 et réoriente le débat vers des faits, tout en exprimant colère et indignation.

4.3.3 Cibles et objets de l'émotion

Les émotions exprimées dans le corpus se cristallisent autour de quatre grandes cibles, chacune portant une charge affective spécifique. Les enfants apparaissent comme les principales figures de l'émotion protectrice. Le Participant 1 insiste : « Ils sont encore petits et ne savent pas se défendre », exprimant une peur parentale et un sentiment d'urgence face à leur vulnérabilité. Les institutions scolaires et administratives sont fréquemment dénoncées. Le Participant 12 critique : « Ce n'est pas compliqué à mettre en place mais en Algérie les parents laissent les enfants partir seuls », suggérant un dysfonctionnement systémique et une responsabilité partagée dans la mise en danger. La société dans son ensemble est parfois désignée comme une entité pathogène. Le Participant 21 résume ce rejet par une formule lapidaire : « On vit dans une société de monstre [sic] », manifestant une indignation morale face à la déshumanisation perçue. Enfin, soi-même peut être la cible d'un auto-affect, comme en témoigne le Participant 20 : « Tout le monde riait et se moquait de moi (…) mais je suis de tout cœur avec son papa et sa maman ». Ce commentaire exprime un sentiment d'injustice personnelle tout en reconfigurant une solidarité avec les parents de Marwa.

Ces objets émotionnels traduisent une reconfiguration collective des normes de protection et de responsabilité, révélant comment un événement tragique réactive et redistribue les affects dans l'espace public numérique.

Discussion des résultats :

L'étude des commentaires autour de la disparition de la petite Marwa révèle que l'émotion qui s'y déploie n'est pas individuelle ni immédiate, car elle se construit collectivement à travers les formes d'expression et d'interaction propres aux plateformes numériques. Ces prises de parole tissent ensemble sens, normes et émotions, et les technodiscours natifs deviennent des lieux où l'on négocie et recompose ce que ressentir veut dire dans un espace partagé. Autrement dit, les technodiscours natifs fonctionnent comme des scènes où s'articulent et se recomposent ensemble émotion et discours.

Un noyau fort de cette construction est constitué par un pathos parental centré sur la fragilité des enfants. Cette émotion partagée, nourrie par l'image de l'innocence menacée, donne lieu à un registre discursif hybride où exhortations, injonctions et témoignages se mêlent pour produire des discours à la fois insistants et engagés. Le commentaire du Participant 1, oscillant entre alerte poussée et appel à la vigilance, illustre la tension entre ce qui est dit comme émotion explicite et ce qui se devine comme exigence morale. Ce n'est pas simplement une émotion exprimée, car elle est investie et mobilisée pour peser sur la réalité sociale, ce qui entraîne une moralisation par le ressenti.

Parallèlement, une dimension critique s'affirme avec clarté. En effet, beaucoup d'internautes adoptent une posture de dénonciation à l'égard des institutions scolaires, des forces de l'ordre ou de la société en général. Ces interventions ne relèvent pas d'une simple réaction émotionnelle, puisqu'elles portent un jugement et forgent une prise de position normative. L'indignation, la colère ou la désillusion deviennent ainsi des raisons argumentatives. Comme le montrent les travaux de Plantin (2021), les émotions fonctionnent ici comme de « bonnes raisons » qui structurent et légitiment une critique. La multiplicité des positions énonciatives, qu'elles soient assumées par des expérimentateurs, des allocuteurs ou des orchestrateurs, révèle un discours numérique profondément polyphonique, et chacune de ces postures joue un rôle dans la façon dont le débat se construit, se reçoit et transforme les émotions. Ce tissage collectif de

l'émotion s'inscrit dans ce que Paveau (2017b) conceptualise comme une écologie discursive, car les interactions, les technologies et les pratiques langagières se répondent et s'engendrent mutuellement.

Enfin, ce que l'on pourrait réduire à de simples effets de style, comme les émojis, les majuscules ou la ponctuation marquée, fonctionne en réalité comme des ressources sémiotiques puissantes. Ces technographismes structurent le rythme, l'intensité et la visibilité de l'émotion, et ils ne se contentent pas de décorer puisqu'ils façonnent véritablement le discours. À travers eux, on voit se jouer une sémiodiscursivité émotionnelle (Micheli, 2014), où l'émotion prend forme à l'intersection du verbal, du visuel et de l'interaction.

Au total, les commentaires constituent une co-construction émotionnelle et normative. La disparition de Marwa, loin de rester un fait isolé, devient le point de départ d'une narration collective où se mêlent peur, responsabilité partagée et solidarité. C'est dans la tension entre l'émotion individuelle et sa résonance communautaire que se déploie aujourd'hui la puissance mobilisatrice des technodiscours émotionnels.

Conclusion

L'analyse des commentaires autour de la disparition de Marwa révèle une construction collective et médiée de l'émotion, ancrée dans les architectures technodiscursives du web social. L'émotion, loin d'être une simple réaction isolée, se déploie selon des modalités interdépendantes, c'est-à-dire dire, montrer et étayer, et circule dans un espace polyphonique où s'entrecroisent mobilisation normative, régulation dialogique et jugement critique. Le pathos parental, la défiance institutionnelle et la solidarité s'articulent pour produire une narration émotionnelle qui oriente, interpelle et redéfinit les normes de protection et de responsabilité. Les postures énonciatives (expérimentateurs, allocuteurs, orchestrateurs) et les technographismes incarnent cette dynamique, car ils légitiment les émotions, en renforcent l'intensité et en augmentent la visibilité. La disparition de Marwa joue ici le rôle de déclencheur discursif, ce qui fait se rencontrer peur, critique sociale et lien solidaire pour générer une dynamique émotionnelle collective propre aux technodiscours contemporains (Paveau, 2017b ; Plantin, 2021 ; Micheli, 2014).

Ce travail ouvre plusieurs pistes pour prolonger l'analyse : suivre dans le temps la genèse et la recomposition des émotions entre immédiateté et persistance ; comparer leur déploiement sur d'autres plateformes aux affordances techniques différentes (X/Twitter, Instagram, TikTok) ; examiner la réception, c'est-à-dire la manière dont ces discours émotionnels sont perçus, relayés ou contestés par des acteurs externes (médias, autorités, communautés), afin d'en mesurer l'influence sur la normalisation et la mobilisation ; intégrer une dimension sociocognitive (identités sociales, croyances préexistantes, schémas de défiance) pour saisir les conditions en amont de l'émergence émotionnelle ; et enfin, interroger le rôle des algorithmes de visibilité et des dispositifs de modération, en confrontant ce cas à d'autres crises discursives, afin de distinguer invariants et spécificités contextuelles. En combinant description fine, typologie des énonciations et ouverture réflexive, cette étude montre comment, dans les espaces numériques natifs, l'émotion devient vecteur de sens, levier d'action et mécanisme de régulation sociale en contexte de crise.

Conflict of Interest

The author declares no known financial or personal conflicts of interest that could have influenced the research, analysis, or conclusions presented in this paper.

Keywords Image; Rference; Ideology; Connotation; form; Symbol; Recipient.

Abstract

This article seeks to reveal the ideologies and references that images carry, on the one hand, and the extent of their contribution to the process of social communication, on the other. This image has become the most open space that highlights various ideologies and cultures, shedding light on their characteristics and customs without restriction or condition. This research aims to study the dimensions of images, their ideologies, and the backgrounds underlying them, shedding light on their connotations and values, and the cultural, social, and psychological legacies they carry. These images serve as a reference point that brings together a group of manifestations that form meanings and connotations with ideological dimensions and connotations.

1. Introduction:

Today, the image plays a significant and fundamental role in our daily lives. Indeed, we live in an age of images, parallel to the age of words. In light of rapid development, it has become one of the most widespread and influential means of communication and media in many societies. Today's reality confirms that this is the age of the image, as the development of its tools and the capabilities of its production and product have contributed to its ease of access to the recipient, who now prefers and loves viewing it more than written texts. Given that the recipient is more likely to believe and believe in images, seeing them with their own eyes, communicating or consolidating a particular ideology or thought may be more effective using carefully selected images that radically impact the description of an event, its objectivity, and its credibility. The term "image" has been used with all kinds of connotations. For example, if we examine the various expressions of the word "image," we find that it has multiple and varying meanings depending on the era and date. Therefore, the image has a connection to taste and art, possessing a magical and semantic dimension, evident in the meanings and connotations that the image symbolizes and refers to. The image was another important form of communication and propaganda, playing a significant role in embodying meanings, ideas, and feelings. This is achieved through the cultural, social, and psychological heritage it carries within it, serving as a reference point for a group of manifestations that form the meanings and connotations of that image. Hence, the production of the image was based on a set of ideologies and references, whether religious, social, political, or cultural. These references subsequently produce and provide us with various forms and symbols that confront us with the problem of visual language, a visual language

developed through the mechanisms of reading and its diversity. This is what made it occupy a significant and important position in the field of semiotics; it became an alluring tool that works to attract, stimulate, and influence the recipient's mind. So, what is the concept of ideology? What are the ideological backgrounds that the image presents to us?

2. The Concept of Ideology:

The term ideology has attracted the attention of many researchers and scholars in the field of humanities and social studies, due to the multiplicity of intellectual trends witnessed in the humanities during the nineteenth century. These trends have shaped different and diverse ideologies used according to the context for which they were created. Perhaps one of the most important definitions in this vein is that of Antoine de Tracy, [1]who defined it as "the total system of ideas, beliefs, and general tendencies underlying certain behavioral patterns. They help explain the moral foundations of actual action and serve to guide it." Tracy considers ideology to be the science of ideas, or the science that studies the validity or falsity of the ideas held by people. These ideas are the basis for constructing theories and hypotheses that are compatible with the mental processes of members of society. The goal of this science was to "serve the desired goal through means that conceal objective truth from the subject who believes in it."[2]

3. The ideological backgrounds that the image presents to us:

The image constitutes a cognitive carrier and a reference through which the sender transmits his intentions and meanings. It is not merely a painting in which the artist redraws features, or a mere process of transfer. There are many meanings that the creator adds to his work, through the multiple connotations that the image refers to. Therefore, the researcher finds within the folds of the image that it consists of two basic aspects: the present aspect that is expressed through linguistic expression and the formation of the image within the artwork, and another aspect, which is the absent aspect to which the work in our hands refers us. In light of this connection, photography is established and formed as “a process of adjusting the apparent existence and the inner existence, and making these worlds perceived by sense, intuition, and reason.”[3] On this basis, the image was the visual language through which a totality of meanings was generated, based on a set of data provided by iconic representation as a visual production of natural objects, on the one hand, and data from elements that are neither natural nor living, on the other hand. This concerns what is called the plastic representation of human conditions, i.e., the plastic sign that "replaces reality, possesses the ability to affirm abstract objects, and makes the world legible."[4]

The image was a mixture of sensation and feeling, this process that occurs in the subconscious world voluntarily or involuntarily; because its owners are able to blend reason and emotion, and thus they are able to depict and imagine reality, so their language was "filled with symbols and characters, its words do not carry abstract meanings, but rather carry eye-catching ghosts of similes, metaphors and metaphors. The function of simile is to depict and clarify by moving from one thing to something similar to it, and through it the poet or writer expresses a meaning in himself, and the more distant and strange it is, the more wonderful and beautiful it is."[5] Thus, the artistic image worked to develop the artwork, and convey its special meaning on the one hand, and to perceive the truths that ordinary language is unable to perceive and communicate on the other hand.

The artistic image is the writer's comprehensive psychological experience, which addresses the senses and moves away from the direct depiction of reality, moves our imagination, and brings together contradictions and divergences, such that the function of one image cannot be separated from another in the text; because the experience is the complex connection between a group of visions, images, ideas and emotions on the one hand, and the way of expressing them on the other hand. Critics and rhetoricians, ancient and modern, have agreed that suggestion has the strongest effect on the soul, the greatest impact on it, and the strongest connection to it.[6]

3.1 Language Reference and Ideology:

This aspect lies in the meaning and all the words and sentences written on the image. These may be direct or indirect, but in the long term and cumulatively represent an ideological orientation that reflects the values, ideas, and beliefs of the communicator.

It is noteworthy that the author's name, "Mouloud Faroun," is written above the main title, "Ibn al-Faqir," in small black font. This color, considered a dark color, is important because it significantly contributes to conveying the message between the writer and the recipient. The font and color in this image significantly contribute to converging the meaning and concept, on the one hand, and to "conveying the idea and strengthening the psychological impact on the recipient," [7]on the other. However, what draws attention to the author's name is the word "Faraoun." Is this his real name, or was this name given to him?

Anyone who examines the name Pharaoh will find that it is not the surname of Mouloud, but was given to him by the French authorities, while his original name was Shaaban.

As for the novel's title, "Son of the Poor," which is the main title of the novel, it is written in bold, bold script at the top of the page of the image, in a distinctive dark red color that makes the text more prominent, as if it were outside the space of the image. This makes it occupy a dominant space within the image. Thus, the title becomes a stimulus that captures the eye and guides it to identify the subject.

The dark red color is also used in the title of the image to express the state and situation of the character of Son of the Poor, and the suffering experienced by the Algerian people during that historical era, on the one hand, and to arouse the reader's feelings and inflame their emotions, on the other. The title works to stimulate the reader's mind by evoking some of the historical events experienced by Algerian society, especially the poor class, a class that suffered injustice and deprivation at the hands of the French colonizers. These are the main titles in the image. As for the subtitles, we find the phrase: New Translation: Dr. Abdul Razzaq Obaid. It is written directly below the main title, and is written in small letters, slightly smaller than the letters used to write the author's name and the title. We also notice at the bottom of the image the address of the publishing house, which is: Dar Talantiqit. It is written in bold black letters to indicate the identity of the entity that published this book, for the purposes of marketing and advertising.

Hence, the titles written on the image are highly connected and cohesive due to the importance they give to knowing and understanding the connotations of the image, as it has a semantic load "semiological"[8] that carries within it moral, social and ideological values. Therefore, we find that many titles attract and entice readers to continue the reading process, and put them in a state of interaction with these texts through dialogue, discussion and understanding their internal content (see Figure 01).

Anyone contemplating this image will notice the word "tyrant" prominently and clearly appearing on the cover, forming a visual mark from which the sender's message emanated, turning it into a title that carries several questions and a set of connotations and codes. The word "tyrant" in this context is the predicate of a deleted

subject, which is understood to be: "he is the tyrant." But the question that arises here is, why was the subject deleted and the predicate left in the title? Was its deletion merely a deletion and nothing else? Or did the deletion of the subject have a purpose and meaning?

The basic principle of subject and predicate is "confirmation, but grammarians have permitted the deletion of one while the other remains when there is a clue indicating the deleted word." [9]The purpose of deleting the subject in this context is brevity on the one hand, and to stimulate the recipient's mind on the other. We also find that the word "tyrant" is written in a bold, bold script with strong, equal letters. [10]This script is called "ruq'ah" in Arabic, "the easiest of Arabic scripts, and was given this name because people in ancient times used to write it on scraps of paper. The singular is ruq'ah, with a damma on the "ra." Returning to the cover, we find the author's name, Muhammad Ghamri, written in a thin Persian script below the title. What is also noticeable in the title and author's name is the predominance of the color black, which is considered one of the dark colors that denote mystery and rebellion. It reflects frightening depth and mysterious secrets. Its importance is evident in this chapter, as it contributes significantly to sending the message between the writer and the recipient. Perhaps the color black for the word "tyrant" refers to and symbolizes the character of the Roman Caesar Nero.

Hence, we find that the lines and colors in this image significantly contribute to conveying the meaning and concept through their impact on the recipient's psyche. It's clear that the title adds aesthetic and artistic value to the image, giving it an ideological dimension.

3.2 The Ideology of Formation (Image):

Images are considered a form of expression and communication. They have had a clear influence on humans since ancient times, as evidenced by the drawings and figures found on walls and caves, as well as the statues erected during that period. They were shaped in a historically older era than oral discourse and written texts, and are more deeply rooted and embedded in the subconscious, memory, imagination, and mind. They are associated with the eye, the mirror, and rituals. In this sense, images emerged in the Middle Ages with Christianity, and the history of images became the history of religion. They played a significant missionary role, propagating beliefs and revitalizing the message of faith. However, images subsequently acquired greater social, economic, and political dynamism than words and ideas, transforming into a means of political communication with the masses, a force for material production, and a space for economic investment, profit-making, and wealth accumulation. However, the intersection of the history of photography and the history of technology has brought about a major digital revolution that has transformed humanity from a mere interest in image-making to the age of the screen. This revolution has broken down barriers and opened the doors wide to the tremendous development of images and the resulting radical change in people's lives, transforming them into a visual space exposed to the public, and in their way of seeing the world and each other. This has also engendered confusion in the status of traditional culture, heritage, and customs. In the current era, the image has become one of the most important means of clarification and explanation. "It is therefore neither the product of purely emotional nor purely rational labor; for art is the essence of civilizational endeavor, and civilization is not based on emotion alone, nor on reason alone, but rather the product of the fusion of the two together in the crucible of the creative human being."

The figure of the father, who takes up a large space on the cover, symbolizes the Algerian rural father, wearing a burnous on his back and a gauze wrapped around his head, taking up a large space on the cover. His image appears clearly and distinctly, carrying connotations, due to the importance it occupies in depicting movements and postures that express different meanings and connotations. In this image, it was easy to "move from the signifier to the signified, and from the drawn form to the expressed truth." [11]Beside the father, we find the son, who represents the poor child who suffers the hardships of existence, living with a calm and content soul. The image in this scene reflects the state of the Algerian child, and the deprivation and hunger he suffers. Signs of poverty and need appear on him, especially in the outward appearance of his clothes, which are torn and old, indicating the extent of the suffering of this group. Add to that what the child is holding in his hand, represented by a piece of bread, a condition that indicates the decline of social conditions. These shapes were merely a

depiction of reality, or a symbolic representation of it, embodying the idea and theme of the event; that is, they point to the harsh social conditions experienced by the Algerian family during that historical period. The image of the house on this cover also appears to us in its old form, its bright, shiny yellow color, a result of time and use. It was built with rock and clay bricks mixed with straw. The roof is a mixture of hollow bricks and reeds, and its floor is rammed and covered with a layer of smooth yellow lime, which suggests a simple, rural impression.

Through this approach, we can say that these shapes and drawings embraced human ideas and experiences represented in a set of beliefs. These ideas were indirectly personified by the image, presented to the viewer for re-analysis and reading. The reader of the image finds themselves surrounded by a diverse and diverse culture, containing a set of ideologies and connotations. This is what the cover of this image represents:

Anyone who follows this image will find that it contains a set of symbols and shapes, including:

1/ The head: The shape of the head occupies a large space, due to its importance in depicting movements and postures that express various meanings and connotations. "The image has devoted great attention to focusing on the head area, perhaps because gravity is more prominent in the head than in other areas of the body.[12]" The head is clearly depicted in this cover, appearing clearly and distinctly, carrying within it various connotations and expressions. To further understand these connotations and symbols, we examine the head from the following aspects:

- Face: The face is used as a means and a symbolic language - non-verbal - that symbolizes and expresses the emotions and feelings hidden within the soul that its owner wants to communicate to others. Therefore, it is one of the main tools that create "movements, obfuscation, and covering up the hidden conscience within the soul. It includes the eyes, lips, eyebrows, forehead, forehead, head, hair, nose, and mouth, all in an attempt to reveal fabricated meanings that the soul hides.[13]" Knowing how to read and interpret subtle facial expressions is an essential part of understanding non-verbal behavior and reading people.

The facial movements in this image reveal a state of anger and the ability to cause harm on the one hand, and the type of feelings and emotions underlying this person on the other. Hence, "the bodily signals we give off reveal the truth; since it is impossible to match the body's gestures and signs, studying the face and its gestures is an art in itself."[14]

From this statement, it appears that the face is a tool that reveals hidden meanings and connotations, such as hatred, anger, sadness, fear, and depression. Many gestures and connotations are not conveyed verbally except through facial expressions, which are the most expressive part of the communication and understanding process that takes place between sender and receiver.

- Eye movement: What is noticeable about the eye movement in the picture is that it attracts attention, and is characterized by intensity and hatred, raging towards others, showing hostility and malice, expressing the extent of

the arrogance and haughtiness of its owner. It also appears through this look that its owner is not open to dialogue and discussion, and aims behind it to arouse anxiety and fear in others, especially those who oppose his policy and are not with him in his party. Therefore, we find that the eye in this picture played a strategic role in conveying meanings and signals to others, as it was a translator of what is in the soul through the gateway of the soul or heart, as it foretells what a person's conscience and feelings are. The poet says:

The eye reveals what is in the heart of its owner, whether it is hatred or love. The hated one has an eye that believes it. He cannot conceal what is in the heart.[15]

In these two verses, the poet refers to "the role played by the eye in expressing what is going on in the depths of its owner[16]".

The eyes represent the emotional and psychological state of the character, which appears through the image as a result of internal conflicts and repressions. Many philosophers and critics have spoken about the psychological dimension, including Freud, who established the theory of repression: "Which he traces back originally to the conflict between two opposing desires. This conflict occurs in the conscious area, and ends with the psyche ruling in favor of one of the desires and abandoning the other. This is what makes the psyche harmed by the conflict, so it experiences repression, and thus the desire moves from the conscious area to the unconscious."[17]

Through this theory, Freud believes that the feeling of repression within the psyche generates two conflicting desires, one of which manifests as apathy. These feelings are primarily manifested in the protagonist, who has experienced several internal psychological conflicts.

This feeling is what is known in psychology as "repression," which later manifests itself in various forms. As we note, the repression within him, stemming from a past event, continues to affect him, manifesting in his loss of desire to live.

This feeling, in turn, also creates another feeling within him: the absurdity of existence for him and for the world. Life no longer has meaning except through domination and control over others.

From this, we understand that the eye plays a significant role in the communication process, and this visual contact makes the relationship between the sender and the receiver increasingly clear. The meanings and symbols conveyed by the eye to the receiver, such as anger, sadness, happiness, etc., become more clear, understandable, and expressive.

2/ The Sword: In ancient times, the sword was of great importance to its users, whether Arab or non-Arab. It held a special place among fighters, as it symbolized strength and courage, and they excelled in its use. There is the Arab sword, the Roman sword, the Japanese sword, etc. The sword in this form takes up a large area, as it is centered in the sheath, appearing long, a feature that distinguishes the Roman sword. It was famous throughout Europe for its use in major battles and wars. It also indicates the policy pursued by Caesar Nero in managing government and the affairs of the people, represented by the use of violence and force, and even murder, against anyone who opposed his policy and opinion. This is what actually happened, as he killed those closest to him, as a result of opposition to his actions and behavior (his mother - his wife Octavia - his second wife Poppies - his teacher Seneca).

3/ Persecution: Christians were persecuted by ten Caesars, who subjected them to all kinds of torture. The persecution that Christianity was subjected to by Nero is considered the largest and most brutal. Its circumstances date back to the year 64 AD, when a horrific fire broke out in Rome, destroying half of it. The flames devoured large parts, and thousands of residents perished. Fingers of accusation pointed to Nero, indicating that he was the perpetrator. He needed a scapegoat, but found no one before him but the Christians, so he pinned the blame on them and began torturing and burning them with fire in front of the Roman people. This is what the cover image shows, as it shows men hanging on wooden boards in the shape of a cross. This cross symbolizes Christianity. The tragedy reached its peak at night in the imperial gardens when the Christians were set on fire after being oiled and nailed to pine poles.

Conclusion:

We can draw from the above a set of conclusions, including:

- The image is the essence of the visual arts. Although some arts require words and sound to express certain things, the image created a new language that captured the energy of sight, capturing the mind and imagination. This evolved into an interaction that was invisible to the image and unconscious to the human being, changing life around the world, crossing borders, and revealing many truths.
- The image is the meeting place of the arts and the threshold upon which the recipient stands before engaging in a work of art. It has witnessed several artistic transformations in the modern era and had a significant impact on the creation of new concepts across all cultural, social, political, and even economic activities. It has been a translation of many of the psychological and social states experienced by individuals amidst these ideological and cultural conflicts, in order to survive and continue in life, to search for self, and to find a better reality for the human soul.
- Man has transformed the image from an idol to art, transforming it into a successful channel of communication. Technological development has led to the control of images and has formulated a new theory of governance that replaces physical coercion with the control of public opinion through the control of image transmission. The captivating image has become a fascinator for naive eyes and empowers symbolic regimes to impose their control over the masses. Images have become a tool of control and an ideology of domination, alongside the power of money.
- The image represents a vessel for ideology. The aesthetic, musical, and linguistic momentum inherent in a literary text is itself ideological. The aesthetic aspect is ultimately an expression of a particular intellectual position, and ideological concepts exist within the realm of linguistic expression and are governed by its logic. Language is a tool for control as much as it is a tool for communication. Therefore, linguistic forms allow for the transmission of meaning and its ideological shaping.

Acknowledgment

The author would like to express sincere gratitude to the Faculty of Arabic Language, Literature, and Arts at Hadj Lakhdar University, Batna 1, for providing academic support and a stimulating research environment. Special thanks are also extended to the Poetry Laboratory for fostering scholarly dialogue that enriched the preparation of this study.

Conflict of Interest

The author declares that there is no conflict of interest regarding the publication of this article.

Issue web link https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html

Keywords Artificial intelligence, legislation, legal drafting, quality of law, legal language, machine translation, legislative simplification.

Abstract

The rapid advancement of artificial intelligence (AI) has created transformative opportunities for the legal field, particularly in legislative drafting and interpretation. This study examines the role of AI in enhancing the quality of legislation through advanced analytical tools capable of processing vast bodies of legal data, detecting inconsistencies, predicting legislative impacts, and identifying regulatory gaps. Furthermore, AI contributes to simplifying the language of law by supporting clearer drafting processes, improving legal translation, and enabling the development of virtual legal assistants that can make legislation more accessible to citizens.

Despite these benefits, the integration of AI in legislative processes raises significant legal and ethical challenges. Concerns regarding accountability, algorithmic bias, intellectual property rights, and the transparency of automated decision-making remain unresolved. These challenges highlight the need for careful governance frameworks that balance innovation with principles of fairness, privacy, and data protection.

Ultimately, this study argues that AI holds the potential to improve legislative clarity and societal inclusivity by producing laws that are not only technically precise but also comprehensible to the general public. By fostering greater awareness of rights and obligations, AI can contribute to building more transparent, efficient, and citizen-centered legal systems.

Introduction:

In light of rapid technological developments around the world, artificial intelligence has become one of the most important technical tools affecting many aspects of social life. The law is one of the areas touched by this change, with artificial intelligence techniques now being used to support the legal process at various stages: from preparing bills to reviewing and drafting them, and finally interpreting and simplifying them for those affected by them.Using artificial intelligence is a critical tool for improving the quality of laws in terms of internal coherence, linguistic accuracy, and clarity, as well as making them more accessible to individuals, which helps to enhance the principle of legal security and increase confidence in the legislative system.

Due to its complexity and technical structure, legal language often constitutes an obstacle for citizens when it comes to understanding legal texts. This has a negative effect on the effectiveness of these laws and the degree to which individuals adhere to them. From this standpoint, artificial intelligence appears to be an effective tool for simplifying the drafting of legal texts and facilitating access to their content through linguistic and lexical text

analysis tools, including rewriting legal materials in an easy-to-understand manner without compromising their accuracy or legal basis.

This research clarifies the impact of modern technologies on legislative development, emphasising the urgent need to make legal language more accessible and promote the right to legal knowledge for the general public. It also demonstrates artificial intelligence's ability to address the challenges associated with the quality of legal drafting.

This study aims to explore ways in which AI can enhance the quality of legislation. It also seeks to examine tools that use artificial intelligence to simplify and clarify legal language, evaluate their efficiency within legal systems, define the limits of their application and offer practical suggestions for integrating artificial intelligence into the legislative process.

The research hypothesises that the quality of legal texts can be improved and rates of ambiguity and repetition reduced through the use of artificial intelligence. By simplifying legal language, individuals can more easily understand their rights and obligations, including those relating to social life, access to justice, and the integration of AI technologies into the legislative process. Achieving these objectives requires a more flexible and up-to-date legal environment.

Previous studies have varied in their research into the relationship between artificial intelligence and the law. Some studies have examined the judicial use of artificial intelligence, such as in digital justice, while others have focused on the use of artificial intelligence mechanisms in smart contracts or legal assistance. However, very few of these studies have focused on improving the quality of legislation or simplifying legal language through artificial intelligence. Therefore, the limited existing research justifies the urgent need to address this gap through this study.

Based on the above, the following problem can be raised:

To what extent can artificial intelligence improve the quality of legislation and make the language of the law more accessible, while maintaining accuracy and legal reliability?

To answer this question, we took a descriptive analytical approach, examining relevant legal and technical literature and analysing the experiences of other countries that have started using artificial intelligence in legislation. We divided this study into two topics:

The first topic is: The conceptual framework of artificial intelligence; the quality of legislation; and the language of the law.

The second topic: The role of artificial intelligence in improving the quality of legislation, simplifying legal language, and the challenges it faces.

The first topic: The conceptual framework of artificial intelligence, the quality of legislation, and the language of the law.

Artificial intelligence has recently become relevant to many fields, such as the economy, trade, the media and scientific research. However, perhaps the field of law has not yet adopted artificial intelligence to the same extent as other fields. Artificial intelligence can be exploited in several ways in the field of legal sciences, including improving the quality of legislation and facilitating the language of the law so that individuals can understand various legal texts. To understand this subject, it is necessary to define artificial intelligence and its types and tools, and then to learn about the quality of legislation and legal language.

The first step is to define artificial intelligence and its various forms.

The modern world has experienced a revolution in information technology, which has spread to all fields, including medicine, engineering, economics, and scientific research. The most prominent development in this

progress is the emergence of technologies that rely on data analysis and simulate the human mind, or artificial intelligence. These technologies help solve complex problems.

Section one: Definition of artificial intelligence

Artificial intelligence (AI) is the simulation of human cognitive functions such as understanding language, thinking and problem-solving, as well as the ability to make decisions. Systems with artificial intelligence exhibit behaviours similar to human logical thinking, as well as the ability to learn from experience and perform tasks independently. Artificial intelligence relies on algorithms and tools that aim to complement or compensate for human work through a set of technologies that simulate human intelligence. Thus, artificial intelligence becomes both a method and a form of technological progress.[1]

Artificial intelligence is one of the most transformative technologies of the modern era. It's also one of the most rapid technology disruptions ever. The term artificial intelligence originated in 1956 at a scientific conference at Dartmouth College. One of the founding pioneers of artificial intelligence, Marvin Minsky[2], described it as "the science of making machines do things that require intelligence if done by men."

It is clear that artificial intelligence is a modern technology based on analysing data presented to it. It is a simulation of the human mind and is sometimes superior to humans in terms of accuracy and speed of results. Perhaps the most notable applications of artificial intelligence are ChatGPT, the renowned Chinese website Deepseek and the Grok tool, to name a few. Thus, artificial intelligence has become software that simulates activities such as learning, inference, and perception. However, AI is constantly developing, with scientists having developed systems that exceed human ability to learn and think about any topic.

The most significant aspect of AI is its ability to analyse data and take actions that increase the likelihood of achieving a specific goal. Machine learning is a subfield of AI that enables software to learn from new information without human intervention. Methods of deep learning, such as those applied to texts, images, and videos, will aid automatic forms of learning that revise large volumes of unstructured data.[3]

The scope of artificial intelligence is to understand cognitive skills using computational models that represent them, and to create machine intelligence that can perform human tasks more efficiently.

Section Two : Types of Artificial Intelligence

Thanks to recent advances in artificial intelligence research, we are getting closer to having smart, conscious devices. These are machines that can understand spoken commands and recognise images. There are different types of artificial intelligence, which are classified according to ability or purpose. In this study, we will only explain the types of artificial intelligence classified according to their purpose, of which there are four:

Interactive artificial intelligence:

[1] Moumita Ghosh and Thirugnanam Arunachalam, 'Introduction to Artificial Intelligence' in Srinivasa K G and others (eds), Artificial Intelligence for Information Management: A Healthcare Perspective (mai 2021) 23 <https://doi.org/10.1007/978-981-16-0415-7_2 > accessed 5 February 2025

[2] Marvin Minsky (August 9, 1927 in New York, USA — January 24, 2016 in Boston, Massachusetts) was an American mathematician and computer scientist, and one of the best-known practitioners of artificial intelligence (AI). Minsky won the AM race in 1969. The Turing Award , the highest honor in computer science, for his pioneering work in the field of artificial intelligence.

[3] Ahmed Ibrahim Hassan Ali , "The Future of Higher Education in Light of Artificial Intelligence - Global Innovation Index 2022 and Iraq's Location therein " (2025) 4(1) (S. J .E .D) 1,6

This type is considered the oldest and simplest, as its systems are limited to interaction only, with no ability to form memories or learn from previous experiences when making decisions. IBM's Deep Blue chess software is a perfect example of this category.[1]

Therefore, this intelligence relies on identifying the available pieces, anticipating possible moves and selecting the best one. Therefore, we can see how effective interactive systems are at performing basic functions by reading and responding to stimuli.

2- **Artificial intelligence with limited memory:**

It can store data and information, as well as predictions based on previous information. This enables machines with limited memory to use historical data in decision-making processes. Examples include study robots, instant messaging apps and virtual assistants on smartphones.[2]

3- Theory of Mind-based Artificial Intelligence:

This genre is highly sophisticated, not only simulating the real world, but also interacting with it and understanding the individuals, creatures and objects within it. It recognises that each entity has feelings and emotions that affect them. This is important for the development of societies, as it enables AI systems to understand human feelings and behaviours, allowing them to interact accordingly.[3]

4- Self-conscious AI:

Despite their lack of presence on the ground, machines in this genre have self-awareness and special feelings, making them more intelligent than humans. Many countries are competing for access to this cutting-edge technology, as it is the focus of competition in this area.

The second requirement: Defining the quality of legislation and simplifying the language of the law

Like any act of the authorities, laws must be based on sound reasoning and future studies must be aimed at achieving clear and specific objectives. This is why it is important to measure the impact of laws and assess their quality, in order to understand how effective the legal text is at addressing the issues it was developed to tackle. The quality of laws and the clarity of their language are essential for the effectiveness and legitimacy of the legal system. Legislative texts are not merely written statements; they are means that can be used and understood to achieve the required objectives at the lowest possible social and economic cost.

Section one : What is meant by the quality of legislation

The quality of legislation is considered an effective means of measuring and analysing the impact of new legislation. This can be achieved by considering the views of experts and conducting surveys of citizens, as well as understanding the potential impact on those involved in the legislative process. Ultimately, parliament makes the decision and determines the final version of the legislation. The methodology for measuring the quality of legislation dates back to the mid-1970s in the United States, where it was initially used to assess the effects of inflation. It has since been adopted by countries such as Finland and Canada as a structured method that includes a cost-benefit analysis. The United Kingdom began using the measurement of legislative impact in the

[1] Kawthar Mansel, "*The Role of E-Governance in Algeria: Towards the Emergence of a Law for E-Governance*" (PHD thesis , University, 8 May1945 Guelma, Algeria 2023) 482.
[2] Omar Abbas Khudair Al-Obaidi, *Contemporary Applications of Crimes Caused by Artificial Intelligence: Legal Study in the Perspective of International Law* (Arab Center for Publishing and Distribution, Cairo, Egypt, 2022) 46
[3] S Preethi , "A Survey on Artificial Intelligence"(2020) 3(2) (IJICT) 39,41

mid-1980s. By the second half of the 1990s, this methodology had become popular, with around half of the EU's members adopting the legislative quality standard by 1996.[1]

The concept of quality in law relates to three main aspects: the form, content and function or purpose of the law. Jurists have found that formal and substantive integrity alone is insufficient to ensure the quality of legislation. Instead, the law must emphasise its intended function, centred on achieving social stability, ensuring justice and equality, protecting rights and freedoms, facilitating the investigation of social progress, and ensuring legal security. All of these factors contribute to the pursuit of the public interest.

We can say that the quality of laws indicates how well legal texts achieve their objectives efficiently and effectively. To ensure easy implementation and justice, we must also take into account clarity, accuracy, and compatibility with other laws.

The quality of legislation refers to how effectively it is prepared. This quality is measured by a number of factors, the most important of which is studying the effects and possible consequences of its application. It also involves anticipating the results and discussing possible implementation alternatives. The quality of legislation index is one of the World Bank's indicators, measuring legislators' ability to prepare high-quality policies and laws. Legislative quality is divided into two aspects: the first relates to the legislative policy itself and its outcomes, while the second mainly relates to the quality of legislative drafting.[2]

Therefore, it can be said that the quality of legislation is one of the most important things that legislators seek when drafting laws, in order to achieve their goals and ensure legal security. This can only be achieved by using mechanisms such as clarity, accuracy, compatibility and consistency, and by ensuring that legislation does not conflict with existing state or international laws. Legislators must also be familiar with all issues related to legislation.

Section Two : What is meant by the language of the law

Everyone has their own way of expressing themselves, and it is widely accepted that the law has its own unique methods that can only be mastered or understood by those who study it. The first reading of any legislation makes this clear, as it uses specialised language that may or may not convey meaning. The law is certainly considered both a science and an art, requiring legislators to devise legal rules using the available methods.[3]

It cannot be ignored that drafting legislation requires accuracy, specialisation and intelligence. The legal sciences stem from the social sciences relating to reality. However, legislators must achieve the goals set at the heart of the legal rules they write. This can only be achieved if the legal rules are clear and unambiguous, facilitating their application and thus achieving their purpose.

This goal is achieved through effective legal drafting. While it is true that legal language is generally difficult to understand, this does not mean that it is complex to apply. It is simply a specialised language that includes a mixture of words, some of which are taken from everyday language and contain synonyms that the general public understands. These words are transformed into a specialised language that conveys precise and specific meanings that are not open to interpretation and are only understood by specialists. Therefore, it is considered a language that expresses accurate concepts in a specific scientific field or discipline.[4]

---

[1] Karim Sayed Abdul Razzaq," Methodology for Measuring the Impact of Legislation among International Practices and Experiences and the Requirements of Application in the Arab Countries"(2018) 3(6) (Scientific Journal of the Faculty of Economic Studies and Political Sciences) 41 ,50

[4] Zahra Abdel Baqi, "*Problematic Translationof the Terminology of the Algerian Nationality Law*", (LLM thesis , Abu Bakr Belkaid University Tlemcen (2015) 19

Therefore, it can be said that legal language differs from other types of language and is sometimes shrouded in ambiguity, making it difficult for those addressed to understand its meaning. This is particularly true in the Algerian legal system, where texts are issued in French and then translated into Arabic. Consequently, the meaning of certain legal terms or vocabulary may differ from one law to another. It is therefore clear that there is a need to use artificial intelligence to simplify this language and make it more accessible to individuals. From this standpoint, the law can be better understood by non-specialists, increasing trust and transparency in the legal system and reducing judicial disputes resulting from a misunderstanding of the law, thus improving voluntary compliance with it.

The second topic: The role of artificial intelligence in improving the quality of legislation, simplifying the language of law, and the challenges it faces

Artificial intelligence is considered one of the most important aspects of digital transformation in the twenty-first century, as its applications have begun to expand into various fields, including law. In particular, it is being used to draft legislation and make legal language more accessible. Currently, artificial intelligence techniques can be used to analyse legal documents, predict the outcomes of legislation and suggest improvements to make legal formulas more accurate and clear. However, there are disadvantages and obstacles to achieving the desired and expected results.

The first requirement: The role of artificial intelligence in improving the quality of legislation and simplifying the language of the law

The difficulty of understanding legal language and the ambiguity of laws are challenges that hinder the achievement of justice and put pressure on the judicial system. Artificial intelligence offers innovative solutions to these issues.

Section I : The Role of Artificial Intelligence in Improving the Quality of Legislation

Thanks to rapid advances in artificial intelligence, the world is undergoing significant change in many respects. Notably, this change has not only affected technical and industrial fields, but also begun to impact other areas such as the drafting and simplification of laws. From there, artificial intelligence has tremendous potential to influence the preparation and implementation of legislation, resulting in more effective laws that achieve the greatest degree of justice and efficiency. AI may also improve the quality of legislation by employing key methods and approaches.

1-Big Data Analysis:

This involves collecting, organising and examining large amounts of information related to the law, such as judicial rulings, contracts and legal correspondence. Artificial intelligence, machine learning and deep learning techniques are then used to discover patterns, make predictions and gain insights.

AI techniques, especially machine learning, can quickly and accurately process this information, allowing patterns to be detected and gaps, inconsistencies, or repetitions in existing laws to be identified. This gives legislators important ideas for improving drafting and avoiding problems.

For example, in the future, systems could study how a particular law affects different groups in society based on previous data, which would make it easier to formulate fairer laws.[1]

Machine learning algorithms are well-known for their ability to repeatedly build useful models of complex phenomena by detecting patterns and inferring rules from data. This feature enables legislators to use machine learning technology to filter large quantities of documents and data contrary to the Constitution, for example,

[1] Kevin D Ashley, *Artificial Intelligence and Legal Analytics: New Tools for Law Practice in the Digital Age* , (Cambridge University Press 2017) 234

and identify the most effective ones. This saves time on tasks that likely require high-level legal skills, making legislative work more effective and efficient.

This technology is significant because it can accomplish a number of objectives, chief among them being the enhancement of the process of reaching the best legal conclusion. It can also assist in forecasting the results of various cases. As well as supporting litigation strategies, this tool can be used to evaluate the conduct of judges and attorneys. These technologies save time and effort by quickly processing large amounts of data. They also help to detect gaps in laws and regulations and address them. The more that lawmakers use this technology, the better the laws will be, as they will be free of loopholes and inconsistencies. This technology can also predict potential conflicts and their consequences based on previous data.

1- Drafting and Amending Legal Document

Advanced natural language processing technologies [1] (NLP) can contribute to the preparation of initial drafts of laws, clauses or amendments. By studying available legal texts and extracting linguistic and legal patterns, artificial intelligence can generate accurate and consistent formulations, reducing the risk of human error and saving time. These tools can also review texts to ensure that they are free from ambiguities, contradictions and grammatical or spelling errors that could lead to inaccurate interpretations.

AI can be used to improve efficiency and save time. Tools such as ChatGPT, Copilot, Claude, Harvey, Ironclad and Luminance allow you to create contractual drafts in minutes rather than hours. These tools can also reduce errors by detecting linguistic and grammatical errors early on, making it easier to make modifications and unify legal language to avoid conflicts.

2- Predictive Analytics of Legislative Impact:

One of the key functions of artificial intelligence is its ability to predict the potential outcomes of new legislation before it is enacted. Using sophisticated simulation models, AI can analyse the impact of new laws on the economy, society, the environment and specific areas. Legislators can use these predictions to make informed decisions and amend laws to minimise negative impacts and maximise positive benefits. For instance, the effect of a new tax law on employment or investment ratios could be determined.

Artificial intelligence relies on models that simulate previous data, such as previously implemented laws, to predict the outcomes of new legislation in areas such as elections, the media, and criminal law. These models act as digital twins of communities, helping legislators to understand the effects of different legal options in real time before they are approved. AI tools can also scan legal texts to automatically match them to applicable local or global laws and immediately highlight issues such as inconsistencies with international treaties. Additionally, AI tools analyse legislators' behaviour and voting patterns, accurately predicting the results of deputy voting. Systems such as the "Political Actor Agent" use LLMs to simulate legislative behaviour and interpret voting decisions in a way that is clear and understandable to humans.[2]

The UAE's Regulatory Intelligence Office has set up a government unit that uses artificial intelligence to monitor the impact of laws and suggest regular updates, speeding up the legislative process by up to 70%. The UAE was the first country to use AI to help draft new legislation and review and amend existing laws. [3]

---

[1] Natural language processing (NLP) is a branch of artificial intelligence which enables computers to understand, generate and process human language. NLP can interrogate data using natural language, whether text or sound. It is also referred to as 'language'. Most consumers may interact with natural language processing without realising it. For example, it is the core technology behind virtual assistants such as Oracle Digital Assistant (ODA), Siri, Cortana and Alexa.

[2] Hao Li, Ruoyuan Gong, Hao Jiang . "Political Actor Agent: Simulating Legislative System for Roll Call Votes Prediction with Large Language Models "(dec 2024) < https://arxiv.org/abs/2412.07144> accessed 10 February 2025

[3] Chloe Cornish, "UAE set to use AI to write laws in world first published "(Apr 20 2025) ,< https://www.ft.com/content/9019cd51-2b55-4175-81a6-eafcf28609c3 > accessed 22 apr 2025

3- Compliance Monitoring and Enforcement

The function of artificial intelligence extends beyond drafting to include monitoring compliance with and application of current laws. Smart systems can track transactions, activities or actions to ensure compliance with laws and regulations. This is particularly important in areas such as anti-money laundering, financial market regulation, and information protection, where large volumes of data need to be monitored.

4- Identifying Legislative Gaps:

Artificial intelligence can examine legal texts and legislative precedents to identify areas with a lack of legal regulation or inconsistent laws. This technology enables legislators to determine priorities in advance and identify legislative gaps. AI can also identify legal gaps in areas not covered by the law. It can discover duplicates or differences between legal texts and distinguish between similar legislation and laws. By identifying these gaps, they can be addressed through jurisprudence. AI can also compare a country's laws with those of similar countries to identify areas not regulated by local laws but regulated by other legal systems. This helps legislators to propose new legal articles or amend existing ones.

Section Two : The Role of Artificial Intelligence in Simplifying the Language of the Law

It is noteworthy that some legal texts are not devoid of complexity, and thus there is a need for technologies that can simplify these texts to make them clearer for non-specialists. From this standpoint, artificial intelligence emerges as an effective solution to this problem, removing the linguistic and cognitive barriers that prevent understanding of different legal texts and enhancing transparency and access to justice.

Legal language suffers from structural and technical deficiencies, making it less accurate and harder to understand than ordinary English. This deficiency is mainly due to the incorrect use of language by many legal professionals, including incorrect spelling and punctuation. Professional culture also contributes to the spread of ambiguous and grandiose expressions by relying on complex phrases that do not always lead to effective and clear communication.[1]

Legal formulations often tend to be repetitive and use excessively long words instead of the most accurate ones, which causes confusion for the reader and reduces the clarity of the text. While lawyers themselves often struggle to read and understand legal texts, the situation is further complicated for non-specialists, particularly in China.

One reason for the complexity of legal language may be the long grammatical structures and complex or sometimes ambiguous sentences, as well as the Latin words and old terms that have only recently been amended. For example, the General Administrative Conditions Book, which applies to public works contracts, is a prime example of this. It was issued in 1964 and remained in force until the new conditions book was issued in 2021. The old law contained terms that were no longer in circulation at the beginning of the millennium, as well as references to legal centres that no longer exist. This makes it difficult for non-specialists to access justice. Legal texts for non-students may be difficult to understand, forcing people to consult specialists or lawyers for advice, which costs money. Therefore, it is clear that artificial intelligence tools are needed to simplify legal language.

1. Analysis and understanding of legal texts:

Artificial intelligence systems that use natural language processing are particularly effective at analysing large amounts of legal text. These systems can identify basic legal concepts, extract technical terms and understand the links between different paragraphs and articles. For instance, deep learning algorithms can learn the exact legal meanings of terms by analysing millions of legal documents, which helps to clarify them.

[1]David Mellinkoff , " the language OF the Law" (1964) 63(1) (michigan law review)180,182

They can also reveal complexity and ambiguity. AI can identify long and complex sentences and unclear legal terms that may confuse the average reader.

They can also classify and compile data. Legal documents are classified based on their content and information related to a specific topic is compiled, making it easier for people to find what they need and presenting it in simpler language.

2. Machine translation and simplification of wording

The most important feature of artificial intelligence-based translation tools is that they effectively convey the meaning of legal texts, which often contain complex terms that are difficult for the general public to understand. These tools can transform such texts into simpler language while maintaining the necessary legal accuracy. This technique is not limited to translating between languages; it also simplifies legal texts within a language, making it more effective in this regard.

Large Language Models (LLMs): Like GPT-4, they can paraphrase complex legal paragraphs in a simplified, understandable manner while preserving the original legal meaning.

These models demonstrate their ability to simplify complex legal paragraphs by reformulating sentences without altering the legal meaning. They can also explain legal terms in plain language to non-specialists while maintaining the required accuracy in the legal context. This is important because laws are usually written in difficult or technical language, making them hard for people to understand. This affects people's ability to recognise their rights and responsibilities.

As an example, we mention what is stipulated in Article 144 bis 2.[1] When it is reformulated by the LLM model such as GPT-4, the wording becomes "Jinn shall be punished for a period ranging from two to five years and a fine of up to half a million dinars for anyone who infringes in any way on the Prophet Muhammad, peace be upon him, or other prophets , or ridicules the well-known and basic teachings of Islam through speech, writing, drawings, or any other means.

Through this formulation, we can see how the language has been simplified while retaining the fundamental meaning. Some terms, such as those from the field of religion, have necessarily been clarified, and the method has been changed so that it is clear to readers who are not specialists in law.

It can also generate executive summaries: Artificial intelligence can produce short summaries of long legal texts, helping individuals and companies identify the main points without reading the entire document.

3. Create virtual paralegals (Chatbots)

AI-powered legal aid is an interactive way to facilitate understanding of the law. These chatbots can respond to users' questions in simple language, provide general legal advice, and direct users to the appropriate legal resources.

They provide immediate information and people can ask questions in their own language and receive accurate, easy-to-understand responses based on original legal texts, without having to understand difficult terminology.

They can also explain legal concepts. These robots can clarify difficult legal concepts by presenting real-life examples or situations through microdirectives. This model transforms general legislative goals into specific,

[1]Algeria, Law No 01-09 of 26 June 2001 amending the Penal Code, Official Gazette of the People's Democratic Republic of Algeria, No 39 (27 June 2001), art 144 bis 2: "Anyone who offends the Prophet (peace be upon him) or the rest of the prophets or mocks what is known of the religion necessarily or any ritual of Islam, whether through writing, drawing, declaration or any other means, shall be punished by imprisonment from three (3) years to five (5) years and a fine from 50,000 DZD to 100,000 DZD, or one of those two penalties only."

situation-based executive orders, communicating via smart systems and sophisticated technologies. Traffic laws are a good example of this concept, with general rules being replaced by flexible directives that suit actual conditions. These guidelines help to increase compliance with the law by simplifying complex standards into easy-to-follow instructions, thereby improving the efficiency and flexibility of the legal system.[1]

One of the most prominent artificial tools in the legal field is the robot lawyer, an AI program that performs legal tasks traditionally undertaken by human lawyers. This type of lawyer has recently emerged and works under the supervision of a human lawyer, assisting with legal research, electronic discovery and contracting. This helps people to manage legal and administrative matters easily and effectively. However, the problem of determining who will be responsible for errors, malpractice or other damages caused by autonomous robot lawyers remains.[2]

The advantages of using legal chatbots include simplifying legal language by rephrasing information in a way that the average person can understand, and increasing access to justice. Citizens who cannot afford to hire a lawyer can access a free initial consultation, which helps to relieve pressure on judicial institutions by filtering out simple enquiries and ensuring that cases requiring human intervention are dealt with accordingly. Virtual assistants are also available 24/7 and never tire.

The second requirement: Legal and ethical challenges

Using artificial intelligence to improve the quality of laws and simplify legal language could increase the effectiveness and efficiency of legal systems. However, this application raises a number of legal and ethical issues that must be thoroughly examined to ensure these technologies are used responsibly and fairly.

Section one : Legal Challenges and Concerns

Although artificial intelligence provides many services in the field of law, such as improving the quality of legislation and simplifying legal language, this area is not without its challenges.

1. Legitimacy of AI-assisted law-making processes

Contrary to some people's belief in the perfection of artificial intelligence systems, practical experiments have shown that artificial intelligence, whether in the form of algorithms or self-operating intelligent systems, is not error-free. Additionally, there are privacy and security issues because these systems' algorithms rely on sensors to collect large amounts of information. Furthermore, AI can commit errors and infractions that amount to crimes.

Current artificial intelligence excels at tasks requiring clear patterns and specific or semi-specific structures, but faces significant challenges with conceptual or intangible issues, matters requiring human values, judgements, or an understanding of social and political conditions. Given these limitations, it is evident that the processes involved in drafting legislation, which require abstract thinking, value analysis and policymaking, currently surpass the capabilities of artificial intelligence. [3]

2-The problem of intelligence accountability and the ambiguity of legal adaptation

The question of accountability for decisions or outcomes resulting from AI is a complex legal issue. When mistakes or unacceptable results occur, who should be held accountable? Should it be the developer of the artificial intelligence, the user, or the system itself? Ultimate power and responsibility for decisions must remain with humans to ensure respect for human values and legal expertise.

[1] Anthony J. Casey ," The Death of Rules and Standards" (2017) 92 (4) (maurer shcool of law indiana law journal) 1401,1410

[2] Michael Loy , "Legal liability for artificially intelligent “robot lawyers ”" (2022) 26 (3) (L & C L R) 951.951

[3] Harry Surden , " Artificial Intelligence and Law"(2019) 35(4) (G. S. U. L .R) 1305,1335

Some researchers believe that the evolution of AI systems, especially those that exhibit new behaviour as a result of their interaction with other systems, poses a significant challenge to traditional civil liability laws. When it is difficult to predict the behaviour of these systems, particularly when several independent systems are working together, establishing legal responsibility for damages can be challenging or even impossible. Consequently, the law of damages may evolve towards a preventive approach that emphasises risk reduction and advance preparedness as a more effective means of ensuring legal protection in an increasingly uncontrollable technological world.[1]

Algorithms are typically used to aid or substitute human analysis for decision-making purposes, to improve decision quality, or to perform actions. The decision-making process can be fully automated or hybrid, requiring human intervention for review. In the public domain, however, the algorithms usually used tend to guide human decision-making rather than making final decisions completely independently.[2]

The development of autonomous AI systems has prompted global efforts to regulate the responsibility of such systems. For example, on 20 October 2020, a decision was issued containing recommendations for the Commission on the system of civil liability associated with artificial intelligence. The European Parliament has also reversed a previous resolution. [3], It was made clear that, for the time being, legal personality should not be granted to autonomous regimes.

Therefore, as can be seen from the above, there is a difference in opinion regarding the legal status of artificial intelligence tools and their accountability for any damage resulting from their use. It is important to research the potential consequences of establishing a specific legal status for the most sophisticated smart systems, including limiting electronic personalities to instances where robots make independent decisions or interact with third parties autonomously. Therefore, concepts must be controlled through orders and the analysis of data carried out by artificial intelligence, as well as its intervention in legislation and the simplification of laws. A legal framework must be established to determine the legal status of artificial intelligence and the extent to which it is subject to liability.

3-The problem of intellectual property:

One of the issues raised by the use of artificial intelligence in the legislative process or the simplification of legal language is who owns these laws. When artificial intelligence is used to prepare draft legislative texts, or to simplify or explain legal texts, can artificial intelligence be considered the author of these laws? How are current intellectual property laws applied to content produced by artificial intelligence? Ambiguity in this area can hinder innovation and result in legal disputes. Important legislation is needed to study all cases of artificial intelligence being used in legislation and attribute it to the relevant legislative body. Thus, legislation and regulations will decide whether the results of artificial intelligence are subject to intellectual property rights.

Section Two : Moral Constraints

In recent years, there has been a rapid increase in the use of AI in various fields, including law. AI techniques are being used to write laws, understand legal texts and make legal language clearer for everyone. This progress has raised important ethical questions about the extent to which AI is used in law-making, given

[1]Ryan Calo , "Robotics and the Lessons of Cyberlaw " (2015) 103 (California Law Review) 513 ,558

[2]Busuioc Madalina," Accountable artificial intelligence: Holding algorithms to account"(2020) 81(5) (Public Administration Review) 825 , 828

[3]On 16 February 2017, the European Parliament passed a resolution directing recommendations to the Civil Law Rules Committee on robotics. The resolution requests that the Commission establish a clear legal framework to regulate the development of robots, including autonomous systems and intelligent robots. Several new legal descriptions of robots have been created as a result, such as 'non-human electronic deputy', which denotes a robot that becomes part of a person's identity, and 'human deputy', which refers to the person responsible for errors that occur during the operation of the robot. The resolution also called for advanced autonomous robots to be granted legal status as cyberpersonas.
.See : European Parliament, 'Resolution of 16 February 2017 with recommendations to the Commission on Civil Law Rules on Robotics (2015/2103(INL))' [2018] OJ C252/239.

the importance of this field and its direct impact on individuals' rights and societies' interests. Among the most prominent ethical challenges facing the use of AI in the legislative process are:

1-Algorithmic Bias:

It is certain that artificial intelligence systems are trained using huge amounts of data. If this data contains historical biases or special ideologies that benefit a certain social group, or express their opinions and ideas, then artificial intelligence may reflect these factors in its answers and proposals. For example, in the legislative process, bias can cause an algorithm to propose discriminatory laws that benefit a certain group at the expense of another, or to legislate laws that do not represent all segments of society, but rather serve an ideology, belief or set of ideas that meet the needs of the legislator. This results in a deficient legal base in general, and in rights being achieved by ignoring the needs of other groups in society, thus striking at the core principles of justice and equality.

A clear example of this is Amazon's e-commerce specialists' recruitment algorithms used to hire software engineers. The data entered lacked fairness because it favoured the employment of men at the expense of women because it was trained on biased historical data. Ultimately, Amazon stopped using algorithmic hiring decisions.[1]

2. **Privacy and data sovereignty**

Privacy is the right to control one's personal information and private data. When artificial intelligence is adopted in legislation, data relating to individuals or organisations, such as legal precedents or social and economic information, can be used to estimate the impact of laws. It is therefore essential to ensure that the collection and processing of this data complies with robust data protection principles, such as minimising the amount of data collected, setting clear objectives, being transparent, maintaining data integrity, and ensuring accountability. Individuals must also have the right to access, modify and delete their information, request limitations on the processing of this data, and object to its use in automated decision-making processes.

3-**Transparency, neutrality and integrity**:

The data, systems and business models associated with artificial intelligence systems must be transparent so that they can be understood by stakeholders. People should be aware that they are dealing with an AI-based system, and they should also be informed of its capabilities and limitations. This principle requires data processing methods to be facilitated and presented in a simple, easy-to-understand manner so that they can be audited by community entities or censored.[2]

In addition to cybersecurity, artificial intelligence systems require large amounts of data. This makes them attractive targets for cyber attacks. Therefore, the security of these systems must be strictly regulated to protect sensitive data from intrusion. Although artificial intelligence can be a powerful tool in the legislative process, simplifying the language of the law by processing huge amounts of data in a very short time, its results are sometimes inaccurate. Therefore, the human element must be monitored, making the role of the legislator pivotal in the legislative process.

Conclusion:

Artificial intelligence is an important element in the development of legal systems. It is no longer just a technical tool; it is also a strategy aimed at increasing the efficiency of legislative processes and achieving justice through clearer and simpler legal language. This study has shown that AI can have a positive impact on the

[1] Köchling Alina, Marius Claus Wehner," Discriminated by an algorithm: a systematic review of discrimination and fairness by algorithmic decision-making in the context of HR recruitment and HR development "(2020) 13 (3) (Business Research) 795 ,796

[2] Kawthar Mensal "*The Role of E-Governance in Algeria: Towards the Emergence of a Law for E-Governance* "(n 1) 512

legislative industry by improving the quality of legal texts, identifying duplicates and inconsistencies, promoting inclusivity and simplifying legal language while ensuring accuracy and preserving content.

Despite its great benefits, artificial intelligence technology faces several ethical and legal challenges. These challenges include its liability in the event of harm and the ambiguity surrounding its legal adaptation.

AI also analyses thousands of legal texts to identify duplicates, inconsistencies and loopholes. It also suggests more precise and practical formulations, thereby raising the quality of new legislation. Additionally, natural language processing techniques simplify complex legal texts, making them easily understandable to non-specialists and supporting the principle of 'law enforcement', thereby strengthening citizens' confidence in the legal system.

Furthermore, AI reduces the time and effort required for analysing and drafting legislation, helping to speed up the legislative process without compromising quality. Despite these advantages, artificial intelligence still faces legal ambiguity regarding liability for damages resulting from legislative or interpretative recommendations. Additionally, the ambiguity surrounding its legal assessment raises questions about who is responsible for errors (whether the legislator, programmer or system itself).

Based on these results, the following recommendations can be made:

- Enact national legislation to regulate the use of AI in legislation.

- The need for continuous human oversight of the outcomes of AI in legal matters.

- Conduct a permanent ethical review of any legal system based on artificial intelligence through specialised committees.

- Promote diversity in teams that develop algorithms to reduce bias.

- Qualify legislators and legal specialists in the principles and ethics of artificial intelligence by integrating artificial intelligence into legal education.

Abstract

China's industrial structure has undergone profound transformation in recent decades, shifting from a reliance on labor-intensive production to innovation-driven and high-tech sectors. This restructuring has reshaped the country's external economic relations, particularly with the Eurasian Economic Union (EAEU), a regional integration bloc that serves as a strategic partner for China. This study examines how China's industrial upgrading influences bilateral trade dynamics and the development of technological cooperation mechanisms with the EAEU member states. Using a multidisciplinary approach combining trade statistics, policy analysis, and case studies of collaborative projects, the paper highlights the evolving complementarities between China's advanced manufacturing and digital economy sectors and the EAEU's energy, raw material, and transit advantages. The findings suggest that industrial adjustment in China stimulates demand for diversified imports, while also promoting the export of high-value-added goods and services. Additionally, the transition toward green and digital industries has fostered new platforms for scientific collaboration, infrastructure development, and technological innovation across Eurasia. However, the research also identifies challenges, including regulatory disparities, unequal technological capacities, and geopolitical tensions that may impede the depth of cooperation. Overall, the study argues that the modernization of China's industrial structure is both a driver and a test for the sustainable growth of China–EAEU economic and technological relations, with long-term implications for regional integration and global value chain participation.

Introduction

The rapid evolution of China's industrial structure represents one of the most significant economic transformations of the 21st century. Beginning with the "Made in China 2025" strategy and subsequent innovation-led policies, the country has prioritized upgrading its production base, moving away from low-cost

manufacturing toward high-tech, digital, and green industries. This industrial adjustment not only supports China's domestic goals of sustainable development but also has far-reaching consequences for its international economic partnerships.

The Eurasian Economic Union (EAEU), established in 2015 and comprising Russia, Belarus, Kazakhstan, Armenia, and Kyrgyzstan, has become an essential strategic partner in China's broader Eurasian engagement. As part of the Belt and Road Initiative (BRI), cooperation between China and the EAEU extends beyond traditional trade to encompass infrastructure development, digital connectivity, and joint technological innovation. While the EAEU primarily exports energy resources, agricultural products, and raw materials, China increasingly exports machinery, consumer electronics, and advanced technological solutions. This complementarity is now evolving into more sophisticated interdependence as China's industrial priorities shift toward innovation-driven growth.

The transformation of China's industrial structure also aligns with global megatrends such as the green economy, digitalization, and regional supply chain integration. For the EAEU states, this transition offers opportunities to attract Chinese investment, modernize their industries, and participate in cross-border innovation networks. At the same time, disparities in technological capabilities, divergent regulatory frameworks, and external geopolitical pressures pose challenges to deepening cooperation. Understanding these dynamics is critical for policymakers and scholars seeking to evaluate the long-term prospects of China–EAEU trade and technological collaboration.

This paper explores the implications of China's industrial restructuring for trade and technology cooperation with the EAEU, analyzing both opportunities and constraints. By situating the analysis within the broader context of regional integration, the study contributes to debates on how structural economic change can reshape international partnerships in the age of globalization and multipolarity.

Main Body

As a key partner of the Eurasian Economic Union, China has always maintained close economic and trade ties with EAEU member states. On May 17, 2018, the Kazakhstan-Astana Economic Forum was held. Attendees included China's Deputy Minister of Commerce and international trade negotiator Fu Ziyin, Chairman of the EAEU Executive Committee Serge Sargsyan, and representatives of EAEU member states. During this meeting, delegates signed the Agreement on Economic and Trade Cooperation between the People's Republic of China and the Eurasian Economic Union. The agreement includes 13 chapters covering customs cooperation, trade facilitation, intellectual property rights, sectoral cooperation, and public procurement. This agreement represents the first major institutional agreement in the trade and economic sphere between China and the EAEU (EAEU, 2018).

For a long time, the economic activity of China and the EAEU has been influenced by global commodity price fluctuations. Rapid development of China's manufacturing sector, especially over the last decade, has sharply increased China's demand for raw materials. In recent years, China's economy has begun to transform, eliminating some outdated industries and production methods, particularly low-tech raw material processing industries.

One goal of China's industrial restructuring is to reduce reliance on fossil fuels and improve energy utilization. In 2020, China's consumption of clean energy—such as natural gas, hydro, nuclear, and wind energy—accounted for 24.3% of total energy consumption, an increase of 1.0 percentage point from 2019 (National Bureau of Statistics of China, 2021). For example, in 2020, China's installed power generation capacity included:

- Thermal power: 1,245.17 million kW
- Hydropower: 370.16 million kW
- Nuclear power: 49.89 million kW
- Grid-connected wind power: 281.53 million kW

- Grid-connected solar power: 253.43 million kW

These data indicate China's significant investment in clean energy sectors requiring relatively high technological innovation, such as solar and wind energy. China continues to increase investment in energy structure reforms, steadily raising the share of new energy.

EAEU Exports and Trade with China

Currently, EAEU member state exports mainly consist of fossil fuels and raw materials. Most exports to third countries are mineral commodities: approximately 75% in Kazakhstan, 66% in Russia, and 47% in Belarus. Among goods exported by EAEU members to third countries, mineral products account for 60.6%, metals and manufactured metal products 10.5%, and chemical products 6.7%. Russia is the main exporter of these goods to external markets, accounting for roughly 80% (EAEU, 2020). The trade content between China and the EAEU falls largely within these categories.

According to Chinese customs data from 2017 to 2021, trade between China and EAEU countries remains dominated by primary industrial goods and raw materials (see Table 1). The trade primarily consists of light industrial products and raw materials. By 2015, the share of non-raw exports in total EAEU exports had steadily increased. By 2016, non-raw goods accounted for 56.9% of EAEU exports, while raw goods accounted for 43.1% (EAEU, 2016).

This indicates considerable potential for expansion into high-tech consumer markets and highlights the mutual technological innovation shortcomings of both sides. There remain ample opportunities for R&D collaboration and the production of high-tech goods with independent intellectual property rights and market demand.

Table 1: Main Categories of China's Foreign Trade with EAEU Countries

Country	Main Exports from China	Main Imports to China
Russia	Mobile phones, fur clothing, portable data processing equipment	Oil, bituminous minerals, logs, unalloyed nickel
Belarus	Mobile phones, wired communication equipment, steel structures	Potassium chloride, polyamide-6, solid dairy products
Kazakhstan	Rubber/plastic footwear, toys and models, mobile phones	Copper ores and concentrates, crude oil, ferrochrome
Kyrgyzstan	Rubber/plastic footwear, cold-resistant chemical fiber clothing, cotton textiles	Other precious metal ores and concentrates, coal, wool
Armenia	LCD color digital TVs, car tires, compressed gas cylinders, mobile base stations	Copper ores and concentrates, women's chemical fiber down products, distilled spirits
USA	Mobile phones, portable automated data processing equipment, mechanical parts, tablets, microcomputer processing equipment, audio/video equipment	Turbofan/turboprop engines, processor/controller integrated circuits, crude oil

China-EAEU Technological Cooperation

Within the "Belt and Road Initiative," China demonstrates enthusiasm for broad and deep cooperation with EAEU countries. China's comparative advantages in artificial intelligence, the Internet, and ICT can

serve as platforms for technological innovation collaboration in EAEU member states' manufacturing sectors.

In future scientific and technological innovation, China can leverage its strengths in these areas as a foundation for cooperation, actively promoting R&D and innovation exchanges with EAEU countries. Given differing distributions of mutual direct investments, China has broad options in trade and technological innovation cooperation with EAEU countries. According to the Eurasian Development Bank's Center for Integration Studies, as of early 2017, 43.8% and 10.9% of bilateral direct investments in oil, gas, and non-ferrous metals went to EAEU countries. Other sectors included communications and IT (9.6%), chemistry (8.1%), finance (6.1%), transport (4.2%), and agriculture/food (3.7%) (EDB, 2017).

China possesses strong innovation advantages in communications, IT, finance, and transport. Cooperation in these areas can maximize respective advantages, conserve innovative resources, and translate technological collaboration into tangible results, supporting modernization and trade development.

For example, as of 2016, Chinese enterprises' direct investment in Belarus increased to $417 million, concentrated in machinery (57%), tourism (24%), and construction (19%) (Belarusian Ministry of Commerce, 2017). In these sectors, China and Belarus have complementary strengths.

Financial Cooperation and Trade Stability

Early China-Russia cooperation in finance and currency has created strong foundations. Chinese commercial banks provide yuan clearing services in Russia, beginning in 2017 with the Industrial and Commercial Bank of China. Local currency swap agreements have positively influenced bilateral trade.

Following the 2014 Crimea incident and subsequent Western sanctions, China's import of Russian crude oil rose sharply, partially alleviating sanctions pressure. In February 2022, after the Russia-Ukraine conflict escalated, new Western sanctions further affected Russia. Existing financial and e-commerce cooperation with China helped maintain stable trade flows, and online purchases of Russian rubles by Chinese residents supported ruble stability.

Leveraging China's internet finance and e-commerce strengths, many Russian goods are sold on the China-Russia online trading platform and are quickly purchased by Chinese residents. On February 24, 2022, China's General Administration of Customs officially permitted the export of Russian wheat to China, significantly increasing Russia's market share. This demonstrates that financial cooperation facilitates trade and technological collaboration.

Conclusion

The international situation caused Chinese potassium fertilizer prices to reach record highs in 2022. Belarus, rich in potassium resources, has broader prospects for cooperation with China. Based on this, other trade and technological collaborations between China and Belarus also developed. From January to July 2021, bilateral import/export volume reached $2,223.23 million, up $785.805 million year-on-year (Chinese Customs, 2021).

Despite sanctions after the Russia-Ukraine conflict in 2022, China-EAEU cooperation made breakthroughs in finance and currency, notably through internet finance and e-commerce. In the future, trade and technological cooperation will differ significantly from the past, moving from raw material dominance toward technological modernization and transformation.

Keywords psychological preparation, the Olympic Games

Abstract
The study aimed to learn about the importance of psychological preparation for athletes participating in the Olympic Games and the contribution of psychological preparation in achieving titles and winning medals. For this purpose, the researchers designed a survey consisting of 14 questions distributed to a sample of 16 coaches and after the statistical analysis using a good matching test enough, the researchers reached that the coaches have knowledge and formation that allows them to prepare psychological preparation for the athletes in games Olympic, and the use of psychological preparation techniques is one of the hidden factors that contribute to crowning titles and winning medals according to the opinion of the coaches The study recommended the need to use psychological preparation within the annual plan for training and provide the necessary capabilities for its programming and the establishment of this broad cognitive field by including the profession of sports psychological report in sports teams, especially at the level of elite teams.

1- Introduction and problematic of the study:

The psychological preparation of the athletes participating in the Olympic Games is very important to ensure the best performance and improve their performance in competitions. This preparation aims to build athlete's confidence in himself, enhance his ability to withstand pressure, improve focus, as well as develop feelings control skills.

Psychological preparation is an important field of mathematical psychology and is mainly related to the high level

sport, and the interest in psychological preparation has taken from one Olympic course to another with curricula and health scientific methods through mathematical psychology and this matter has become an integral part of the training process and is very important, says "Orlick" in his study that what is characterized by sports heroes from others to rely on self -motivation, motivation and sacrifice with a large part of life during life Training and preparing for competition, as many studies have confirmed, such as "Greenspan et Feltz 1989", which emphasized psychological effects on improving performance in official competitions

The field sports psychology is one of the most important information that entered the field of sports training, which contributes a great deal to developing and developing capabilities for the athlete, as there is a great role for mathematical psychology for the player reaching the highest mathematical mattresses by studying the sports character and knowing the best ways that make this or that athlete at his best to accept training doses as well as meeting the opponent in the best condition and thus overcoming it

He must reach the higher levels in competitive sport that requires hours of daily training in accordance with the requirements of talent and genetic readiness with a codified training program according to scientific and physiological foundations in addition to an important matter, which is psychological potentials and can also be developed through psychological training programs

In a study conducted by 235 Canadian athletes who participated in the Olympic Games, Plos Angeles and Sarajevo, that 75 athletes obtained a medal, they were able to know the psychological factors that allow winning and set one goal to reach it, which is to develop their mental capabilities during their preparation for the Olympic games

(Orlick et Partington 1988)

And if we accurately follow the competition of the Olympic Games and the physical and nervous effort that the athletes exert and the different emotions, and if we look at the training methods and prepare it psychologically and know the psychological pressure that occur Desired.

Through this we raised the following question:

General question:

Do coaches realize and focus on the psychological preparation for athletes in the Olympic Games?

Partial questions:

- Do the coaches focus in their training on the preparation of the athletes psychologically?

. Does the use of psychological preparation contribute to upgrading and achieving titles according to the opinion of the coaches?

2- General hypothesis:

Football coaches realize the value and importance of psychological preparation for athletes participating in the Olympic Games

2-1 Partial hypotheses:

- The coaches participating in the Olympic Games have knowledge and training that allows them to prepare psychologists psychologically

- The use of psychological preparation contributes to upgrading and achieving titles, according to the opinion of the coaches

3- Study objectives:

- Each scientific research has a series of goals that the researcher seeks to reach, and in our research a set of goals we must reach and prove

- Learn the importance of activating the coach's psychological role and his impact on achieving goals in the Olympic Games

- Knowing the effect of psychological preparation on the level of the athletes' performance and its contribution to achieving victory and winning medals and titles.

Psychological preparation for the sports training program for athletes participating in the Olympic Games

4-Previous and similar studies

4-1 First study:

Study the thesis of Dr. Kwash Munira entitled "The reality of psychological preparation for the national elite participating in the Olympic Games.," Daly Ibrahim, Algeria, 2015 This study aims to draw the attention of officials on the sports sector on the need to form specialists in sports psychology and sports psychological counseling with high field efficiency, and integrate them into the process of integrated training of sports clubs, especially elite. And a questionnaire was used as a way to collect information on a case study of the coaches and sports elite athletes participating in the Olympic Games London 2102, and among the most important results are several conclusions that may be the beginning of the formulation of other research topics, in order to establish this broad cognitive field, which is still suffering from a lack of attention, and ambiguity in concepts and technologies by those concerned in the Arab countries in general and Algeria in particular.

4-2 The second study:

Golden study, D and others Al Et D GOULD. Entitled "Developing some psychological features of the Olympic heroes, Journal of Applied Studies for Sports Psychology 2002 Publishing House. Ins Québec and the descriptive curriculum was used by using a psychological test battery on 10 Olympics players from America who won 32 Olympic medals during 7 Olympic courses and one of the most important results reached in psychological features (the ability to adapt and control anxiety .

5-Words in the study

5-1 Psychological preparation:

It is an inseparable complementary process from the integrated preparation of the student, which includes skilled physical preparation,

Cognitive, moral, as it is necessary to plan for it in the long and short term

5-2 Olympic Games

The Olympic Games are among the most important achievements that the Olympic movement brought and is a competition between two athletes in individual or collective meetings and not between countries, and the Olympic Games are especially especially in the International Olympic Committee, as they have all the rights that have to do with them, organizers, exploit them, broadcast and reproduce by any means (1997 P64 P6).

6-Field search procedures:

The descriptive approach, which is defined as a study, was used to try to analyze, interpret and present a reality of phenomenon, or try to analyze the content of the documents to reach conclusions or generalizations related to reality or describing the tasks and responsibilities related to the work or job (Wael Abdul Rahman, 2007)

7- Study sample: Some coaches participating in the Olympic Games

8- Study tools:

questionnaire in research:

The questionnaire is a set of written questions that promise with the intention of obtaining information or opinions of the researchers about a specific phenomenon or position.

In social sciences that require obtaining information, beliefs, perceptions or opinions of individuals (Mahmoud Obaidat, 1991)

1- The scientific conditions of the tool

The sincerity of the content (arbitrators): The sincerity of the questionnaire means making sure that it will measure what is prepared to measure it, as it means "the inclusion of the questionnaire for all the elements that must be included in the analysis on the one hand, and the clarity of its paragraphs and vocabulary on the other

To make sure of the sincerity of the study tool, we used the sincerity of the arbitrators as a tool to make sure that the questionnaire measures what was prepared for him, as we distributed the questionnaire to a group of professors from the University of Al -Jilali Bounaqam Khamis Miliana. Depending on the observations and directions made by the arbitrators, we made the amendments agreed upon by most of the arbitrators, as some of the phrases were deleted and the formulation of others was changed.

After making sure of the sincerity of the questionnaire, we went directly to the trainers who were chosen to carry out this study, as the questionnaires were distributed to 16 coaches.

9- Statistical methods used in the study:

The study group relied on statistical methods of the percentage as a statistical method that serves the topic in order to take the codified form **χ^2 test**

$$\chi^2 = \sum \frac{(O_i - E_i)^2}{E_i}$$

10- Research fields:

10-1 Timetable:

This research was conducted in the year 2023

10-2 Spatial field:

The field study was conducted on and specifically a group of coaches who supervised the athletes participating in the Olympic Games and even preceded coaches through the email service and the Google form.

11-View and discuss the results:

The hypothesis 1: The coaches of the participants in the Olympic Games have knowledge and composition that

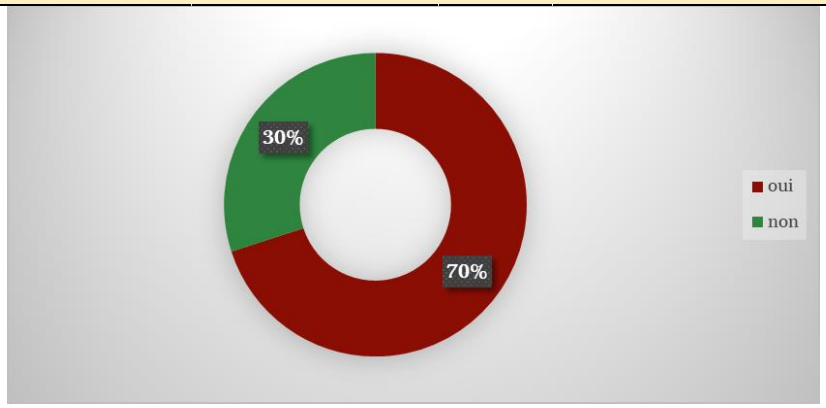
allows them to prepare the athletes psychologically

The first question: Do you think psychological preparation is one of the elements of success in the Olympic Games competition?

The aim of the question: to know how important the psychological preparation of the athletes participating in the Olympic Games.

Table No.: 01 shows the importance of psychological preparation for athletes participating in the Olympic Games

Significance	Significance level	Degree of freedom	χ^2 table	Calculated χ^2	p.c	Repetition	Answer
significant	0.05	1	3.84	4.00	70%	12	Yes
					30%	4	no
					%100	16	the total



- Form No. 01 explains the answers of the trainers about the first question

Table analysis:

Through our analysis of Table No. (01) and graphic (01) it is clear to us that the majority of coaches participating in the Olympic Games are aware of the value and importance of psychological preparation for the players, and therefore the value of the calculated as 4.00 while the value of the ka square is at the level of 0.05 and the degree of freedom was estimated at 1.84 and therefore the teams are statistically indicated

Interpretation of results: By presenting and analyzing the results of the first question, we note that the value of the calculated as 4.00 while the value of the al -Majul (3.84) is at a level of 0.05 and the degree of freedom was estimated at 1 and accordingly, the difference is statistically indicative, these results came to express that most of the coaches are aware of the value and importance of the psychological aspect and this matter is due to several reasons, including their formation and their graduation in sports training high level And their study of theoretical standards during their formation.

The second question: Is there a psychological record of the technical preparation for the athletes?

The aim of the question: to know the possibility of a physical report specialized in the technical team of the sports teams.

Table No. (02) shows the presence of the psychological report during the psychological preparation of the athletes

Significance	Significance level	Degree of freedom	χ^2 table	Calculated χ^2	p.c	Repetition	Answer
significant	0.05	1	3.84	6.25	%19	03	Yes
					%81	13	no
					%100	16	the total

Form No. 02 explains the answers of the trainers about the second question

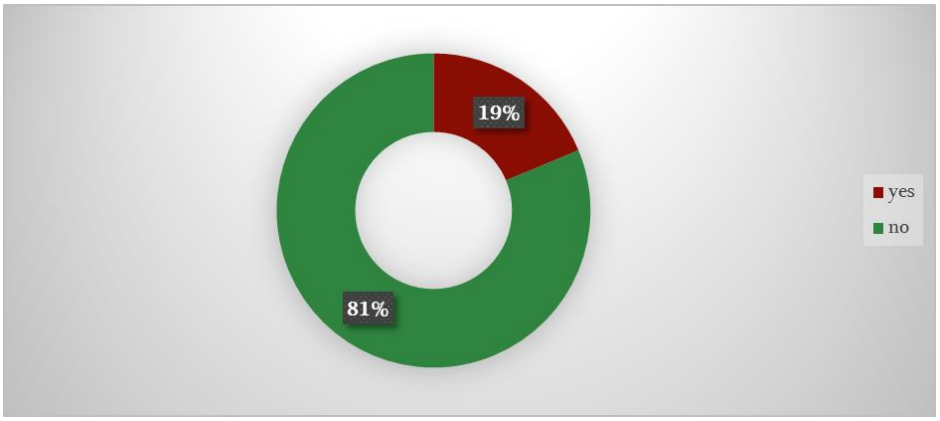


Table analysis:

Through our analysis of schedule No. (02) and graphic representation No. (02) it is clear to us that the majority of coaches deny the psychological preparation for athletes without the presence of a specialized psychological report, and this is evidence that 81 % is greater than the remaining percentage of the trainers and estimated at 19 % who do not have the participation of this field, and therefore the value of the calculated CASURI is 6.25 while the value of the CHO is at the level of 0.05 and degree Freedom was estimated at 1.84, and therefore the difference here is statistically indicated.

Interpretation of the results: By presenting and analyzing the results of the second question, we note that the calculated value of the calculated as 6.25, while the CAMULA (3,84) is at the level of significance of 0.05 and the degree of freedom was estimated at 1 and accordingly, the difference is statistically indicative, these results came to express a lack of psychological preparation, that is, the absence of a specialized psychological report and the trainer performs these tasks.

The hypothesis 02: The use of psychological preparation contributes to upgrading the level of athletes and

achieving titles according to the opinion of the coaches

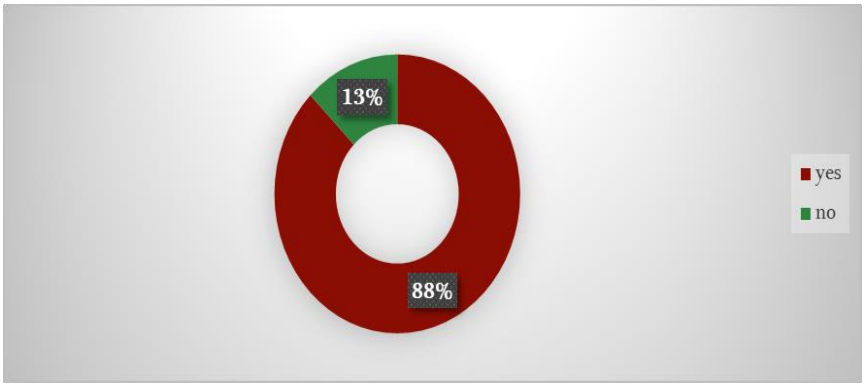
According to the opinion of the coaches

The third question: In your opinion, is the psychological numbers that you do with the players contributes to upgrading their performance?

The aim of the question: The coach's opinion on the effectiveness of psychological preparation in upgrading the level of athletes and winning medals

Table No. (03) shows the opinion of the coaches on the effectiveness of the psychological preparation in raising the level of athletes

Significance	Significance level	Degree of freedom	χ^2 table	Calculated χ^2	p.c	Repetition	Answer
significant	0.05	1	3.84	09	%87.5	14	Yes
					%12.5	2	no
					%100	16	the total



Form No. 03 explains the answers of the coaches about the third question

Table analysis:

Through our analysis of schedule No. (03) and graphic representation No. (03) it is clear to us that the majority of coaches realize the importance of psychological preparation in raising the level of performance of athletes, and this is evidence that 87.5% is greater than the remaining percentage of coaches and estimated at 12.5%, and therefore the value of the calculation of the calculated 09 while the value of the calculus as a sign of 0.05 and the degree of freedom was estimated at 1 It reached 3.84, and therefore the difference here is statistically indicated.

Interpretation of the results: By presenting and analyzing the results of the second question, we note that the value of the calculated as calculated 9 while the value of the cabinet (3,84) at the level of 0.05 and the degree of freedom was estimated at 1 and therefore the difference is statistically significant, these results came to express the extent of the coaches' conviction of the importance of psychological preparation in training and preparation of athletes in the Olympic games to improve their level and achieve more Medal and honoring their homeland

12- Conclusions and illustrations

Despite the importance of psychological preparation, it remains not up to the required level in the absence of a

specialized psychological record

- Those in charge of sports and training must ensure a qualitative training in psychological preparation strategies and to open a specialized composition of a psychological record.
- And the coaches' awareness of the importance of psychological preparation in preparing and developing players, which is a positive matter that allows the formation of players and their support in their sports competitive career
- It is necessary to form specialists in psychological psychological preparation, i.e. the proposal of the project to form the level of the level of Misance and the professional master, and this is to accompany the best for athletes by a specialist

Providing a greater number of psychologists, because today the victory and the loss is based on parties only

Acknowledgment

The authors would like to extend their sincere gratitude to the participating coaches who generously shared their insights and experiences, which were invaluable for the completion of this research. Special thanks are also due to the institutions of STAPS University of Chlef, STAPS University of Djilali Bounaama, and STAPS University of Bouira for their academic support. The authors also appreciate the constructive comments and encouragement provided by colleagues and reviewers, which helped to strengthen the quality of the study.

Conflict of Interest

The authors declare that there is no conflict of interest regarding the research, authorship, or publication of this article.

Issue web link https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html

Keywords Administrative control, property rights, building permit, urban planning law, public interest, comparative legal study.

Abstract

The relationship between property rights and administrative oversight represents one of the most sensitive intersections in contemporary legal and urban planning studies. This article investigates the dynamics of administrative control in urban contexts, with particular emphasis on the building permit system as a mechanism of balancing individual freedoms with collective interests. Property rights, sanctified in constitutional texts and reinforced by statutory law, are traditionally perceived as comprehensive and exclusive, ensuring both enjoyment and exploitation of assets by their owners. However, the exercise of such rights cannot be absolute, as they often intersect with public interest considerations, urban development policies, and environmental sustainability imperatives. Through a comparative legal study, this research explores how different jurisdictions reconcile the protection of private property with the necessity of administrative regulation, particularly in the issuance, monitoring, and enforcement of building permits. The analysis highlights the dual role of administrative oversight: on one hand, serving as a safeguard against unregulated urban expansion and environmental degradation, and on the other, acting as a limitation on individual freedoms that requires clear legal justification. By situating building permits within the broader framework of urban governance and the principle of proportionality, this study demonstrates that administrative control must strike a balance between legal certainty, equity, and efficiency in urban development. Ultimately, the findings contribute to the ongoing scholarly debate on how urban administrative law can both protect the constitutional sanctity of property and respond to the evolving challenges of modern cities, including sustainability, public safety, and social equity.

Introduction

The protection and regulation of rights and freedoms have long occupied a central place in legal systems worldwide. Numerous international conventions have been ratified, specialized institutions established, and constitutional frameworks amended in order to safeguard these fundamental principles. Yet, rights and freedoms are never exercised in an absolute manner; they are necessarily relative, conditioned by the principle that individual freedom ends where the freedom of others begins. Their exercise requires moderation, modernity, and adherence to civic responsibility to achieve the overarching objective of peaceful and orderly coexistence.

Within this framework, public administration assumes the responsibility of preserving security, public order, and social equilibrium. This is primarily achieved through administrative control, which is exercised by competent bodies at both national and local levels. Among the most significant and visible expressions of administrative control lies the regulation of urban planning and construction. These domains represent vital aspects of local governance, as they directly affect the quality of life, the provision of public services, and the enhancement of urban environments. Urban planning decisions shape the living standards of populations by providing infrastructure, housing, and facilities that determine the development trajectory of entire communities.

The state, therefore, entrusts municipalities with the crucial role of defining urban planning policies and development priorities. Such responsibilities are implemented within the framework of a broader national strategy and require cooperative governance and arbitration across institutional levels. Planning tools and urban development regulations establish general rules governing the use of land, the construction or modification of buildings, and the distribution of functions among housing, agriculture, industry, natural landscapes, and cultural heritage. These mechanisms reflect an attempt to balance the individual right to property with the collective imperative of sustainable development and public interest.

Against this background, the present study addresses two central research questions:

1. What are the legal bases and procedural rules that regulate the authority of administrative control in the field of construction?
2. What legal challenges and practical problems arise in the administration's oversight of building permits?

To answer these questions, the research employs an analytical methodology, examining legislative texts, judicial interpretations, and procedural frameworks that shape the authority of administrative oversight in the construction domain. In addition, a comparative method is applied, focusing on Algerian law and contrasting it with French and Egyptian legal systems to identify convergences, divergences, and structural shortcomings.

This study is divided into two parts. The first part explores the concept of the building permit and its supervisory dimension, while the second part examines the procedures and administrative mechanisms for granting such permits.

I. The Concept of Building Permits and Their Supervisory Dimension

1. Definition of Building Permit

From an administrative law perspective, a license generally constitutes an official decision permitting an individual to engage in an activity or perform a specified act under defined conditions. Etymologically, the notion of a "permit" is tied to the authority vested in a governing body to authorize individuals to act within the bounds of legality. While most legal systems refrain from offering a statutory definition of a building permit, leaving its contours to jurisprudence and doctrine, legal scholarship has consistently described it as a preventive measure designed to ensure compliance with planning regulations and the protection of public order.

Jurisprudence defines a building permit as a regulatory instrument that specifies the nature, purpose, and technical requirements of a proposed construction, whether residential, commercial, or service-oriented. Its

primary function is to safeguard environmental integrity and prevent harm to third parties by aligning individual construction initiatives with community interests and public welfare. Another doctrinal perspective emphasizes that the building permit is an administrative decision, issued by a legally competent authority, granting authorization to erect or modify a building. Such authorization is conditional upon strict compliance with urban planning legislation and prior to the commencement of construction works.

In the French system, the building permit (*permis de construire*) is considered both obligatory and preliminary, applying to a wide range of construction activities, including expansions and modifications (*les travaux d'agrandissement ou de construction*). The objective is to preclude unauthorized urban growth and to maintain coherence between private development initiatives and collective urban planning policies. Scholars often describe it as an indispensable administrative license that ensures construction projects conform to established regulations.

The present research advances an expanded interpretation of the building permit, emphasizing its dual nature: it is both a legal authorization for construction and a regulatory instrument aimed at harmonizing urban development with broader societal objectives. In this sense, the building permit not only enables individual enjoyment of property rights but also imposes limits designed to preserve agricultural land, archaeological sites, and environmentally sensitive areas. Thus, it functions as a legal constraint on property rights, justified by the necessity of preventing unregulated construction and safeguarding the urban and environmental fabric.

2. Building Permits as a Restriction on Private Property

Building permits represent one of the earliest forms of administrative restrictions on property rights, introduced to safeguard public order, health, and safety. By subjecting construction activity to administrative oversight, the state ensures that private building initiatives do not generate risks to public health, structural safety, or environmental balance. The issuance of a permit reflects a reconciliation between individual property rights and collective interests, whereby the state assesses the proposed building's conformity with legal and technical standards before granting authorization.

This intervention necessarily tempers the absoluteness of private ownership. Property, once regarded as an inviolable and unrestricted right, has gradually been reframed as a social function, subject to conditions aligned with the general welfare. Consequently, the exercise of property rights through construction is no longer absolute but contingent upon administrative approval. The obligation to obtain a building permit is not a derogation of ownership rights but an expression of their regulated character in a modern legal order.

Constitutions and high courts have recognized that while private property is protected, it may legitimately be subject to restrictions in pursuit of public interest. The Egyptian Supreme Constitutional Court, for instance, has upheld the principle that administrative limitations on property rights are constitutionally acceptable when they aim to preserve public order, health, and security, and when they are proportionate to the social objectives pursued. Hence, the legal framework of building permits epitomizes the evolving balance between individual autonomy and state intervention, reflecting a dynamic interplay between constitutional guarantees and regulatory necessities.

The Right to Build as an Extension of Ownership

The right to build constitutes one of the essential manifestations of the broader right of ownership. In principle, ownership entails the freedom to use, exploit, and dispose of real estate, including the undertaking of urban activities that serve private interests. Construction, as an expression of this freedom, acquires particular importance given its role in shaping both private benefit and collective urban order. Yet, this right cannot be exercised in absolute isolation. Its exercise must not contravene the public interest, urban planning regulations, or the foundations of public order. Accordingly, building activities are subjected to legal controls, mechanisms, and strict supervisory frameworks to ensure compliance with engineering, architectural, and safety standards. The right to build, though derivative of ownership, is thus conditioned by administrative regulation and prior authorization.

Comparative legal systems, including Algerian jurisprudence, have sought to reconcile two competing imperatives: on the one hand, the individual's right to exploit their land through construction, and on the other, the community's right to preserve essential easements such as sunlight, air, visibility, and access. Algerian civil law, similar to comparative jurisprudence, explicitly safeguards these easement rights, elevating them to a level of importance that must be considered before any construction begins. To this end, a building permit serves as a mechanism of prior administrative control, ensuring that the exercise of ownership aligns with collective rights.

The protection of private property has been enshrined in major constitutional and legal traditions. In France, the *Déclaration des droits de l'homme et du citoyen* of 26 August 1789 recognizes property as a "natural and imprescriptible right" (Article 2) and affirms its sacred character (Article 17), permitting expropriation only in cases of proven public necessity and with just compensation. Similarly, Article 64 of the 2019 Egyptian Constitution guarantees private property and inheritance, restricting expropriation to cases of public interest with advance compensation. The Algerian Constitution of 2020 mirrors this approach in Article 60, confirming the sanctity of property and allowing expropriation only under law and with equitable compensation. Complementing this, the Algerian Penal Code criminalizes unlawful infringements on property, as reaffirmed by the jurisprudence of the Supreme Court (Article 386).

Judicial practice further illustrates the tension between private rights and public necessity. For instance, the French *Conseil d'État* rejected an appeal to compel the Paris Municipality to issue a building permit, reasoning that public safety concerns justified the refusal. The ruling emphasized that a building permit functions as a control measure restricting private ownership in order to preserve public health and security. Where issuing a permit would constitute clear harm to the public interest, refusal becomes a lawful exercise of administrative oversight.

II. Building Permit Procedures

Building permits constitute one of the most effective tools of administrative oversight in the urban planning domain. Their purpose extends beyond mere authorization; they serve as instruments to ensure adherence to planning regulations, preserve the aesthetic and cultural identity of cities, and prevent random or uncontrolled construction. The Algerian legislator, aligning with comparative legal systems, has established a structured administrative process requiring applicants to submit a formal request containing specific data and documentation. This process is designed to balance private initiative with public oversight and is governed by strict timelines and technical requirements set forth in legislative texts.

1. Building Permit Procedures in France

In France, the legal framework for building permits is highly codified, with explicit rules regarding the content of applications, the authority competent to review them, the nature of administrative decisions, and the technical standards that must be satisfied. The *Code de l'urbanisme* provides exhaustive detail, limiting the discretion of the administration in order to guarantee transparency and fairness in the permit process.

A. Content of the Application

Article R-431-4 of Law No. 1527/2005 (dated 12 August 2005) outlines the fundamental requirements for a building permit application. These include:

1. The general information stipulated in Articles R-431-5 to R-431-12.
2. The supporting documents specified in Articles R-431-13 to R-431-31.
3. Additional requirements listed in Articles R-431-34 to R-431-34-01.
4. Procedural conditions identified in Articles R-423-19 to R-423-22.

Together, these provisions exhaustively enumerate the documents necessary for submission, thereby preventing authorities from demanding materials beyond what is prescribed in the *Code de l'urbanisme*. For example, Article R-431-5 explicitly confirms that only the listed documents may be requested, safeguarding applicants from arbitrary administrative burdens.

Key requirements include:

- **Applicant Identification:** Information confirming the legal status of the applicant (owner, tenant, or corporate entity), date of birth, and identification number (*SIRET*) in the case of legal persons. Supporting documentation must include contracts, property deeds, or land records.
- **Architectural Representation:** Article R-431-01 stipulates that applications may only be considered valid if an architect has been retained to prepare the project (*projet architectural*). The architect must sign all drawings, plans, and written submissions included in the dossier, thereby ensuring professional accountability and compliance with architectural standards.

B. Submitting the Application and the Competent Authority

Under French law, the municipality is the competent administrative body entrusted with receiving and processing applications for building permits. Applications must be submitted by the owner or their legal representative. In cases of joint ownership, any co-owner may file the application on behalf of the group. Article R-432-02 of the *Code de l'urbanisme* requires that applications be submitted in four copies; this number may be extended depending on the nature of the project. For example, five copies are required if the permit involves lands adjacent to military areas under the jurisdiction of the Ministry of Defense, or when the project is subject to the opinion of the *Architectes des Bâtiments de France (ABF)*. In environmentally sensitive zones, the number increases to six copies in accordance with Article L-331-02 of Environmental Law No. 914/2000 (18 September 2000).

Upon submission, the mayor delivers an official receipt to the applicant, specifying the registration number, date of submission, and the expected date of decision. The law also obliges municipalities to notify applicants within one month of any deficiencies in the submitted file. This obligation, stipulated in Articles R-431 and R-431-05, aims to prevent administrative abuse by prohibiting authorities from imposing additional, non-statutory requirements.

Although manual submission remains legally valid, since 2018 municipalities have progressively adopted electronic submission technologies under the *ELAN* reform. This system enables applicants to file complete electronic dossiers meeting the same legal specifications as paper submissions, thereby streamlining communication between administrations and citizens.

C. Examination and Decision on the Application

The French legislator has established strict deadlines for administrative review. Article R-423-23 of the *Code de l'urbanisme* grants the competent authority a maximum of two months to decide on residential applications and one month for applications relating to service buildings. These deadlines may be extended by an additional month in specific cases, such as when the proposed site is located on archaeologically significant land, near historical monuments, or in areas subject to environmental or agricultural preservation. Article L-123-19-02 explicitly requires consultation with specialized committees in such circumstances.

The review process concludes with either approval or rejection of the application. The decision is communicated to the applicant by registered letter with acknowledgment of receipt, ordinary registered mail, or electronically via the *ELAN* system. In the event of approval, the permit specifies both the conditions of construction and the timeframe for which the authorization remains valid. Where the decision falls within the jurisdiction of the mayor or the president of an inter-municipal cooperation body, the law further requires notification to the prefecture in accordance with Article R-423-06 of the *Code des collectivités territoriales*.

2. Procedures for Granting Building Permits in Egypt

In Egypt, the procedures for obtaining building permits are codified under Law No. 410 of 2021, which complements constitutional guarantees established in Article 64 of the 2019 Constitution. This constitutional provision safeguards private property and explicitly stipulates that expropriation may occur only for public

interest purposes and with prior fair compensation. Accordingly, the building permit system functions as both an expression of the constitutional right to ownership and as a tool of administrative control designed to reconcile private construction initiatives with broader urban planning objectives.

A. Content of the Application

Article 112 bis (a), introduced by Ministerial Resolution No. 410 of 2021, specifies the mandatory content of building permit applications. Applications must be filed at the competent *technology center* by a licensed engineer or engineering office, using standardized forms issued under the executive regulations of the Building Law and validated by the Engineers Syndicate.

The application must include, under penalty of non-acceptance, the following documents:

1. Proof of property ownership and a copy of the applicant's national ID card, or an official power of attorney authorizing the engineer to act on behalf of the owner.
2. A copy of the engineering record of the responsible engineer or office, including the calculated project cost, documented using official regulatory forms.
3. A certificate of eligibility for the works to be undertaken, signed by the responsible engineer or office.
4. A planning certificate indicating site eligibility, together with three copies of the approved engineering drawings and a spatial planning certificate.
5. Proof of payment for the engineering stamp issued by the Engineers Syndicate, along with a copy of the Syndicate-approved consultant certificate for any reports or drawings.

For projects subject to insurance under Article 46 of the Building Law, additional documentation is required:

6. A copy of construction drawings approved by the Egyptian Society for Civil Liability Insurance for Construction Risks, together with the consultant's certificate.
7. A geotechnical investigation report prepared by a consulting engineer, a structural safety report for neighboring properties, and a financial statement estimating overall project costs.

B. Filing the Application and the Competent Authority in Egypt

In Egypt, the legislator has entrusted *Technology Centers* with the responsibility of receiving building permit applications. These centers act as the administrative gateway, ensuring both formal and technical compliance. Upon submission, the application file is registered, assigned a serial number, and accompanied by an official receipt indicating the documents and data received. Within two days, the Technology Center forwards the file to the competent administrative units for further review.

Each application must be submitted in three copies, and its contents are formally inventoried through meeting minutes that confirm the integrity of the submitted documents and drawings. Once the application is verified, the Technology Center issues a preliminary certificate of eligibility for building works, stamped with the official seal. This certificate serves as a provisional authorization until the application is examined by the competent planning and organization committees. The legislator requires that the preliminary license be processed within a maximum period of one month by the relevant civilian or military planning authority.

C. Examination and Decision on the Application in Egypt

After review, the Technology Center issues a decision approving or rejecting the application. If approved, the decision is accompanied by the original drawings bearing the official stamp of the examining authority. The applicant or their authorized engineer must then pay the prescribed taxes before receiving the final permit.

Where no explicit decision is issued within thirty days, the legislator recognizes *implicit approval*. In such cases, the applicant must notify the regionally competent governor through a judicial officer of their intention to

commence construction. However, works may not begin until fifteen days after such notification, ensuring adequate time for administrative review.

Article 117 of Law No. 410 of 2021 stipulates additional safeguards: the permit is delivered only after the applicant signs the official form, and the supervising engineer or contractor must also endorse the decision. Failure to comply with these requirements results in the cancellation of the permit. This mechanism underscores the legislator's concern for procedural rigor and accountability in the construction process.

3. Procedures for Granting Building Permits in Algeria

The Algerian legislator, through Executive Decree No. 15/19 of 25 January 2015 (as amended by Decree No. 20/342 of 22 November 2020), has established a detailed framework for building permit procedures. The permit is conceived as an administrative decision authorizing the lawful exercise of ownership rights through construction. The process consists of several stages: the content of the application, the identification of the competent authority, and the examination and adjudication of the request.

A. Content of the Application

Applicants must submit:

1. A completed building permit application form prepared by the competent authority.
2. A decision authorizing the establishment or expansion of industrial or commercial establishments, where applicable.
3. A certificate of land usability, accompanied by a site plan, block plan, and architectural designs on approved scales (1:50, 1:10, or 1:20).
4. A memorandum containing a descriptive and financial inventory of the works, along with a civil engineering feasibility study.

Eligible applicants include landowners, their legally empowered agents, and tenants holding notarized and registered lease contracts. Ownership is defined broadly to encompass individuals holding registered titles, beneficiaries of state-supported housing, and holders of development certificates under Law No. 90/25 of 18 November 1990.

B. Competent Authorities

The competence to issue building permits is distributed across three levels:

- **The Mayor:** Article 48 of Decree No. 15/19 designates the president of the municipal people's council as the primary authority to grant building permits, including demolition and restoration permits. The mayor may also issue permits outside municipal plans for state-owned lands, subject to binding approval from the governor.
- **The Governor:** Under Article 49, governors are competent to issue permits for public facilities and collective housing projects exceeding 200,000 units but below 600,000 units.
- **The Minister of Urban Planning:** Article 49, paragraph 7, reserves to the Minister the authority to license projects of national interest, such as collective housing exceeding 600,000 units, as well as facilities constructed for foreign governments, international organizations, or concessionary energy institutions.

C. Examination and Adjudication of the Application

Article 48 of Decree No. 15/19 prescribes that municipal applications be processed through a *single-window* system. The mayor must transmit the file within eight days to the relevant advisory services for review. These services, represented at the municipal level, are required to provide their opinion within fifteen days.

Where applications fall under the jurisdiction of governors or ministers, the municipal council forwards seven copies of the file, along with its opinion, to the state-level urban planning services. These agencies must seek consultation from specialized bodies and render a decision within twenty days.

D. Possible Outcomes

1. **Approval:** Article 51 requires notification of approval within twenty days of submission. The permit authorizes construction strictly in accordance with approved designs and for a legally specified period.
2. **Rejection:** Article 50 requires that rejections be formally justified, allowing applicants to contest the decision before administrative courts. Competence lies with municipal administrative courts or, in ministerial cases, the Administrative Court of Appeal in Algiers, pursuant to Articles 800 et seq. of the Code of Civil and Administrative Procedure No. 09/08.
3. **Postponement:** Article 51, paragraph 2, authorizes postponement where supplementary documents are required, or where land is situated in special zones. The postponement period may not exceed one year and serves as a precautionary measure against administrative liability.
4. **Administrative Silence:** While the decree does not explicitly address administrative silence, legal commentators largely interpret prolonged inaction as an implicit rejection. This interpretation allows judicial oversight of administrative inaction, ensuring that silence does not serve as a means of arbitrary obstruction.

Conclusion

The findings of this study reaffirm the fundamental principle that administrative authorities, in exercising their duties, act primarily to safeguard the public interest. This responsibility necessarily empowers them to impose restrictions on certain individual rights and freedoms. However, such authority cannot be absolute; it must be bounded by legal checks and balances to ensure that administrative actions remain within legitimate limits. When administrative measures exceed these boundaries, they are rendered invalid and subject to annulment.

Ensuring the legality of administrative actions requires the establishment of effective oversight mechanisms. Across comparative legal systems, four principal modes of control are recognized: administrative oversight, political oversight, independent institutional oversight, and judicial oversight. Among these, administrative oversight remains the most frequently applied, as it allows administrations to regulate themselves and to rectify acts tainted by illegality through withdrawal, amendment, or annulment. This form of oversight also enhances accountability by fostering greater diligence among public officials, who are continuously aware of supervisory control exercised by their superiors.

Despite these safeguards, the study identifies a critical challenge in the context of building permits: the issue of *administrative silence*. Leaving such silence open to judicial interpretation risks undermining individual rights, particularly property rights that hold a constitutionally enshrined status in Algeria, France, and Egypt. Judicial practice, while pragmatic and fact-based, often lacks the flexibility of legislative clarity and may inadvertently restrict freedoms through restrictive interpretations. Consequently, the absence of explicit legislative regulation on the consequences of administrative silence in building permit procedures represents a significant shortcoming.

Therefore, this research recommends that legislators adopt reforms to urban planning legislation that explicitly address administrative silence, thereby closing gaps that could compromise the balance between public interest and private rights. Such amendments would not only reinforce legal certainty but also protect the constitutional sanctity of property, ensuring that administrative powers are exercised within a clear and equitable legal framework.

Acknowledgement

The author extends sincere appreciation to the Mediterranean Laboratory for Legal Studies at the University Centre of Maghnia for its institutional support and provision of academic resources essential to the completion of

this study. The author also wishes to thank colleagues specializing in administrative and urban law for their valuable feedback and comparative insights, which significantly enriched the analysis.

Conflict of Interest Statement

The author declares that there are no conflicts of interest associated with this research. The study was conducted independently, without financial, institutional, or personal influences that could have affected its objectivity, integrity, or conclusions.

Keywords International competitiveness, United States, global governance, multinational corporations, protectionism, economic sanctions, international economic relations.

Abstract

This article provides a comprehensive examination of the theoretical foundations and practical applications of the American school of thought on the international competitiveness of nations. The study traces the evolution of U.S. approaches to maintaining global leadership, beginning with classical concepts of free market dominance and progressing toward modern strategies that combine innovation, technological superiority, and geopolitical influence. Particular attention is given to the interaction between government policies, multinational corporations, and academic frameworks that together form the intellectual core of the American school. The analysis highlights how mechanisms of protectionism, economic sanctions, and global governance are strategically applied to safeguard U.S. national interests while simultaneously projecting power across international economic relations. Moreover, the research underscores the adaptability of the American school in responding to shifting global challenges, from post-war reconstruction to the digital economy and the current multipolar system. Based on this comparative analysis, conclusions are drawn regarding the implications for other economies, with an emphasis on lessons applicable to Russia's pursuit of sustainable competitiveness in the contemporary world order. The article formulates practical proposals for enhancing the performance of Russian economic entities through the adoption of innovative strategies, institutional modernization, and integration into new models of international cooperation.

Actuality. The relevance of this study is determined by the growing importance of national competitiveness as a key factor in global economic security and political influence. In the 21st century, the ability of states to compete internationally depends not only on natural resources or industrial capacity but increasingly on innovation systems, financial institutions, and global economic strategies. The American school of international competitiveness represents one of the most influential intellectual traditions shaping economic policy worldwide. Its doctrines and practices have played a decisive role in the construction of the U.S. leadership model, the establishment of global governance mechanisms, and the regulation of transnational economic flows. In the current context of geopolitical confrontation, rising protectionism, and the fragmentation of international markets, an in-depth understanding of the evolution of this school is of particular value. For Russia and other emerging economies, the analysis offers both theoretical insights and practical recommendations for building resilient economic systems capable of competing effectively within the multipolar world order. Thus, the article contributes to the global debate on competitiveness by clarifying the strategic tools employed by the United States and by formulating proposals for alternative development paths in international economic relations.

Introduction

Research aimed at improving theoretical concepts of forming international competitiveness of actors in international economic relations (IER) is currently a relevant and promising scientific direction. It has been most thoroughly developed by representatives of the American school, who serve as advocates of a unipolar world order. However, only a limited number of scholarly works reveal their evolution under conditions of transition toward a polycentric global system.

This article analyzes the multidimensionality of international competitiveness in the American school using a systems approach, which discloses interaction and interconnection at macro-, meso-, and micro-level subsystems of international economic relations (IER) within today's geopolitical and geo-economic realities (Abramov & Prokofyev, 2021; Ryazanov, 2021).

Porter's Concept and the "Competitive Diamond"

One of the most internationally recognized theoretical frameworks is the concept of national economic competitiveness (NEC) developed by Michael Porter, a prominent representative of the American school. This concept, based on research at Harvard University, synthesizes earlier theoretical approaches, beginning with Adam Smith, the founder of economic theory (Tong-song, 2013).

Porter's conceptual contribution was the formulation of the "competitive diamond," which integrates four interrelated determinants of competitive advantage:

1. **Factor conditions**,
2. **Demand conditions (domestic and external)**,
3. **Related and supporting industries**, and
4. **Firm strategy, structure, and rivalry**, which increasingly rely on flexible network structures under globalization (Porter, 1993).

According to this framework, high national competitiveness is achieved by progressing through four stages of economic development: factor-driven, investment-driven, innovation-driven, and wealth-driven. Countries dependent solely on resource exports may experience "Dutch disease," losing competitiveness in global markets. Porter's central conclusion is that *firms, not nations, compete in international markets*, and therefore the role of a country is to provide conditions for firms to sustain competitive advantage (Porter, 1993).

The Role of Multinational Corporations (MNCs) and Clusters

Porter later extended his concept to the activities of multinational corporations (MNCs) as key actors in IER. He emphasized the role of clusters in achieving U.S. competitiveness, conducting econometric analyses of regional development in American states, and justifying their growing contribution to export potential (Porter, 2003).

The original American model, rooted in liberal and monetarist approaches, limited the role of the state to indirect regulation. Government involvement in competitiveness was considered inefficient, leaving the main responsibility to market forces and MNCs.

Reconsideration of Government's Role

Today, as the U.S. loses its hegemonic status in a unipolar world, the Porterian view of minimal state intervention has been radically revised. Harvard Business School's report *U.S. Competitiveness: A Matter of National Security* stresses that competitiveness must be assessed beyond the simplified "competitive diamond" (Disparte, 2013).

Weak government capacity to create jobs, inadequate workforce training in STEM fields, and excessive shareholder-driven behavior of MNCs—often involving tax avoidance and offshoring—are now considered key threats to U.S. competitiveness.

New Concepts: National Competitiveness in the 21st Century

A more comprehensive approach was presented in *The Determinants of National Competitiveness* (Delgado et al., 2012). This framework emphasizes the U.S. advantage from the dollar's role as a global reserve currency, enabling influence over global investment attractiveness while supporting American MNCs' expansion.

In practice, this has been reflected in U.S. neo-protectionist policies—trade wars, sanctions, and geopolitical pressure—aimed at maintaining global leadership. International organizations (IMF, World Bank, OECD) serve as platforms for promoting and legitimizing these models through global competitiveness indices.

Soft Power and the Institutionalization of Competitiveness

The American school also uses *soft power* to entrench its ideology globally:

- Educational programs and standards,
- Scholarships for foreign students,
- Training managerial elites for global corporations.

Harvard Business School remains central, conducting annual monitoring and publishing competitiveness reports. Despite a decade of growth, these reports highlight persistent structural failures in the U.S. political system that hinder significant progress (Porter et al., 2019).

Implications for Russia

American competitiveness concepts reinforce unipolarity, reducing states' roles in favor of MNCs. Developing countries are pressured into resource dependency and technological import reliance, which benefits global corporations. For Russia, which faces unprecedented sanctions and hybrid trade wars, these frameworks expose the dangers of liberal economic policies. A radical revision of economic and structural strategies is required, prioritizing:

- **Diversification and reindustrialization**,
- **Technological independence**,
- **State-led protectionism**,
- **Support for domestic corporations and innovation ecosystems**.

Conclusion

The American school of international competitiveness is grounded in globalization under U.S. dominance, legitimizing the power of MNCs as primary drivers of competitiveness. Through global institutions and soft power, it imposes models that diminish national sovereignty.

For Russia, adapting these theories requires rejecting excessive liberalization, strengthening state regulation, and reindustrializing on the basis of advanced technological paradigms to secure economic sovereignty.

Acknowledgement

The author expresses sincere gratitude to the colleagues at the Institute of International Economic Relations Research and the Department of World Economy and International Business at the Financial University under the Government of the Russian Federation for their intellectual support and constructive discussions. Their insights and critical feedback significantly enriched the analysis presented in this article.

Conflict of Interest

The author declares that there is no conflict of interest regarding the publication of this article. All conclusions and recommendations were developed independently and reflect solely the scholarly perspective of the author.

Keywords Secession of South Sudan, Arab National Security, Egyptian Water Security.

Abstract
The secession of South Sudan from the North in 2011 represented a historical turning point whose repercussions were not limited to Sudan's internal affairs but extended to cast their shadows on Arab national security in general, and on Egypt in particular. Sudan has long been, due to its strategic geographical location and its historical and cultural ties with the Arab sphere, a strategic depth for Egypt and a gateway to the Horn of Africa.
Therefore, the fragmentation of Sudan did not only create a political vacuum but also raised a set of security, economic, and political challenges that require in-depth analysis to understand their dimensions and their impact on the vital interests of Arab states. This article aims to review and analyze the implications of South Sudan's secession on Arab national security, focusing on Egypt as a case study, by examining the direct and indirect repercussions on its water security, borders, and regional stability.

Introduction

Despite Southerners obtaining the right to self-determination through the referendum held in January 2011, this did not put an end to Sudan's problems. On the contrary, the manifestations of secession began to reflect negatively not only on Sudan but also on its Arab and African neighbors, who share intertwined borders as well as ethnic and tribal overlaps with it. Furthermore, some movements and ethnic groups in neighboring states, inspired by South Sudan, have also demanded secession, which may create a state of political instability that will, in turn, affect Sudan's relations with its Arab and African surroundings.

The secession of South Sudan created a new situation with economic, political, and security dimensions. This secession has had repercussions, consequences, and risks at various levels, the most important being its implications for Arab national security in general and Egyptian national security in particular. This is what the present article aims to address.

Significance of the Study

The importance of this study lies in highlighting the features of the threats facing Arab national security in general and Egyptian national security in particular as a result of South Sudan's secession. It also emphasizes the necessity of functional integration among the units of the Arab regional system, since Egyptian national security does not conflict with Arab national security but rather complements it.

Research Problem

The research problem revolves around the following main question:
What are the implications of South Sudan's secession for Arab national security in general, and for Egyptian national security in particular?

Research Questions

From this main issue emerge several sub-questions, including:

- What is Arab national security?
- What are the threats to Egyptian national security following the secession of South Sudan?
- Could Egypt's share of Nile waters be affected by the secession of South Sudan?

Hypotheses

In order to answer these questions, the following hypotheses are proposed:

- The secession of South Sudan represents a new phase in the threats facing Arab national security.
- There is a complementary and interdependent relationship between Egyptian national security and Arab national security.
- The creation of the state of South Sudan has added a new actor to the Nile Basin system, threatening the water interests of both Sudan and Egypt.

Methodology of the Study

The methodologies and tools used in analyzing this topic are as follows:

- **Historical Method:** This was used to study, analyze, and trace the repercussions of South Sudan's secession on Arab national security, with particular focus on Egyptian national security.

Descriptive Method: This method relies on description, which is the essential feature of most scientific research, through describing the phenomenon or subject under study and identifying its characteristics [1]and we relied on this method because it provides us with a general descriptive picture of the repercussions of secession on Arab national security and Egyptian national security.

Case Study Method:

The case study method is considered one of the most important approaches in the humanities and social sciences, as it focuses on a specific phenomenon while relying on both material and moral foundations. Its purpose is to comprehensively address the subject under study and to uncover its underlying dimensions. This method examines the details in relation to the whole that encompasses them, based on the idea that particulars are merely one aspect

or manifestation of the overall reality[2]. **We will address** the repercussions of South Sudan's secession on Arab national security in general, with a particular focus on Egyptian national security as a model or case study.

Structure of the Study
This article has been divided, in line with the study requirements, into several key sections:

- **Section One:** Security and National Security (Concept and Characteristics).
  - Arab National Security (definition, dimensions, levels).
- **Section Two:** The repercussions of South Sudan's secession on Egyptian national security.
- **Section Three:** Egyptian water security.

Thus, we have structured our article into these main axes. In Section One, we address the nature of national security by presenting different definitions of the concept. Section Two, titled *The Repercussions of South Sudan's Secession on Egyptian National Security*, discusses the direct threats posed to Egypt's national security. This focus on Egypt is not incidental but is based on several considerations, foremost among them its geographical proximity and the interconnectedness of Egyptian national security with Sudanese national security on the African level. Given the wide-ranging and multifaceted nature of Egyptian national security, we will concentrate particularly on the issue of Egyptian water security.

Section One: Security and National Security (Concept and Characteristics)

To begin, it is essential to define *security*, *national security*, and *Arab national security*.

First:
The concept of security is among the most complex concepts addressed in scientific analysis, due to its relative, changing, and multidimensional nature, involving various levels. It faces both direct and indirect challenges from different sources, varying in degree, type, scope, and timing whether related to the security of the individual, the state, the regional system, or the international order. It is one of the central concepts in the field of international relations, which has been marked by great ambiguity since its emergence as an independent academic discipline after World War II.

The study of national security cannot be fully understood or interpreted without first clarifying the general concept of security and then analyzing the notion of national security.

The meanings of *security*, both linguistically and terminologically, converge on the idea that security entails achieving calm, reassurance, and stability at the level of the individual, the community, and the nation. It stands in opposition to fear, and is essentially equivalent to the absence of threat or danger[3].

Henry Kissinger defines security as: *"Any action through which society seeks to achieve its right to survival."* He also describes it as *"the ability to free oneself from a major threat to the higher individual and collective values, through all possible means to preserve at least the right to survival,"* or as *"the absence of threat to fundamental values[4]."*

Second:
The concept of national security is relatively modern in political science, and for this reason, it remains one of the most ambiguous concepts. It has not yet crystallized into a fully developed field of political science governed by the rules of epistemology—starting from formulating hypotheses, defining appropriate research methods, selecting scientific verification tools, establishing rules of proof and refutation, and eventually reaching a general theory and a law that governs the phenomenon of national security.

The term *national security* emerged as a result of the rise of the nation-state in the 16th century AD. It is defined as the state's ability to protect its territory and its fundamental and essential values from external threats, especially

military ones. Ensuring the protection of the state's territory against foreign aggression, and safeguarding its citizens from attempts to harm them, their property, beliefs, and values, constitute its core. With the evolution of the concept of state capacity, the notion of national security expanded to encompass the state's comprehensive ability to protect its values and interests from both external and internal threats.

National security has political, economic, social, military, ideological, and geographical dimensions, each with its own characteristics that demonstrate their interconnection and complementarity.

A significant number of Arab scholars and thinkers have addressed the concept of *Arab national security*. Among these, Amin Houidi defined national security as: *"A set of comprehensive measures taken by the state, within the limits of its capacity, to preserve its entity and its interests in the present and the future, while taking into account international variables.*[5]*"*

Hamed Rabie emphasizes that the concept of national security, in its essence, is a **military concept** rooted in the defensive characteristics of the national territory. However, in its theoretical formulation, it evolves to establish rules for collective and leadership behavior with a **political dimension** that is not limited to internal dealings [6].

National security is a comprehensive concept whose threats are not confined to the presence of an external military danger, nor is its protection limited merely to increasing the state's military capabilities, as was commonly assumed in the traditional view of the concept.

Third:
Arab National Security is the ability of the Arab nation, collectively, to defend itself and its rights, to safeguard its independence and sovereignty over its territories against any external aggression, and to confront challenges and risks by developing Arab capacities and resources in all fields within the framework of comprehensive Arab unity. This ensures a secure future for its people and enables them to contribute to the building of human civilization[7].

Among the clearest definitions of **Arab national security** is that proposed by the General Secretariat of the Arab League in its study on Arab security. It defined it as: *"The ability of the Arab nation to defend its security and rights, safeguard its independence and sovereignty over its territories, and develop Arab capacities and resources in all political, economic, and social fields, relying on military and diplomatic power, while taking into consideration the national security needs of each state, which in turn affect Arab national security.*[8]*"*

In brief, national security can be defined as the safeguarding of the state's borders, interests, values, and culture from looming threats. These threats may be external—emanating from neighboring states or major powers or internal, such as threats to the state's legitimate system or the safety of citizens caused by the loss of one of the core elements of security: military strength, economic development, and political stability.

There are numerous internal and external dangers and challenges threatening Arab national security, linked to the resources, wealth, and natural characteristics of the Arab world. These factors have made the Arab region of immense economic, political, strategic, and civilizational importance.

The security characteristics of the Arab homeland have made it a focal point of global attention, especially from major powers, due to its abundant material and human resources, as well as its unique geographical position that grants it a significant geostrategic role in the global order. Furthermore, cultural, social, and religious bonds tie the peoples of the Arab world together, rendering it an indivisible unit. Although it is based on the concept of the nation-state, these bonds unify its peoples like a single body: if one part suffers, the rest responds in solidarity.

From the perspective of national security, South Sudan is of great importance because of its direct connection to Arab security in general, and its tangible impact on the vital interests of some influential Arab states in the region directly on Sudan, and indirectly on Egypt.

Thus, the repercussions and consequences of South Sudan's secession will be profound and immediate, affecting both the near and distant neighbors. In fact, the secession of South Sudan can be likened to a fragmentation bomb whose shrapnel will inevitably strike all nearby states.

Section Two: The Repercussions of South Sudan's Secession on Egyptian National Security

First: The Importance of Sudan in the Equation of Egyptian National Security

Sudan is considered Egypt's backyard and its southern front, which Egypt constantly seeks to keep secure. Dr.

Kamal Amer stated that national security is linked to the comprehensive power of the state, which is built on several important elements, including the **geopolitical factor**, represented in the shape of the state and its geographical location. From this perspective arises the vital importance of Sudan, which shares with Egypt a border of approximately **1,273 km** [9].

Sudan lies within the sphere of Egypt's **direct national security**, given the shared borders, geographical proximity, and unity of destiny between the two countries. The Egyptian-Sudanese border extends approximately **1,273 km**, with Sudan representing Egypt's southern strategic depth. Therefore, Sudan's security and stability are integral parts of Egypt's national security.

The importance of Sudan to Egypt also stems from the intertwining of the two countries' relations across multiple shared issues that require constant coordination. In addition to the multidimensional bilateral relations, there are numerous regional files and issues for which the coordination of both countries' positions is vital to the national security of both states, their peoples, the Arab nation, the African continent, and the entire region. Chief among these is, of course, the issue of **Nile waters and the Grand Ethiopian Renaissance Dam (GERD) crisis**.

On January 1, 2020, Sudan's transitional Prime Minister, Dr. Abdalla Hamdok, declared that Sudan occupies a key position in the GERD issue and would not allow any harm to befall Egypt. He stressed Sudan's awareness of the importance of the Nile River, thereby underlining that Sudan's stance on the dam carries great significance for **Egypt's water security**[10].

There are also other areas of cooperation between Egypt and Sudan, such as the issues of **security and stability in the Red Sea Basin and the Horn of Africa**, as well as coordination on African affairs whether through the African Union and other continental and regional organizations, or in dealing with influential issues such as **combating terrorism and extremism**, among others.

The importance of Sudan in the equation of Egyptian national security is further reinforced by what Sudanese journalist Rajab stated in an exclusive interview with *Sputnik* on January 18, 2018: that all attempts to sow discord between Egypt and Sudan will fail, because the historical roots binding the two countries are deeply entrenched. Regardless of differences, the two ultimately form one entity, each serving as the other's strategic depth, with Egypt considered a gateway of national security for Sudan[11].

Second: The Pillars of Egyptian National Security

These can be summarized as follows:

- **Focus on Sinai:** The defense of Egypt's northeastern borders must be anchored in the Levant, where the first line of defense is located in the far north, the second line in Palestine, and the third line at the Suez Canal. This is why Pharaonic Egypt conducted annual campaigns in the Levant aimed at eliminating any hostile power that could threaten Egyptian national security.
- **Egypt's security begins with Palestine:** The Zionist threat to Egypt originates from there, and therefore confronting it must also begin from that point.
- **The Nile as the lifeline of Egypt:** The centrality of the Nile to Egyptian life necessitates a specific type of cooperative relations with the states where its sources lie in Ethiopia or Central Africa. It is essential to prevent any power from controlling the Nile's sources or from establishing a presence in Sudan that could threaten Egypt's southern belt.
- **The necessity of strategic alliances:** Egypt must ally with one great power against another when needed, without compromising Egyptian sovereignty or domestic affairs. No leadership can afford to ignore the concept of balance of power among the great powers [12].

Egypt's security begins with its Arab identity: Arabism is not a burden on Egypt but rather a security shield for its interests. Egypt can never afford the luxury of isolation or withdrawal into itself, because detaching Egypt from its natural Arab sphere is a sure warning sign of its vulnerability to internal destabilization[13].

Egyptian national security has never, at any point in its history, been in conflict with the concept of Arab national security. On the contrary, overlap, interaction, and cooperation have been the defining features of the relationship between the two.

Security Circles of Egyptian National Security

Egypt's security circles can be identified in three main directions:

1. **The Northern Direction:** Referring to the dangers posed by the Zionist presence in Palestine, and the role of Sinai in Egyptian national security.
2. **The Southern Direction:** Relating to the sources of the Nile River.
3. **The Western Direction.**

In this study, our main focus is on the **southern dimension and the Nile sources**, while also acknowledging the importance of the other directions for a comprehensive understanding of Egyptian national security.

The secession of South Sudan will have **direct negative repercussions on Egypt**. Egypt views this secession as a factor that will lead to the fragmentation of Sudan, a development that will negatively affect Egyptian national security especially concerning Nile water issues, migration, the reduction of trade and employment opportunities, and the spread of small arms and organized crime[14].

The realities of geography, the facts of history, and human ties have imposed a special relationship between Sudan and Egypt, one that perhaps no other two peoples in the region have experienced. There has long been a strong bond between the two brotherly nations, and the Nile will forever remain the eternal link between the Sudanese and Egyptian peoples. Indeed, many families in Aswan trace their roots back to Sudan, reflecting ties of kinship, marriage, and blood.

Sudan represents Egypt's southern strategic depth; thus, Sudan's security and stability are integral parts of Egyptian national security. Egypt's security, in its African depth, is tied to Sudan's security and stability. From this perspective, Egypt's policy toward Sudan gains importance, aiming to preserve Sudan's unity, stability, and cohesion, while also enhancing relations of integration between the two sides.

Egypt's security is organically linked to Sudan's security. If Sudan is stable, Egypt is stable as well. This connection also extends to Egypt's **water security**, which is a cornerstone of its **food security**, and consequently a guarantee of its political independence. Egypt cannot achieve autonomy in political decision-making without attaining self-sufficiency in food, which is in turn linked to water resources. Moreover, Sudan is a country of great importance within the constellation of states forming the **Horn of Africa**, serving as one of the guarantees of security in the Red Sea, the Bab al-Mandeb Strait, and the Gulf of Aden[15].

From a geopolitical and economic perspective, Sudan represents Egypt's southern strategic depth. Current crises and conflicts plaguing Sudan, which increasingly threaten its very existence, have direct repercussions on Egyptian national security. Egypt is, in fact, one of the first countries to be directly affected by developments on its southern borders. The secession of South Sudan carries numerous implications for Egypt, including:

- **Dependence on the Nile:** Egypt relies heavily on the Nile River to sustain its economy, as the Nile constitutes the lifeline of Egypt. With the birth of the state of South Sudan, Egypt will inevitably be affected by the situation in the Nile Basin. This event represents a genuine threat to Egypt's water security, since the newly established South Sudan is likely to exploit and utilize Nile waters to drive its development—supported by the United States and Israel. These two powers may in the future use water as a means of pressure and blackmail against Egypt.
- **Economic burdens from Northern Sudan:** The secession will also impose economic challenges on Egypt, as oil from the disputed Abyei region has become part of South Sudan's share. Moreover, international actors

backing the South are keen on ensuring that Abyei does not fully belong to it, a situation that carries negative consequences for the Egyptian economy[16].

- **Loss of the African market:** The secession of South Sudan provides a favorable platform for American interests to counter Chinese economic expansion in Africa. As a result, African markets will be flooded with Chinese goods arriving from Asia, alongside American–Israeli products manufactured in South Sudan[17].

In reality, Egypt is the biggest loser from the secession process after Sudan, due to the grave implications for both Egyptian and Arab national security. The fragmentation of Sudan into weak mini-states opens the door to foreign intervention and threatens Egypt's security and stability. This is particularly concerning as South Sudan is expected to adopt a non-Arab orientation, one that is likely to be characterized by hostility toward Egypt and opposition to its interests especially regarding its vital water interests in the Nile River. This stems from the longstanding ties between South Sudanese leaders and Israel, ties that are expected to deepen further following South Sudan's independence[18].

Water is an integral part of national security, as it has become one of the fundamental factors for economic growth and a constant concern for all countries of the world. This concern has come to be known as *water security*, which has developed into a security issue with multiple dimensions: economic, geographical, political, and legal.

The economic dimension is evident in the role of water in agriculture, energy, transportation, and industry. Water is, therefore, an existential necessity its absence inevitably means the absence of economic development. Yet economic development itself is one of life's essential requirements, as stated by Allah the Almighty: ("And We made from water every living thing")[19].

Strategists agree that the lack of sufficient water and food in any country constitutes a threat to its national security. If water equals life, then the Nile River is the life of Egypt and the secret of its existence. Hence came Herodotus's famous phrase: *"Egypt is the gift of the Nile."* Undoubtedly, without that river, Egyptian civilization would not have arisen since the dawn of history, nor would it have flourished or advanced.

Axis Three: The Impact on Egyptian National Security through Its Water Lifeline, the Nile River

Water security is considered one of the most important pillars of the national security of any state. The importance of water security emerges as one of the strategic issues directly related to national and collective security, particularly since it touches upon the very existence, life, identity, and sovereignty of peoples. Because water is among the most essential cross-border resources, countries compete to secure sufficient quantities to sustain their development plans. Therefore, nations enact water legislations, treating it as a national asset. In light of continuous population growth, and the consequent need for forward planning in population, agriculture, and other policies closely linked to the water sector, the issue becomes even more critical.

Water Security: The importance of water security lies in the fact that it is one of the fundamental components of the national security of any nation. In today's world, water has become one of the elements of international conflict. The growing imbalance between states that possess water resources and those that are in need of them has led to intensified disputes, giving rise to expressions such as *"blackmail through water"* and *"the use of water as a weapon."*[20]

Water security means preserving the available resources, using them in the best possible way, preventing their pollution, and rationalizing their use in drinking, irrigation, and industry. It also entails striving by all means to search for new water sources, developing them, and enhancing their investment capacities. Water security is no less important than any other form of security; on the contrary, its importance surpasses all others, given that it is possible to produce more food through various agricultural and industrial methods, whereas the possibilities for increasing sources of fresh water remain limited[21].

Military security cannot be achieved by any state without economic security, and economic security cannot be realized without food security, the backbone of which is water. With the broadening of the concept of national security which is no longer confined to military aspects alone but has extended to include food and water security the concept of water national security has emerged as one of the most important dimensions of national security, given its vital role in development and state stability. Consequently, many studies have defined the concept of water security as "the individual's water needs throughout the year," which came to be known as the *water stress index*, i.e., the annual per capita share of renewable fresh water resources used for productive purposes such as agriculture and industry, as well as for domestic consumption.

Water security thus means preserving the available water resources, using them in the best possible manner, preventing their pollution, rationalizing their use in irrigation, industry, and drinking, and striving by all means to search for new water sources, develop them, and enhance their utilization[22].

The interests of Egyptian national security are closely tied to safeguarding and protecting water national security, embodied in the Nile River. These interests can be summarized as follows:

- **Survival**: The Nile represents a primary and fundamental source of Egypt's existence and continuity.
- **Development**: It is the most important source of Egypt's economic development.
- **Stability**: The Nile is the foundation of stability in Egypt.

Sources of Threats to Egyptian Water Security:

The threats to Egyptian water security can be divided as follows:

- **Threats from within the Nile Basin region:**

1. **Ethiopia and the construction of the Grand Ethiopian Renaissance Dam (GERD):** It is worth noting that 33.0% of Ethiopia's territory lies within the geographic boundaries of the Nile Basin, and 11.7% of the Nile Basin's total area is located within Ethiopian land[23].

2- The State of South Sudan:

Since its secession, South Sudan has maintained close relations with the upstream countries, which consistently support it in its disputes with Sudan. Consequently, its position aligns with the upstream states against Egypt and Sudan regarding the Grand Ethiopian Renaissance Dam (GERD), and it supports the Nile Basin countries' framework agreement.

This stance is governed by several influencing factors, most notably:

- The lack of need for water in South Sudan, as nearly **5,000 billion m³** of rainfall occurs within its territory.
- Its need for upstream states' backing and regional support in its disputes with Sudan.
- Its hostility toward Sudan and the contentious issues between them.
- Its strong ties with Israel, which seeks to weaken Egypt's position in the Nile Basin in order to achieve its ambitions of controlling the Nile waters.

The countries of **Kenya, Tanzania, Uganda, Rwanda, and Burundi** refuse to recognize Egypt's historical rights to the Nile waters. They argue that the agreements on which Egypt bases its claims were signed during the colonial era, and they do not acknowledge them. These states seek to **redistribute the Nile waters** and to diminish Egypt's regional standing.

Threats to Egypt's water security from outside the Nile Basin region:

- The role of the United States in supporting Israel, which aims to weaken Egypt's power, using the water issue as a bargaining chip within the framework of other files, foremost among them the reorganization of the Middle East.

The competition between **China and India** with Europe in Africa in the fields of agricultural investment and the implementation of water and agricultural projects, which in turn **increases Ethiopia's demand for water**[25].

Israel follows a policy of **continuous incitement** of Egypt's strategic neighbors to participate in river basins, stirring feelings of injustice caused by what it describes as the unfair distribution of water. This has become evident in the Nile Basin, where Israel uses either its direct assistance or American aid to secure its influence over African countries located in the Nile Basin, such as **Kenya and Rwanda**.

With the escalation of Egypt's crisis with the Nile Basin countries and the disputes over the share of Nile water allocated to Egypt and Sudan, the hidden Israeli role became apparent in inciting the African upstream states to violate the international agreement governing the Nile Basin countries. The water crisis between the upstream African states and the downstream Arab states revealed the **true Israeli ambitions in the waters of the Nile River**.

Given the importance of water in sustaining Israel's presence in the Arab world, and its early realization of this fact, Israel's ambitions in Arab waters—particularly the Nile—date back several centuries. Since then, Israel has shown increasing interest in the Nile Basin countries, believing that the river could serve as a permanent water source for Israel, while at the same time constituting a **threat to Egypt's national security**[26].

Israel seeks to **encircle the Arab Republic of Egypt** by tightening its control over Egypt's southern flank, thereby depriving it of its strategic depth. Through its presence in the **Horn of Africa** and specifically in **South Sudan**, Israel aims to influence Egyptian national security and exert pressure on Egypt through its lifeline, the **Nile River**, which represents one of the most vital natural resources for the Egyptian economy, due to several considerations:

- The Nile River has contributed to the stability of Egyptian life in the Delta and the Valley, where cities and villages have arisen along its banks.
- Egyptians rely on it as a source of **fresh water** for various purposes, including drinking.
- The Nile is an important source of **electricity generation**, as the High Dam is used to produce hydroelectric power.
- Egypt's **industries** depend heavily on the waters of the Nile, and it is also used for inland water transport.
    - Through the Nile, canals have been dug to reclaim parts of the desert and establish new cities.
    - The Nile also hosts **tourist ships** with hotels and restaurants that attract visitors.
    - It is considered one of the key sources for providing **fish wealth**[27].

The major challenge for Egypt lies in its attempt to preserve its share of the Nile waters. In addition to this, the upstream states have repeatedly sought to **reformulate the previous water agreements**. Following the establishment of the State of South Sudan, a new challenge arose for Arab national security: compensating for the quantities of water lost due to the reduction of Sudan's territory. This coincided with the demands of Nile Basin countries to reconsider the **1959 Agreement**, which is a revised version of the **1929 Agreement** signed between Egypt and Sudan during the British colonial era that dominated both countries. It is evident that none of the Nile Basin states were parties to those agreements[28].

The birth of a new state through which the Nile flows represents a real threat to water security, particularly since this state may use the Nile waters for its future industries, which are internationally supported by the United States and Israel. This can be used as a weapon against Egypt and Sudan, leading to the loss of influence over Egypt's position in Africa within international forums, as well as the African market. The establishment of this state also poses a danger to the existing water projects, dams, and canals along the Nile River.

Therefore, it is necessary to avoid perceiving the establishment of South Sudan merely as a solution to the problems and conflicts that plagued Sudan before independence, which might enable the North to rebuild itself after shedding the burden of the South. Such a static perspective contradicts the dynamic reality, especially since the expected conflict boundaries will not remain confined to Sudan's geographic and political borders but will expand in accordance with local, national, regional, and international variables and stimuli[29].

The future of water in Sudan and Egypt, as well as the challenges of potable water and other uses worldwide, in the Middle East, and in the Arab region, will inevitably be affected by the establishment of South Sudan once it resolves its political problems and turns toward development and cooperation with the other Nile Basin states, which are in many respects closer to it than Egypt and Sudan. This will undoubtedly affect the volume of the White Nile's waters, and the waters of the Blue Nile as well, particularly if Ethiopia continues implementing its water projects through the construction of the Millennium Dam or the Grand Ethiopian Renaissance Dam[30].

Realizing that the United States is striving to redraw the geopolitical map of Sudan and to recreate and reshape a new Sudan, the secession of South Sudan thus carries extremely grave consequences for Egypt's and Sudan's water security, and even for the national security of both states, if the developments in the Nile Basin are not handled with awareness. I believe that Egyptian policy after the revolution began to be managed according to a clear strategy that maximizes Egyptian interests, seeks to expand frameworks of cooperation, and avoids conflicts with Nile Basin countries—especially those with a direct impact on Egypt's water security.

Therefore, Cairo appears to be the biggest loser from the secession of the South. Its loss is not limited to Nile waters, though these are the most crucial, but also extends to other interests, such as the reduction of its strategic security depth to the south, the direct impact on its security, role, and regional standing, in addition to the potential risk of contagion spreading to other areas in the North, geographically and culturally closer, and perhaps even within its own territory[31].

Conclusion and Findings

Through the discussion of the preceding themes, we reached the following conclusions:

- It is evident that the secession of South Sudan will have significant effects on Arab–African relations, and even on Arab–Arab relations, as in the case of Sudan's relations with Egypt. Secession will lead to further complications regarding the water crisis in the Nile Basin, and the establishment of a recognized state in South Sudan will have profound legal and political consequences.
- The creation of the State of South Sudan casts negative repercussions on Sudanese national security as well as Arab national security. Such a step may encourage other ethnic groups and regions in Sudan and the Arab world to pursue secession, thereby creating instability, paralysis, fragmentation, and division. Consequently, colonial powers will use South Sudan as a base to implement their strategy of striking the entire Arab region and reshaping it to serve colonial interests.
- From the perspective of security threats, the establishment of the State of South Sudan poses a threat to Arab water security, as a new state will join the system of Nile Basin countries. This will threaten the safeguarding of Sudan's and Egypt's interests in the Nile waters through the likely alignment of South Sudan with upstream countries in their struggle with the downstream states, Sudan and Egypt. This aims to establish a new formula to govern their conflict with the two downstream countries.
- The addition of South Sudan as a new state to the system of Nile Basin countries threatens to secure Sudan's and Egypt's interests in Nile waters through its anticipated alignment with upstream countries, within the framework of their conflict with the two downstream countries, Sudan and Egypt, aiming to create a new formula for water distribution among the basin states.

Proposed Recommendations

- Activate the Arab League by granting it the full capacity to fulfill its role in serving joint Arab action.
- Activate **water diplomacy**, which is one of the new and non-traditional forms of diplomacy, in order to mitigate the harm of the Renaissance Dam on Egypt's water security. This can be achieved through negotiation rounds and intensifying bilateral visits with Nile Basin countries, whether at the presidential or ministerial levels.
- Egypt must adopt a **cooperative approach** (political, security, economic, and cultural) with the Nile Basin countries in particular and with Africa in general, as this constitutes one of the pillars of Egypt's water and national security.

- Work on gaining and securing Sudan's support as a strategic partner in negotiations and as a depth for Egyptian national security, especially since South Sudan supports the construction of the Renaissance Dam.
- Build a strong Egyptian economic base to be used and invested in its relations with African countries, serving as an element of attraction, alignment, and containment for those states. This would allow Egypt to play an influential and effective regional role on the African level.
- Intensify political and diplomatic efforts at the highest levels to strengthen regional and strategic alliances with groups of countries within African regional zones.
- Work on preparation, coordination, and cooperation within the framework of strategic partnerships with active states in the African scene, which have interests and influence in the continent, such as the United States, China, and France.

Final Note

The **Arab African Summit** constitutes an appropriate mechanism to strengthen Arab–African relations, provided that it is reinforced and founded on the principle of strategic partnership between Arabs and Africans under the conditions of equality, reciprocity, and mutual benefits, with the aim of safeguarding regional peace in Africa and advancing economic development.

This requires that Arab national security be a comprehensive, coordinated, and consultative process supported by genuine Arab efforts to build the national security system that is sought.

Finally, it can be said that the strength of Egypt or any Arab country lies in its unity and alliance against the conspiracies being devised against it, given the immense resources and economies it possesses, which can achieve economic and social security, ultimately leading to the realization of political and strategic security for the construction of a comprehensive Arab security system.

Keywords Career Plateau; Work Environment; Confront strategies.

Abstract
This scientific paper aimed to explain the concept of "organisational plateau" through a set of theoretical approaches, employing a descriptive-analytical method. The researcher concluded that there is a point where an employee finds their profession easy and not challenging, facing fewer opportunities to develop their skills and abilities. They also experience limited vertical and horizontal movement in their career path, which makes them find no passion or purpose in it, looking forward to only two things in their work: "the end of the workday and the salary transfer." Most employees aspire to grow in their career paths and reach new levels of success. Still, when new challenges and opportunities become unclear, boredom or frustration may creep into the work environment, leading to negative repercussions for productivity, job satisfaction, overall happiness, and mental health. So, what is the meaning of the career plateau? And what are the strategies to confront it in the work environment?

Introduction:

The career plateau has become a widespread phenomenon in many organisations today, exacerbated by the complexity of their functional organisational structures. It is considered a major problem within organisations as it increases employee frustration and ultimately affects organisational performance. Often, institutions follow a hierarchical structure for promotions, where the number of senior positions is limited, and this is a primary reason for reaching a career plateau. Researchers have recognised the serious impact of career plateauing on an organisation and its effectiveness, including its effects on the quality of work life. This has led to the study and analysis of human resource management practices in organisations aimed at fostering a better career life.

As human resource managers specifically strive to confront pressures and conflicts by creating and continuously developing a suitable and successful work environment—making it more positive for both the business and its

employees—their goal is to increase motivation, efficiency, and satisfaction. They also aim to help employees adopt positive behaviors in the face of challenges and pressures by emphasising equal opportunities for promotion and incentives, which significantly impacts the quality of work life. By also helping them to interact with management, identify and positively address shortcomings, and utilise and develop their abilities to increase performance and productivity, management has become aware of the career plateau's effects on the quality of work life.

1- The Concept of the Professional Plateau:

Changes in the business environment, such as restructuring, the flattening of hierarchical organisations, and downsizing, have led to an increasing number of individuals who see fewer opportunities for future promotion. Consequently, a large number of employees reach a plateau at an early stage, which narrows the path of career development and delays future promotion opportunities. Employees retain their positions for longer periods with little probability of advancement or an increase in job responsibilities. The concept of a career plateau refers to the lack of ability or desire to move to a higher level due to low professional or technical skills. Others may refuse a promotion because they feel bored with their current job, despite having the competence and ability to perform well.

Several definitions have been provided for the term:

- **Ference, Stoner & Warren (1977)** defined it as: the point or stage an employee reaches in their career path where opportunities for promotion are low or almost non-existent.
- **Cable (2012)** defined it as: that point where it becomes painfully clear that further career advancement is blocked for any of a variety of reasons (Khadir & Shaher, 2021, p. 59).
- It has also been defined as: a state that can cause discomfort among employees due to the lack of continuous upward progression, which is considered a standard for measuring employee performance, consequently leading to poor performance (Hussein & Hussein, 2021, p. 840).

The term "career plateau" is also synonymous with "career stagnation," which is defined as the stage or point in a career where an individual cannot obtain further promotions and advance up the administrative ladder.

- **(Khadir & Shaher, 2021, p. 59)** defined it as: a point in a job where the probability of upward promotion is low.

From the preceding definitions, it can be stated that a career plateau is a situation in which an individual experiences a lack of challenges in their job, faces limited opportunities to develop their skills and abilities, and has restricted vertical and horizontal movement in their career path (Kadid et al., 2021, p. 655).

The researcher concludes that the career plateau indicates a lack of ability or desire to move to a higher level due to low professional or technical skills. Others may refuse a promotion because they feel bored with their current job, despite having the competence and ability to perform well.

The career future of employees in an organisation can be classified into several main categories:

- **Learners:** These are employees with a high probability of promotion and advancement, but whose performance level is below the established standard, such as new trainees or recent hires.
- **Stars:** These are employees who perform outstanding work, achieve high levels of performance, and have high aptitude and probability for continued progress and growth. These are the fast-tracked individuals on their career paths (Bouzorine, 2018, p. 63).
- **Ineffective Employees (Deadwood):** These are individuals whose performance is unsatisfactory and who have no opportunities for promotion within the organisation, as illustrated in the table:

  Table No. (01): Illustrates the classification of the career future for employees in the organisation

Current Performance	Future Promotion Potential	
	Low	High
High	Established or professionally stable employees (3) (Effective stagnation)	Stars (2)
Low	Employees at career end (4) (Ineffective stagnation)	Learners (1) (Newcomers)

Source: Al-Salem & Saleh (2006).

Naturally, the organisation prefers all its members to be stars or effective, stable individuals, but the challenge it faces is:

1. Transforming newcomers or recent hires into stars or members of the group characterised by effective career stagnation.

2. Preventing stars and individuals with effective career stagnation from declining into the group of the functionally terminated or those of no use to the organisation (Bouzorine, 2018, p. 64).

2. The Importance of the Career Plateau in Organisations:

1. The career plateau is not a new phenomenon; however, the issue of concern is the rate at which it has become widespread in many organisations due to changes in the business environment, restructuring, downsizing, and reduced job opportunities. The career plateau will likely become one of the most significant career issues in the coming years.

2. The lack of advancement opportunities in professional life—as individuals do not progress up the hierarchical ladder as quickly as they desire or according to their skills and experience—combined with social, economic, and demographic pressures, causes a career plateau for a larger number of employees, often at younger ages.

3. The career plateau is an important phenomenon, and many demographic, organisational, and economic factors will likely lead to a significant increase in its occurrence in the future. Greater service demands, more complex technologies, and shorter product life cycles have necessitated more horizontally oriented organisational structures, with fewer jobs available for the upward movement of employees in the organisational pyramid.

4. Mergers and acquisitions have also been a reason for reducing the number of employees, which ultimately leads to career plateaus.

5. The career plateau has received an increasing amount of attention from researchers as promotion possibilities within organisations have become more limited. Recent decades have seen a growing interest in investigating why employees leave an organisation. However, knowing the reasons for leaving a job comes too late to stop the act of leaving and to discover the intention to leave. Certain analysts estimate that 70% of employees are already in a plateau state, while others believe the rate could be as high as 90% in later years, and that the chances of getting a promotion or a salary increase are very limited. Thus, the initial job we dreamed of becomes less attainable (Hussein & Noha, 2021, pp. 841-842).

3. Causes of the Career Plateau:

1. **Subjective Causes:** Individual factors such as age, locus of control, educational level, lack of skills, and ambition. Family factors range from family satisfaction and size to the partner's type of work. Low personal skills and abilities among employees and their negative repercussions on performance result in negative evaluations from their superiors, making promotion opportunities in their career paths non-existent.

2. **Weak incentive systems** lead to a decrease in employee motivation.

3. **The way employees perceive organisational phenomena and variables** is an important factor in diagnosing their career path and, consequently, an influential factor in their falling into a career plateau (Al-Tawati & Benyamina, 2024, p. 655).

4. Theories Explaining the Career Plateau:

4.1. Herzberg's Two-Factor Theory: In the early 1960s, Herzberg conducted research on 20 accountants and engineers in Pittsburgh to determine what drives an individual to perform and their level of job satisfaction. Through his analysis of their responses, he identified two different sets of feelings at work (feelings of satisfaction and feelings of dissatisfaction).

- **Motivation Factors:** These include: (Achievements - Recognition from colleagues and management - The work itself - Advancement and promotion - Responsibilities - Growth).

- **Hygiene Factors (causing dissatisfaction):** These are factors that protect and maintain the individual but do not motivate them to work. Their absence leads to severe dissatisfaction with the work. They are: (Company policy and procedures - Supervision - Relationship with superiors and subordinates - Personal life - Social status - Job security). These are causes of satisfaction and dissatisfaction. The factors related to satisfaction, if present, lead to satisfaction, and in their absence, the individual will not be satisfied. As for the factors related to dissatisfaction, if they are met, dissatisfaction will disappear, but if these factors are absent, the individual will be in a state of dissatisfaction (Al-Tawati & Benyamina, 2024, p. 656).

From this, it is worth saying that the working individual is subject to a set of factors that eliminate dissatisfaction, which can be called "hygiene factors," where there is neither satisfaction nor dissatisfaction, such as (salary, organisation's policy, job security, nature of supervision and guidance, social relations within the organisation). As for the set of factors that achieve satisfaction, they are called "motivators," which are linked to the components of the work itself and are represented by the ability to achieve, clarity of the individual's responsibility in the work they do, performing work of value to the organization, opportunities for advancement and growth in the work, etc.

It should also be noted that Herzberg believes that increasing performance levels does not lie in specialisation and division of labor, but requires the organisation to enrich jobs. This means making the work more complex with a margin of autonomy and responsibility, not only at the level of execution but also at the level of control. In addition, motivation is linked to desirable work (motivation), which leads to stimulating the individual's creative energies (professional competence).

In this context, Herzberg says that meaningful work is what leads to increased performance. This means that job enrichment helps individuals to drive possible improvements at the level of work organisation within the company.

4-2- Argyris's Theory of the Conflict Between the Individual and the Organisation:

Argyris (1957) criticised formal organisation in its classical sense, believing that the legitimacy of organisations stems from their ability to address complex societal problems, comprehensive needs, or future goals that individuals cannot solve or undertake on their own. He views organisation as a civilizational innovation that humanity has developed over its long journey in facing life's difficulties. In his analysis, he posits that the smallest nucleus in the organisation, the individual, is itself a complex organisation. Consequently, every organisation is a large collection of complex systems. Organisational energy is only generated when it is charged with human energy that enables it to grow and contribute.

Argyris points to the contradiction between the needs of individuals and the requirements of the formal organisation, considering it a pathology that threatens the organisation because it leads to suppressing individuals' drive, curbing their desires, or hindering their growth by programming their behavior and standardising their movements. This affects their attitudes, inclinations, ways of thinking, and lifestyle, which in turn generates frustration, conflict, and anxiety. This leads to the spread of hostile and defensive behavior among individuals, reduces their efficiency, increases labor costs, and ultimately causes the organisation to fail and decline. This

prompted Argyris to propose a set of mechanisms that he believed could reduce these contradictions, the most important of which are:

1. Replacing the traditional thinking of organisations with contemporary ideas.
2. Relaxing formal, hierarchical, and control-oriented methods.
3. Adopting a leadership focused on individuals rather than on production.

Assumptions of the Theory:

1. The needs and desires of individuals are inconsistent with the needs of organisations in many societies.
2. The organisation's needs are represented by the goals for which it was founded. These can be achieved if employees adhere to the roles and plans set for them by management. However, these roles result in frustration for individuals, placing them in a cycle of anxiety, conflict, and failure.
3. Stronger individuals tend to gather in informal relationships and practices to reduce anxiety and management pressures and to mitigate intrusive control and supervision procedures. These informal practices become necessary if the organisation wants to meet its minimum requirements.
4. The conflict between individuals' inclinations for self-integration and integration with others on the one hand, and their integration with the organisation on the other, create patterns of behavior that can be defensive, aggressive, or adaptive. This causes some employees to flee, while others rise to higher positions on the hierarchical ladder, and the rest tend towards isolation, avoiding all causes of anxiety and harm, thus failing to gain the satisfaction of either their colleagues or the management.

4.3. Maslow's Hierarchy of Needs Theory:

The hierarchy of needs theory is considered one of the most widespread motivation theories due to its ability to explain human behavior in the quest to satisfy various needs. Maslow assumed that once a human need is satisfied, it no longer serves as a motivator for behavior. Therefore, it is the unsatisfied needs that affect an individual's behavior and motivation, and the needs at the bottom of the pyramid must be satisfied first.

- **Physiological Needs:** These are the needs for which an individual works to earn a wage to satisfy their need for food and drink.
- **Safety Needs:** After satisfying physiological needs, a person seeks security to protect themselves from dangers in their natural environment and surroundings.
- **Social Needs:** This is the need to form social relationships with members of society to gain the ability to face risks.
- **Esteem Needs:** This is represented by the individual's need to gain the respect and esteem of others.
- **Self-Actualisation Needs:** This need is located at the top of the pyramid and involves achieving one's full potential through accomplishment and creativity (Al-Tawati & Benyamina, 2024, p. 658).

5. Dimensions of the Career Plateau:

5-1. Structural Plateau:

This arises when an individual remains at a certain point from which it is difficult to move further for several reasons, including the lack of vacancies at higher levels, not possessing the necessary skills and abilities, an increase in the number of employees qualified for promotion, a high number of graduates, the introduction of modern technologies at work, and intense competition among employees. Consequently, opportunities for vertical promotion become scarce. This plateau is a natural result of the hierarchical structure of organisations and the low number of jobs compared to the number of employees aspiring to be promoted to higher levels. Age can be one of the most significant factors causing this plateau if the organisation decides to appoint younger employees based on the belief that older workers have a lower capacity for learning and performance, and a reduced desire to develop themselves.

5-2. Job Content Plateau:

This occurs when an employee has experience and knowledge of their current job and performs it optimally, making it difficult for them to obtain new responsibilities. This can lead to feelings of frustration, loss of enthusiasm, low job satisfaction, weak commitment, a lack of career goals, and decreased productivity.

As Salameh (2010) indicates, the content plateau is facing a significant decrease in the level of challenge, learning, and interest in the work. The individual remains in their current job, but time passes without any change to that job or its responsibilities and tasks, leading to feelings of boredom and a lack of challenge, eventually resulting in frustration and despair.

5-3. Personal Plateau:

In this type of plateau, employees lose their desire for a higher job level either because they lack the professional and technical skills or because they possess the skills and abilities but do not wish to be promoted.

This plateau is considered the most dangerous type because the employee lacks motivation and enthusiasm in most of their work-related activities due to intrinsic factors affecting their feelings. A kind of deficiency arises in the individual's capabilities to take on a higher-level job due to work pressure or family commitments. The life-career plateau is one of the factors that contributes, to some extent, to the occurrence of the personal plateau (Khadir & Shaher, 2021, p. 62).

6. Definition of the Work Environment:

It is the set of mutual relationships between employees, employers, and the environment in which they work, which can be positive or negative. Positive work environments provide enjoyable experiences for employees that help them achieve their personal goals, while negative work environments provide painful experiences and reduce good employee behavior at work. Irresponsible or uncommitted employees can change to become responsible and more committed to work in a positive work environment because such environments enhance their self-actualisation traits, whereas the opposite may be true in a negative environment (Maghribi, 2022, p. 94).

7. The Importance of the Work Environment:

There is no doubt that an ideal and encouraging work environment is a fundamental component for the success of any institution in the 21st century. The following points highlight the importance of an effective work environment in several key areas:

- **The Ability to Build a Competitive Advantage:** For an organisation to survive and grow, it must have the ability to remain competitive. This is achieved by building a competitive advantage, which Ali Al-Sal'i defines as "the distinct skill, technology, or resource that allows the organization to produce benefits for customers that exceed what competitors offer, from the customers' perspective, who accept this difference and distinction as it provides them with more benefits and values that surpass what other competitors offer" (Ghazi & Al-Anaz, 2021, pp. 437-438).

- **The Greatest Investment is in Human Resources:** The field of human resources has recently witnessed significant attention, particularly a broad consensus on development and training processes. This is due to the strong conviction from management that an organisation cannot achieve its goals otherwise. Human resources has become an important part of intellectual capital, representing the knowledge, skills, and abilities possessed by individuals. Human capital is usually reflected through individuals' education and experience, as well as through specific skills they acquire.

- **Increasing the Organisation's Financial Return:** Numerous global studies have proven a close correlation between the financial return of companies and the job satisfaction of their employees. Therefore, the ultimate goal should be to provide an ideal work environment that primarily aims to increase employee productivity. This, in turn, contributes to raising the level of customer satisfaction, leading to the achievement of the best financial and non-financial returns, where everyone is a participant in the profit.

- **The Work Environment is the True Mirror of the Company:** When internal customers, or human resources, are cared for through effective management (a good wage system, fair incentives, a positive organisational climate), this is reflected in job satisfaction and high morale. This, in turn, is reflected in the organisation's good performance, which achieves quality in services and production, giving a good image of the company. As stated in Al-Qahtani's (2001) study on the impact of the internal work environment on organisational loyalty, there is a relationship between the work environment and organisational loyalty in the researched institution.

- **Increasing Productivity and Improving Quality:** In this regard, Ken Blanchard says, "American managers quickly discovered that the cornerstone of many Japanese work programs is the approach of empowering employees to make decisions related to their work." For example, quality circles—groups of employees who meet regularly to come up with ways to improve the company's performance—became a common Japanese method for participation in decision-making. The decisions made by quality circles receive the attention and appreciation of senior management (Maghribi, 2022, p. 94).

8. Dimensions of the Work Environment:

8-1. The Economic Dimension:

This is not only at the level of the company or organisation but at the level of the country as a whole. The more efficient the workers, the more the economy of the society and the country progresses. This is embodied through cost. Usually, all labor costs are borne by the organisation itself, such as work injuries, salaries, wages, and compensation, as well as resolving issues of temporary and permanent disability. The national economy is negatively affected when an organisation pays significant expenses for accidents and injuries, because it spends most of its budget on corrective measures and treatments rather than on its core operations that would contribute valuable outputs to society. Consequently, all its expenses will go towards satisfying the work environment's needs to be capable of making more contributions.

8-2. The Human Dimension:

When a worker in an organisation or company suffers an injury, it hinders the overall output process. It also affects their personal life, as they may be left with a disability, unable to work to support their family. This can lead to frustration, even if they recover in the future. They may no longer want to work unless the responsible

company intervenes and supports their family, or at least pays them half their salary to raise their morale and encourage a speedy recovery. This way, the company will not incur excessive expenses.

8-3. The Healthy Work Environment:

To ensure a healthy work environment, a company should provide the following:

Continuous development of the organisation or company to keep pace with the times, especially in implementing prevention and safety measures for employees.

Reviewing the output and production processes to ensure they are sound and do not cause harm, and inspecting them throughout the month to continuously correct faults, to reduce work accidents and injuries, and to increase production more quickly and without any obstacles.

If more comfortable and safer equipment is found than what is currently available, it is preferable to purchase it to provide the utmost safety and comfort for workers.

Training and qualifying workers and employees for any potential future risks and how to deal with them, and providing them with courses in first aid, so that employees pay more attention to following prevention and safety procedures when using machinery and equipment (Aker, 2020, pp. 30-31).

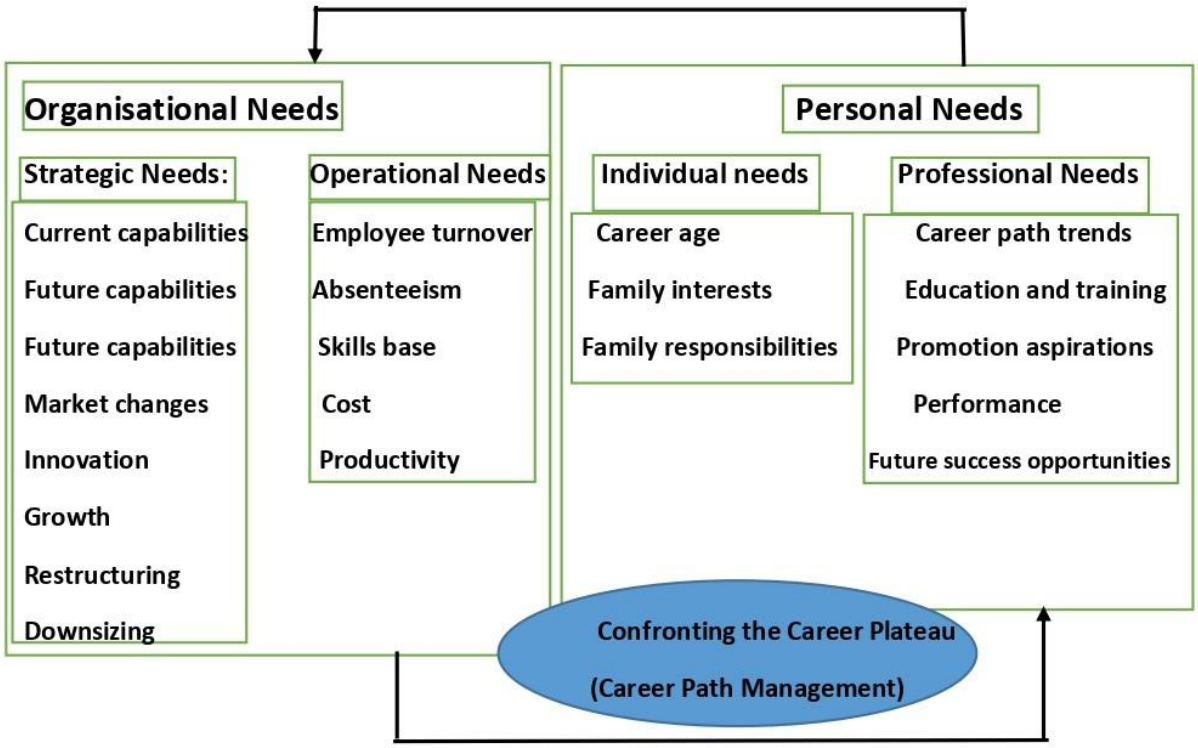
6. Strategies for Confronting the Career Plateau in the Workplace:

This section aims to clarify some frameworks as alternatives for addressing employees affected by the career plateau, which can be listed as follows:

1. Aligning Personal and Organisational Requirements to Address Career Plateau Cases:

Confronting the career plateau requires creating an alignment between personal and organisational requirements. Organisations typically aim to create harmony between the organisation's needs and requirements on one hand, and the desires and requirements of employees on the other, when designing career paths. Consequently, linking career paths as a basis for career movement with career plateau situations, which may be a part or a stage of these paths, is essential. All of this requires the organisation to conduct up-to-date studies and research in all areas of human resource policies in general, and career paths in particular. Reference can be made to the study of (Bohlander & Snell, year) to provide a clear idea of this stall, as is evident in Figure (02):

Figure No. (02): Illustrates the alignment between personal and organisational requirements to confront career plateau cases:



Source: Mohammed (n.d.,p09)

Achieving adaptation and compatibility between the organisation's requirements and the individual's needs is not easy, as it requires depth of thought and the ability to link and analyse various human resource policies. These include quantitative and qualitative human resource planning, developing the capabilities of these resources, policies of recruitment, selection, and appointment, as well as job analysis and evaluation, performance appraisal, monitoring and studying promotions, job evaluation, and determining wages, rewards, and incentives, among others. All of these factors influence the determination of career paths in one way or another. Therefore, organisations are forced to change their directions and alter their human resource strategies to achieve compatibility with these changes. Accordingly, the existence of goals is a requirement for achieving effectiveness and success. Organisational needs must also be linked to personal needs in a way that contributes to achieving employee satisfaction and the organisation's strategic goals simultaneously. Furthermore, creating this alignment between personal and organisational needs with the aim of managing them and helping employees face them requires a role from the organisation and another from the employees, as follows:

1. **Develop integrated human resource plans** that consider the organisation's needs and its future aspirations for human resources.
2. **Design career paths** and create a guide for different paths, dual paths, and network paths.
3. **Define career paths** and identify a source for counselling to assist employees in determining their career paths in a way that aligns with the organisation's requirements.
4. **Appoint individuals with high competence and experience** in career planning within the human resources management framework to assist employees and provide them with advice and counsel to help them choose the best possible paths.
5. **Adopt employee performance evaluation systems and programs** to identify their potential and capabilities and develop them to ensure they find the best job opportunities within the defined paths in the organisation, with integrated feedback on the results of employee evaluation and the changes they undergo during their career progression to map their future without advancement.
6. **Use succession and replacement charts** within the scope of human resources management to identify the best replacement and to determine the organisation's available and potential human resources.

These replacement charts help in finding alternatives quickly and at a lower cost, and lead to identifying areas of weakness among employees to address them.

7. **Design or redesign jobs**, as well as continuously update job descriptions after analysing current jobs and their components, to create important new jobs or eliminate others, and to align employees with their jobs, and to help in selecting the best employees based on their qualifications for the jobs to be filled.

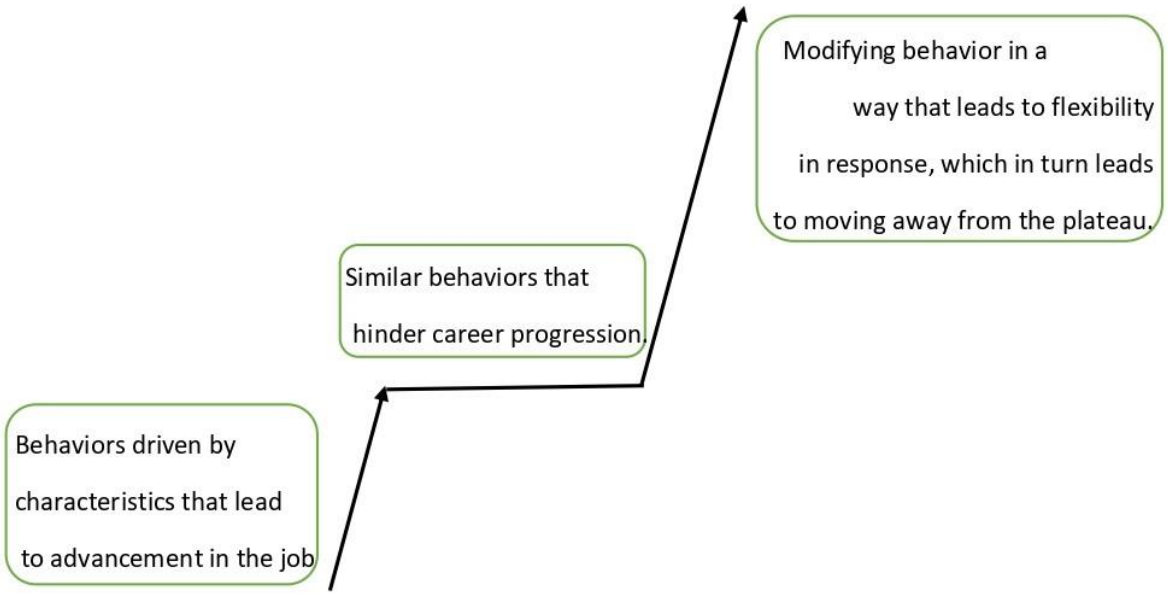
8. **Continuously inform employees** about vacant positions, available job opportunities, and the requirements to obtain them promptly so they can adapt themselves and know their qualifications and abilities to advance in their career paths.

9. **Provide employees with opportunities to learn**, whether through various training programs or by giving them the chance to complete their academic and university education in a manner that suits their abilities and the organisation's needs. Training can be on-the-job, within the organisation, or even outside it.

10. **Encourage employees to train and learn outside the organisation** and in advanced organisations to gain high-level experience that qualifies them for higher positions, as well as to provide new competencies and capabilities that the organisation needs.

11. **Build a new organisational culture** that adopts modern human resource management policies and their reliance on investing in and developing human resources. Also, build a culture that commits the organisation's leadership and senior management to teaching, guiding, and providing advice to employees to develop and prepare them for senior positions. Within these areas that compel the organisation to change its direction, a fundamental issue arises, which is what happens after employees fall into a career plateau and the necessity of changing behaviors to face this situation. Basic areas for confronting it have been identified, as is clear in Figure (3).

Figure 3: Illustrates the stages of the career plateau.



Modifying behavior in a way that leads to flexibility in response, which in turn leads to moving away from the plateau.
Similar behaviors that hinder career progression.
Behaviors driven by characteristics that lead to advancement in the job

Source: Mohammed (n.d, p 14).

From Figure (3), we notice the development of awareness among employees, the dismantling of poorly adaptive behaviors, and the identification of attitudes towards this type of behavior. Then, behaviors and attitudes that achieve flexibility in response are built and rebuilt to improve performance in a way that enables the measurement of this problem's existence and helps in avoiding it.

Through all this, we conclude that 3 actions can help in managing the process of career stagnation:

1. **Preventing the problem from occurring:** This means preventing career stagnation from turning into ineffective stagnation by helping individuals who are functionally stagnant or static to adapt themselves to be in the group of individuals with effective career stagnation.

2. **Improving follow-up and supervision:** This is to detect the problem as it appears, meaning the integration of information systems related to the individual's career life. This can be achieved through a performance appraisal system that should encourage open communication between the individual and their superior.

3. **Treating the problem as soon as it appears:** This means dealing with individuals with career stagnation or who feel frustrated in an effective manner (Bouzorine, 2018, p. 65).

09- Alternatives for Treating the Career Plateau:

The most important steps for treating the career plateau are as follows:

- Analyse problems and identify the employees likely to be affected by them.
- Communicate with employees through constant contact to understand their desires in line with the organisation's interests.
- Determine what the organisation wants and what the employees want.
- Make decisions to resolve conflicts among employees to determine precedence for promotion and advancement opportunities.
- Control the management of employees' interests within the organisation and manage the employees.
- Identify the personal competencies of employees at all different levels.
- Invest the available time in devising the best methods for employee advancement and outlining the steps needed to face mid-career problems, in which we see employees plateauing, and to be prepared for it in advance.
- Draw up strategies to face mid-career problems and personal and family issues that may confront employees and organisations with unforeseen or unstudied problems as much as possible (Al-Sultani, 2015, p. 255).

Some ways to overcome career stagnation as mentioned in: https://www.dztecs.com/career/what-is-career-stagnation-and-how-to-overcome-it

1. **Have a clear career goal:** One of the reasons individuals do not discover stagnation in their careers early enough is the lack of a clear career goal. Many candidates are asked the following question in a job interview: Where do you see yourself in 3–5 years? But they have no answer because there is no career goal in the picture. Everyone just wants to go with the flow.

2. **Look for new challenges:** It is easier to slip into career stagnation when you lose all enthusiasm for your professional role, and it becomes mundane. You can approach your manager or project leader and ask for a new challenge.

3. **Stay informed about industry changes:** Every year, we see technological advancements and improvements in various industries. Individuals who are not aware of the changes in their industry will find it difficult to cope with their profession.

4. **Update your skills:** Acquiring skills is part of an effective personal development plan and an integral part of career growth. Updating your skills is essential to match the competition in your chosen career. You may have started with a basic certificate in the banking or IT sector. To be at the top of your game, you need to acquire relevant skills and certifications that will help you climb the ladder.

5. **Build some relationships:** Networking with people in the same sector can open up opportunities in your career. When you rub shoulders with great people in your field, you learn and become privy to information you would not have otherwise been exposed to.

Conclusion:

In conclusion, the researcher deduces that the career plateau is an organisational phenomenon with negative repercussions on productivity, job satisfaction, happiness in life, and mental health in general. However, deterring and confronting it relies primarily on the organisation's strategies for investing in and preserving its human resources. This is achieved through motivation processes, improving the work environment, and providing everything that would increase achievement motivation. It also involves building a good organisational culture that adopts modern human resource management policies and their reliance on investing in and developing human resources. Furthermore, it includes building a culture that commits the organisation's leadership and senior management to teaching, guiding, and providing advice to employees to develop them and prepare them for senior positions. Within these areas that compel the organisation to change its direction, a fundamental issue arises, which is what happens after employees fall into a career plateau, and the necessity of changing behaviors to face this situation. Key areas for confrontation have been identified, which are replacing the traditional thinking of organisations with contemporary ideas, relaxing formal, hierarchical, and control-oriented methods, and adopting leadership focused on individuals rather than on production.

Keywords Stuttering, fluency disorder, factors, causes, theories

Abstract

Stuttering represents one of the most common language disorders among children, and it affects the flow and stream of speech, thus leading to a disruption in its smoothness such as repetitions, blocks, and pauses. There are accompanying disorders like fear and confusion, feelings of embarrassment, and avoiding talking to others, along with the issuance of involuntary body movements.

Many researchers have given scientific explanations for fluency disorder, and therefore in this research, we will try to highlight the most agreed upon and confirmed theories through research and studies. Thus, the most important theoretical approaches in explaining the stuttering disorder will be presented, which can be classified into three main axes: organic factors (biological and neurological), psychological and emotional factors, and environmental and social factors, as follows:

The biochemical theory, the neurological theory, the cerebral dominance theory, the neurotic theory, classical conditioning, the required capacities theory, the behavioral theory, the genetic theory, the anticipatory struggle theory, and finally the theory related to environmental and social factors.

Introduction

Stuttering represents a disorder in the fluency and smoothness of speech, and it affects the individual's ability to speak fluently. It is characterized by various manifestations such as repetition of sounds, syllables, or words, in-

voluntary pauses during speech, and may be accompanied by other physical symptoms that can create psychological problems for the individual.

Although stuttering usually appears in early childhood and continues into adulthood, its causes are still not fully understood and are subject to many theories and scientific studies.

Research, to the extent of my knowledge, indicates that the causes of stuttering may be a mixture of genetic, neurological, behavioral, psychological, and environmental factors. Genetically, the likelihood of stuttering increases in individuals who have a family history of this disorder. From a neurological point of view, differences have been observed in brain activity in people who stutter, especially in areas responsible for speech production and muscle movement coordination. Psychological and social factors also play an important role, as anxiety, psychological pressure, or difficult social situations can worsen stuttering.

In addition, behavioral factors such as reinforcement and punishment affect the appearance of stuttering, which is considered a learned behavior. Some environmental factors, such as high expectations from the family or school, may contribute to the increased severity of the disorder.

In this article, we will explore in detail the possible factors causing stuttering and discuss the latest scientific theories that attempt to explain this disorder, which contributes to a deeper understanding of its nature and helps in determining the best methods of treatment and support.

Problematic:

Stuttering is considered one of the most common language disorders among children, especially in the preschool age, where the disorder affects verbal fluency or speech flow. It is characterized by repetitions, prolongations, pauses, and hesitations—often at the beginning of the word. Stuttering is accompanied by physical symptoms such as changes in facial parts like trembling, lip pressing, and head movements... It is also accompanied by respiratory problems like the inability to differentiate between inhalation and exhalation, in addition to psychological symptoms such as anxiety, shyness, and withdrawal behavior.

Stuttering occurs at the age of six in about 80% to 90% of affected individuals, the disorder may appear gradually or suddenly, and usually, fluency difficulties begin gradually with repetition of phonemes, syllables, and the first words of the sentence. The child may not be aware of the fluency difficulties at first, but as the disorder progresses and develops, the child becomes aware of the speech difficulty and may develop mechanisms to avoid these difficulties.

Fluency disorder can also be accompanied by motor movements, for example: eye blinking, tics, trembling of the lips or face, head movements, breathing movements, and hand clenching. Children who suffer from early-onset fluency disorder show a set of linguistic abilities. (Awda & Fakiri, 2016, p.70)

According to the ***Ooreka*** website, stuttering is a speech disorder characterized by difficulty in pronouncing or sequencing certain syllables without affecting the vocal organs. Stuttering disrupts speech fluency (normal speech speed is supposed to be around 90 words per minute). This speech disorder is a communication disorder and generally appears when a person tries to speak in front of an audience, whereas when alone, he or she does not stutter. The disorder also disappears in cases of whispering, singing, or imitating an accent.

Van Riper described three main stages of stuttering:

- **Initial Stage**: Characterized by easy repetitions at the beginning of words or syllables in sentences, without any emotional signs or psychological pressure. (Specialists do not consider these symptoms as stuttering.)
- **Secondary Stage**: Characterized by the stutterer's awareness of their speech fluency disruption and attempts to correct it. This indicates the beginning of anticipation and fear associated with stuttering.
- **Transitional Stage**: Appears between the previous two stages and is marked by signs of frustration, surprise, resistance, and avoidance of speaking. These are accompanied by efforts during repetitions or prolongations of words and syllables. The development of this stage leads to the transition into the secondary stage. (Al-Zriqat, 2005, p. 24)

Stuttering affects approximately 1% of the general population, with the majority being children. It is more common in advanced or developed societies than in primitive or underdeveloped ones. It also occurs more frequently in males than females, at a ratio of 3 or 4 to 1. (Kashif, 2010, p. 77)

Many theories have attempted to explain the phenomenon of stuttering. Some attribute it to organic and neurological factors, such as the Cerebral Dominance Theory. Other theories point to environmental, social, familial, and educational factors, such as the Diagnosogenic Theory and unrealistic parental expectations. Still, some theories relate stuttering to psychological causes, including the Psychoanalytic Theory, the Behavioral Theory, and the Neurological Theory, while others associate it with genetic factors.

Accordingly, this topic aims to answer the following question:

What are the common theoretical approaches to explaining stuttering disorder?

Numerous theories have attempted to explain stuttering, and they can be categorized into three main areas:

1. **Organic factors** (biological and neurological)
2. **Psychological and emotional factors**
3. **Environmental and social factors**

Each of these areas includes several theories that we will explore in the following sections.

First: Organic Factors (Biological and Neurological): Include the following:

1. The Biochemical Theory:

The theory of Robert West (1958) is one of the theories that attributes the origin of stuttering to organic causes. He believes that the phenomenon of stuttering appears during childhood and that it is more common among males than females. West believes that there are disorders in the metabolic process (which is the process of breaking down and building up the chemical composition of the blood) in people who stutter. Therefore, he considers stuttering a type of convulsive disorder similar to epileptic seizures due to several shared aspects, including:

- Both are convulsive disorders
- Both are more common among males than females,
- Both are affected by intense emotions,
- The importance of genetic and familial factors for both,
- Both are reflections of fear, which leads to the occurrence of the disorders. (Amin, 2017, p. 20)

Therefore, the biochemical factor has an effect on the emergence of fluency disorder.

2. The Neurological Theory:

Several neurological studies have shown that stuttering results from a deficiency in neural processing, including the study by Chang et al. (2011), which showed that the person who stutters suffers from a deficiency in transmitting white matter in the brain regions responsible for language and verbal production. Also, the deficiency in connectivity between the inferior frontal gyrus and the premotor cortex in the left hemisphere is neurologically linked to stuttering.

According to Cykowski et al. (2010), the brain dysfunction in stuttering lies in a deficiency in the formation of the myelin sheath of white fibers in the areas responsible for verbal language. The myelin sheath that surrounds the nerve axons develops during the first years after birth. This growth period explains transient stuttering, while chronic stuttering results from a failure in forming the myelin sheath (Packman, 2013, p. 209).

The process of forming the myelin sheath is the covering of nerve axons with a protective sheath, where it was observed that covered nerve axons can transmit impulses efficiently and quickly to the speech centers in the brain compared to axons that are not fully covered. This leads to speech output characterized by rhythm disturbances, repetition, and fragmentation. (Amin, 2017, p. 21)

Research findings indicate that the brains of people who stutter function differently to those of control participants for speech and language tasks, compared to control participants, people who stutter have over-activation in areas of the right hemisphere and under-activation of some areas in the left hemisphere when performing the same speech tasks. (Nang, 2012, p.15)

We conclude that any changes in brain formation, deficiencies in a specific function, or immaturity in some necessary parts—all of this disrupts speech fluency.

3. The Psycholinguistic Theory:

This theory was proposed by Perkins, Kent, and Curlee in 1991 regarding stuttering. It is a comprehensive theory that addresses fluent speech production, speech characterized by stuttering, and speech interruptions that are free of stuttering. In general, two components are required for the production of stuttering: the linguistic or symbolic system and the parallel or signaling system. The brain processes each of them separately and then directs them through a shared output system.

For fluent speech to occur, the system must be timed so that there is coordination and integration between the two, transforming them into the familiar system. If there is no coordination between the two systems, a disruption in speech fluency occurs. This disruption manifests as a loss of control—or the actual moment of stuttering—by the speaker only in the presence of time pressure. Time pressure is defined as the need for the individual to begin utterances, continue them, or accelerate them. In the absence of time pressure, the speech produced appears as nonfluency free of stuttering, resembling the experience of most fluent speakers. (Al-Muaigel & Al-Muaigel, 2022, p. 139)

4. The Cerebral Dominance Theory:

The brain is the engine that controls our actions, movements, and speech. Therefore, any defect in its structure or function leads to a language disorder. It is known that one hemisphere of the brain takes the lead in regulating and controlling speech. If certain factors prevent one hemisphere from dominating and controlling language, both hemispheres will attempt to control the function in an uncoordinated and inappropriate way, which leads to the occurrence of stuttering.

This theory was originally proposed by Orton and Travis in the 1920s. The theory essentially explains that in the brains of individuals who stutter, neither hemisphere dominates speech control. (Kashif, 2010, p. 92)

Orton and Travis add that the speech muscles have bilateral innervation, meaning these muscles receive impulses from both cerebral hemispheres. For smooth speech, the impulses sent from the brain to the muscles must be synchronized, which occurs when one hemisphere (usually the left) takes over monitoring. According to Orton and Travis, individuals who stutter have a deficiency in cerebral dominance, which leads to a disturbance in the rhythm of bilateral motor impulses for speech. (Rondal & Seron, 2003, p. 513)

Travis based his theory on a number of facts, including:

- The brain waves of individuals who stutter are bilaterally equal in shape and amplitude,

- EEG recordings showed harmony in brain activity (in both hemispheres) during stuttering, and the opposite occurs during natural speech,

- There is an increase in latent brain energy during stuttering.

Travis explains these facts by stating that when a person stutters, brain waves in both hemispheres appear similar, and when they speak fluently without stuttering, the waves appear different. A child tends to stutter in speech due to the absence of dominance by one side of the brain in controlling the motor activities involved in speech. (Rakza & Al-Hammadi, 2018, p. 12)

It can be concluded that individuals who suffer from stuttering are characterized by a lack of cerebral dominance, meaning there is no control or dominance of one side over the other.

5. Laterality:

This refers to the idea that forcing a left-handed child to use their right hand instead may cause stuttering. This is because the part of the brain responsible for speech is linked to the part that controls hand movements (the left hemisphere of the brain is responsible for language and the right side of the body, and vice versa). If the individual's neurological and physiological nature is contradicted, it can lead to the emergence of stuttering. (Ben Arbia & Chewal, 2016, p. 60)

In the same context, Orton and Travis connect cerebral dominance with hand use. They started from the observation that in non-stuttering individuals, the left hemisphere is responsible for language and the motor aspects of speech. Forcing a left-handed or ambidextrous person to become right-handed leads to stuttering. Based on this, the researchers explained that the majority of people who stutter are ambidextrous, which explains the deficiency in cerebral dominance.(Rondal & Seron, 2003, p. 513)

Williams (1974) also explains that the brain area responsible for speech control is linked to the area that controls hand movements. Therefore, forcing a child to use a hand they have not previously used leads to a disorder in the nervous system related to speech, which contributes to the appearance of stuttering. (Amin, 2017, p. 19)

We conclude that the physiological and neurological nature of the brain determines the preferred hand, and using a different one affects speech fluency.

6. The Genetic Theory:

There are several viewpoints regarding the relationship between stuttering and heredity—some affirm it, while others deny it. Some believe that stuttering is a genetic predisposition that makes the individual more susceptible to developing it.

According to the CFP website, many studies indicate that individuals who stutter have a family history of the condition. A review of 28 studies by researchers Perez and Stoeckle (2016) estimated that 30% to 60% of people who stutter have a family history, compared to less than 10% in the control group. Male relatives are more likely to be affected than female relatives. Stuttering is associated with changes in the following chromosomes: 9, 10, 12, 13, and 18. Other studies have indicated a link between 9 different genes and stuttering. (Perez, Stoeckle, 2016, p.298)

Regarding twins, stuttering affects identical twins more than fraternal twins.(Rondal & Seron, 2003, p. 514)

In the same context, Espire and Gliford (1983) explain that stuttering occurs due to genetic influence, although this influence ranges from 36% to 65%, especially among first-degree relatives (such as parents and siblings). However, they believe that the hereditary factor is not necessarily based on genetic factors alone, as environmental factors are considered more important. (Amin, 2017, p. 19)

Kang and Drayna (2010) confirm a link between stuttering and genetics, Developmental stuttering appears in recessive genes, particularly on the following chromosomes: 1, 3, 5, 9, 13, 15, 18, and 12. Chromosomes 5 and 15 are associated with persistent forms of stuttering in males, whereas chromosomes 2 and 7 and chromosome 9 are linked to transient stuttering in females. (Monfrais-Pfauwadel, 2014, p.11)

Family studies have identified six candidate causal stuttering genes: GNPTAB, GNPTG, and NAGPA, DRD2; AP4E1; and CYP17A1 However, efforts to replicate these findings in other families or global populations have not yet validated the observed effects. (Below, Polikowsky, Scartozzi, & others, 2023, p.3)

Another study by researchers Riaz, Steinberg, Ahmed, Pluzhnikov, Riazuddin, and colleagues (2005) revealed a strong relationship between genes on chromosome 12 and familial stuttering. In 2006, Wittke-Thompson et al. published a study indicating that chromosome 15 is linked to the persistence of stuttering. Furthermore, stuttering is related to chromosome 7 in males, and to chromosome 15 in females. (Stamurai, 2020)

According to the Diagnostic Manual for Neurodevelopmental Disorders, the risk of developing stuttering among first-degree relatives of individuals with childhood-onset fluency disorder is more than three times higher than in the general population. (Awda & Fakiri, 2016, p. 71)

In 1999, Yairi conducted a study on the information confirming the role of genetic and hereditary factors in the development of speech disorders and stuttering in children. He emphasized that children who stutter are strongly affected by the interaction between age and gender, and that research confirms that a child who stutters is the result of both genetic inheritance and environmental circumstances. Stuttering tends to appear more prominently when there is a family history of the disorder. The researcher rejected the idea of addressing stuttering through spontaneous or natural recovery during childhood. (Kashif, 2010, p. 99)

We conclude that stuttering results from hereditary factors, meaning that the likelihood of developing the disorder varies according to the degree of kinship with the affected individual.

Secondly: Psychological and Behavioral Factors: These include:

1. **Neurosis Theory:**

According to this theory, stuttering is a neurotic disorder that represents a partial personality disorder and is reflected in a speech disorder. Stuttering results from unconscious conflicts, and when the individual attempts to speak, their mouth movements resemble the original breast-sucking movements during infancy. In this regard, Freud states that children have a type of oral behavior, and if they are weaned harshly and early from an emotionally disturbed mother, the child will not naturally satisfy their oral needs. Therefore, those needs remain latent in the form of repression, which later manifests as disguised behaviors such as overeating, fast speech, and other oral forms. (Ben Arbia & Chewal, 2016, p. 61)

The neurosis theory also explains stuttering as an expression of the anxiety experienced by the person who stutters. Neurotic behavior is characterized by unpleasant feelings, the inability to accept them, or the emergence of behaviors expressing them. Anxiety—which constitutes a large part of neurotic behavior—arises when there is a strong conflict between opposing needs, and the individual cannot resolve this conflict. (Al-Jarwani & Seddik, 2013, p. 70)

Freud's theory of neurosis confirms that all neurotic responses are symptoms of unconscious conflict rooted in psychosexual development during early childhood. A child who does not progress normally through stages such as the oral or anal stage, or who is overly attached to one parent (Oedipus complex), becomes fixated at that stage. For instance, early weaning or traumatic toilet training may cause fixation in the oral or anal stage. Later on, psychological conflicts and frustrations begin to appear, leading the individual to regress to early fixation stages. Since behaviors from these childhood stages are socially unacceptable, individuals repress them. However, the unacceptable drives from those stages, once suppressed, are transformed into acceptable neurotic symptoms such as stuttering, fear, or hysterical responses. (Kashif, 2010, p. 109)

We conclude that stuttering is linked to conflicts arising from deficiencies or disruptions in a previous stage of the child's psychosexual development, and this deficiency leads to a disorder in verbal fluency.

2. Classical Conditioning Theory:

The famous Russian psychologist Pavlov found that classical conditioning occurs when a stimulus (punishment) that naturally elicits a response like anxiety is paired with another stimulus (the speaking situation) that does not trigger anxiety. If the two stimuli (punishment and speaking situation) are paired enough times, the speaking situation alone will begin to elicit an anxiety response. The two-factor theory proposes that people who stutter have been conditioned to experience anxiety in speaking situations. This anxiety leads to a breakdown in fluency, which manifests as repetition of part of a word, prolongation of sounds, etc. (Kashif, 2010, p. 108)

Thus, this theory suggests that stuttering is the result of unconditioned failure in speech due to the speaker's anxiety about speaking. If this happens, the person will stutter in any anxiety-provoking situation. Wolpe (1958) viewed stuttering as a symptom of classically conditioned speech fears. Therefore, he treated stuttering using systematic desensitization based on reciprocal inhibition, through which the anxiety response is replaced with a competing response—relaxation.

Sheehan proposed the conflict avoidance theory to explain and treat stuttering. According to this theory, the person who stutters is seen as experiencing a conflict between the desire to speak and the desire not to speak. When the motivation to avoid speaking is strong, the person remains silent. When the motivation to speak is stronger, they speak fluently. When both motivations are equal, the person experiences conflict—resulting in stuttering. Regardless of which motivation dominates (speaking or silence), the individual reinforces the behavior by reducing anxiety. (Al-Zriqat, 2005, p. 239)

It is a need for oral and anal gratification, a latent expression of hostility, suppression of feelings of threat and fear of castration, aggression, and repressed hostility. It is also a tool for attracting attention and sympathy, and a defensive mechanism against threatening thoughts.

Sheehan (1986) distinguishes five levels of conflict as follows:

- **First level:** the word level – The conflict lies in the desire to say the word or not say it.
- **Second level**: the situational level – The conflict is in whether to enter or avoid the fear-inducing situation.
- **Third level:** the emotional content level – The conflict arises from the emotional content of the words as part of vocal features, and is represented in the unconscious drive to avoid speaking.
- **Fourth level:** the relationship level – The conflict is between the person who stutters and the listener.
- **Fifth level:** ego protection level – Stuttering serves as a lifelong defense mechanism that protects the individual from danger.(Rakza & Al Hammadi, 2018, p. 19)

Brutten (1986) believes that stuttering is a disorder of speech fluency resulting from classically conditioned emotional responses in speech. The resulting anxiety leads to speech avoidance. The problem of stuttering arises when a child speaks in a difficult situation, such as during the father's anger. Therefore, stimuli in the child's context—such as sadness—become negative emotional stimuli that later evoke stuttering or its symptoms. (Al-Zriqat, 2005, p. 239)

We conclude that stuttering is linked to classically conditioned emotional responses, associated with anxiety-inducing situations and negative emotions.

3.Behavioral Theory:

Proponents of this theory view stuttering as a learned behavior, either through reinforcement or imitation (a conditioned stimulus: other people's speech). Young children (aged 3–4 years) experience speech fluency disruptions during their early speech practice because they are unable to articulate sounds properly and have a limited vocabulary.

Johnson believes that disfluency coupled with negative listener reactions is the true cause of stuttering. In other words, when a child speaks and stutters, and is harshly criticized by others, this reinforces the disorder and supports its reoccurrence—this is known as the interaction theory.

Behaviorists attempted to explain stuttering as a learned behavior. Some attributed it to its association with a conditioned stimulus (other people's speech), which extracts the stuttering response from the individual. Others attributed it to the reinforcement resulting from stuttering itself, such as drawing attention or concern from others. Still others see it as an avoidance behavior from an undesirable stimulus that causes painful emotions and negative responses such as shyness, tension, or anxiety. As a result, the individual stutters as a way to avoid the pain they experience. (Al-Jarwani & Seddik, 2013, p. 54)

Therefore, it is essential to ensure the development of appropriate behaviors that promote healthy language, focusing on positive aspects of speech and avoiding mistreatment of the child, as punishment, intimidation, and yelling can reinforce negative behaviors, including stuttering.

4. Stuttering Anticipation Theory:

Wischner (1956) focused on studying one of the most prominent observations related to the modification of stuttering, known as the **anticipated effect**.

George Wischner developed his theory based on the following assumptions:

First: Stuttering behavior is reinforced due to its association with a relative decrease in tension and anxiety that accompanies the reduction of fear of speaking. He hypothesized that a word that evokes fear triggers a state of anticipation (anxiety), and the occurrence of stuttering on that word is reinforced due to the decrease in tension once the feared word is completed.

Second: The person who stutters displays different patterns of avoidance behaviors. These behaviors are often closely tied to specific words, meaning that the individual intentionally develops a broad vocabulary and, when encountering a feared word, substitutes it with an alternative word.

Third: The anticipation phenomenon in stuttering behavior implies the belief that the person who stutters possesses a mechanism that is built and reinforced not based on reduced anxiety and tension, but on confirming the accuracy of the anticipation. In this case, the mechanism is perceived in the imagination of the person who stutters as self-confirmation of the anticipated stutter.(Amin, 2017, p. 24)

Wischner indicated that a child, due to the negative and incorrect evaluation of their lack of fluency, begins to feel anxious about their speech. This anxiety ultimately becomes conditioned to a specific sound or word, the act of speaking, or specific speaking situations, leading to avoidance behaviors known as stuttering. The main issue in Wischner's theory is the difficulty in explaining how a parent's inappropriate reaction to a child's natural disfluency can trigger a chain of events that leads to anxiety and avoidance. (Kashif, 2010, p. 107)

Murray et al. (1987) were among those who emphasized the idea of anticipation as an important and influential factor in the onset of stuttering. He stated that the idea of stuttering itself leads to its occurrence, as the individual, when expecting speech difficulties, becomes anxious about speaking, which in turn results in stuttering—this is referred to as the vicious cycle. (Amin, 2017, p. 24)

Third: Environmental and Social Factors:

Environmental and social factors play an active role in causing a disruption in speech fluency. Conture (1982) believes that the environment in which children grow up, especially the internal and external family surroundings and the pressures a child is exposed to, affects their linguistic abilities. The researcher adds that the child's social and home environment, particularly the parents, do not cause stuttering themselves, but they contribute to its maintenance and development from its initial stages to the stage of real stuttering. (Amin, 2017, p. 27)

1. Diagnostic Error Theory:

This theory suggests that stuttering begins with the diagnosis made by parents, particularly the mother. Most children often experience disfluency during early stages of development, and the parents misdiagnose this normal disfluency as stuttering. The parents' anxiety reflects onto the child, who begins to focus on the way they speak

and starts avoiding talking out of fear of mockery or punishment. Here, normal disfluency becomes pathological stuttering due to the parents' hasty misdiagnosis. Thus, one might say that stuttering is born in the mother's ear, not in the child's mouth. (Al-Jarwani & Seddik, 2013, p. 76)

Johnson emphasizes that stuttering is an avoidant reaction characterized by anticipation, fear, and intense tension. He explains that the onset of stuttering in children arises from a misjudgment of normal disfluency. Almost all children stumble in speech occasionally, but parents who wrongly interpret these disfluencies as stuttering and show excessive concern about their child's speech may transmit this anxiety to the child. Once the child becomes aware of the parents' anxiety regarding their speech, they begin to feel anxious themselves and fear speaking situations—leading to stuttering. Emotional states, anxiety, and fear become associated with speaking situations and generalize to similar situations, becoming a chronic tendency and a habitual pattern in the child. (Amin, 2017, p. 22)

2.Demands and Capacities Theory – Starkweather (1987): According to the two researchers, stuttering occurs when the environmental demands exceed the child's fluency capacities. These capacities include motor, cognitive, and linguistic knowledge necessary for normal speech.(Rondal & Seron, 2003, p. 514)

3. Other Environmental Factors:

Morley adds that there are environmental and personal factors that may lead to stuttering, such as:

- **Sudden trauma:** Records of some individuals who stutter show a correlation between severe trauma or frightening experiences during childhood and the development of stuttering.

- **Speech awareness:** Self-awareness related to speech may trigger the onset of stuttering—for instance, being asked to tell a story in front of strangers or at a school event. Comments on the child's speech—whether praise or ridicule—can lead to excessive self-consciousness in some children, impairing their fluency.

- **Correction of expressive flaws:** Attempts by parents or others to correct the child's speech errors during language development can lead to feelings of frustration and constant fear of failure in speech.

- **Imitation:** A young child is rarely aware of verbal disfluency, so they may unconsciously imitate the stuttering of another child or a parent with speech disfluency, especially when there is a genetic predisposition. (Amin, 2017, p. 28)

Among the environmental factors within the family and school context, Al-Jarwani and Seddik (2013) mention the following:

- Parents rushing their children to speak during the early years without considering their limited speech abilities.

- The use of fear and physical punishment when the child exhibits any speech deviation.

- The child reverting after the age of four to infantile speech patterns, encouraged by the parents as a result of overindulgence.

- Neglect by the parents and the child's lack of affection, love, and parental care.

- Teaching the child multiple languages at the same time.

- The teaching methods used by the teacher, whether by avoiding calling on the child to spare them embarrassment or by interrupting them because of delayed responses due to stuttering.

- Academic failure, which can contribute to the development and reinforcement of stuttering. (Al-Jarwani & Seddik, 2013, p. 58)

Commentary on Theories Explaining Stuttering:

We have previously presented a comprehensive analysis of stuttering theories, where we reviewed a wide range of explanations that interpret the causes of stuttering from different angles, including organic, neurological, psychological, behavioral, genetic, and environmental factors.

Stuttering, then, is a disorder that affects the flow and fluency of speech. It is also known as a fluency disorder or verbal fluency disorder. It is easy to diagnose, especially since its symptoms are clear, but accurate diagnosis depends on the skills of the speech-language pathologist, as it includes several systematic steps aimed at measuring the quality of fluency in terms of repetitions, pauses, and time duration. The person who stutters typically shows repetitions, blocks, prolongations, and speech blocks that hinder the completion of speech effectively. These signs are accompanied by other physical symptoms that vary from person to person, such as eye blinking, tics, lip or facial tremors, head movements, arm movements, breathing irregularities, clenched fists, and facial redness.

Many scholars have attempted to explain stuttering using various theories. Some attributed it to biochemical factors, associating it with blood chemistry composition and considering it a type of convulsive disorder. Others attributed it to neurological factors related to the axon of the nerve cell, where a deficiency in myelin (the myelin sheath) leads to disruption in fluency. Another group showed that stuttering occurs in the absence of cerebral dominance, where fluent speakers are distinguished by dominance of one brain hemisphere over the other—a trait absent in people who stutter.

The same idea was further developed by researchers linking it to the dominant brain hemisphere, which determines hand dominance. They explained stuttering as a result of violating the brain's physiological nature—for example, forcing a left-handed child to use the right hand.

Another group viewed stuttering as an internal conflict, where the person who stutters becomes a victim of a struggle between the desire to speak and the desire to remain silent. The result is a sense of helplessness and fear about speaking, making fluent speech extremely difficult.

Some researchers believed stuttering results from anxiety and fear, which arises from parents' incorrect assessment of their child's fluency. They mistakenly interpret normal disfluency as stuttering and express excessive concern about their child's speech. This anxiety can be transferred to the child, resulting in a fluency disorder.

Other scholars linked stuttering to genetic factors, highlighting the role of family history, twin studies, and male gender, all of which increase the likelihood of stuttering. They also identified specific genes responsible for the disorder.

The behavioral theory highlights its role and relationship with stuttering by explaining it as a learned behavior. Negative behaviors can lead to the emergence of the disorder. On the other hand, the neurotic theory interprets stuttering as a suppression of certain oral needs due to not being fulfilled during early stages—i.e., the infant being weaned early and abruptly, which creates an unmet need for breast sucking. As a result, oral movements remain suppressed and re-emerge later in the form of a fluency disorder.

Stuttering is also linked to numerous environmental factors at home and school, such as reprimanding and mocking, parenting styles, imitation, correcting expressive defects by parents, bilingualism, sudden trauma, and forcing the child to use language beyond their capabilities.

Based on what has been previously discussed, it becomes clear that multiple factors contribute to stuttering. Many theories have tried to explain fluency disorders, and various researchers have presented their modern scientific perspectives. Although stuttering has multiple causes, it shares common diagnostic criteria through its clear and consistent symptoms.

This study presented a scientific review of the theoretical approaches explaining stuttering, showing that it is a multifactorial disorder that occurs as a result of a complex interaction between:

- **Organic factors** (genetic, neurological, biochemical)
- **Psychological factors** (anxiety, unconscious conflicts)
- **Environmental factors** (family stress, misdiagnosis)
- **Behavioral factors** (learning, imitation, conditioning)

Therefore, effective treatment requires a comprehensive understanding of these contributing factors and the theories explaining them.

Conclusion:

From what has been presented above, we conclude that stuttering is a disorder of speech fluency, characterized by repetitions, prolongations, pauses, and other accompanying symptoms. We understand in our conclusion that no single theory can fully explain all cases of stuttering, which highlights its complex nature. Instead, multiple theories complement one another, including: the biochemical theory, the neurological theory, the psycholinguistic theory, the cerebral dominance theory, the neurotic theory, the classical conditioning theory, the demands and capacities theory, the behavioral theory, the genetic theory, the anticipatory struggle theory, and finally, the environmental and social factors theory. All of these theories are used to develop various treatment approaches, and thus, a better understanding of the causes of stuttering is essential to provide more effective support for individuals affected by it.

In light of the explanatory theories of stuttering and the multiple influencing factors, the following recommendations can be made to improve diagnosis, treatment, and support for people who stutter:

- Conduct more longitudinal studies to understand the development of stuttering and its relationship to genetic and neurological factors.
- Strengthen research on the interaction between psychological and biological factors in the emergence of stuttering.
- Develop accurate diagnostic tools using modern technology for early detection of the disorder.
- Raise awareness among families and teachers about stuttering and how to manage it appropriately.
- Provide psychological, social, and educational support for individuals who stutter to ensure healthy development.

Keywords breastfeeding, exclusive breastfeeding, infant, women's employment, child-rearing.

Abstract

The rate of exclusive breastfeeding in Algeria is among the lowest in the world, having declined in recent years in parallel with the increase in women's employment in the country. This situation prompted us to question the impact of women's employment on the practice of exclusive breastfeeding. To address this issue, we conducted a field study at a hospital in Tiaret Province, involving 150 mothers of infants aged between 6 and 12 months. The findings revealed a relationship between women's employment and the practice of exclusive breastfeeding, as stay-at-home mothers were more likely to exclusively breastfeed their infants for six months.

Introduction

It has been scientifically and medically proven that breastfeeding is of great importance and provides significant benefits to the health of both the child and the nursing mother, whether physically, psychologically, or in terms of disease prevention. Breast milk offers complete and optimal nutrition for infants, as it strengthens their immune system and protects them from potentially fatal diseases such as diarrhea and pneumonia. Breastfeeding also reduces the likelihood of infants being exposed to unsafe food or water, thereby saving the lives of millions of children.

Research indicates that exclusive breastfeeding during the first six months, along with continued breastfeeding throughout the first year, can save the lives of 1.3 million children each year — more than 3,000 children every day. Furthermore, if breastfeeding is continued alongside appropriate complementary feeding until at least the age of two, an additional 500,000 children can be saved annually, which is equivalent to around 500 more children every day. Experts strongly advise against the use of breast milk substitutes during this period, particularly infant formula.

Infant formula, as we know it today, is an alternative to breast milk primarily made from cow's milk and consists of nutrients such as proteins, iron, sodium, and fats. Although it contains essential nutrients for infants, its protective properties against diseases remain far lower compared to breast milk. Moreover, the risks associated with its regular consumption by newborns are high. According to the World Health Organization (WHO) and UNICEF, breast milk substitutes pose serious risks to infant digestion, as they often cause fatal infections. Conditions such as diarrhea, colic, respiratory illnesses, diabetes, and even obesity are much more common among children who are not breastfed.

For this reason, the World Health Organization has emphasized regulating the marketing of breast milk substitutes in markets and advertisements through the adoption of the *International Code of Marketing of Breast-milk Substitutes*. This aims to increase breastfeeding rates, which is considered an essential requirement for ensuring adequate nutrition for every child.

1. Problem Statement:

The World Health Organization (WHO) and the United Nations International Children's Emergency Fund (UNICEF) have estimated that around ten million children die each year due to gastroenteritis and malnutrition resulting from the use of infant formula. Consequently, these international health organizations banned such advertisements and labeled the producers and exporters of infant formula as "child killers of the Third World." This is because the lives of these children could be saved simply by switching to breastfeeding and abandoning formula substitutes.

Algeria is among the countries suffering from low rates of exclusive breastfeeding during the first six months of a child's life. According to the Sixth Multiple Indicator Cluster Survey conducted in 2019, the rate was estimated at **28.7%** (Ministère de la santé et UNICEF, 2020, p. 48). Although this represents an improvement compared to 2005, when the rate was **6.9%** (Ministère de la santé et autres, 2006, p. 68), and **25.7%** in 2013 (Ministère de la santé et autres, 2015, p. 7), the figures remain low.

At the same time, the proportion of economically active women in Algeria has risen, increasing from **9.97%** in 1987 to **15%** in 1999, then **17%** in 2006, and reaching **19%** in 2015 (Office Nationale de Statistique, 2015, p. 3).

For this reason, our study seeks to highlight the importance of breastfeeding, particularly during the first six months of a child's life, and to explore the relationship between exclusive breastfeeding and maternal employment.

Thus, the key question is: **Does maternal employment contribute to the low practice of exclusive breastfeeding?**

2. Definition of Concepts:

2.1. Breastfeeding:

Breastfeeding is the process of feeding the newborn with the milk produced by the female breast through suckling. It is an innate process shared between humans and other mammals, continuing from birth until weaning (Mohamed, 1992, p. 180).

2.2. Exclusive Breastfeeding:

Exclusive breastfeeding means that the infant is fed solely on the mother's milk, without receiving any other liquidsno t even wate or solid foods, with the exception of oral rehydration solutions, or drops/syrups of vitamins, minerals, or medicines (World Health Organization, 2011, p. 2).

2.3. Working Woman:

A working woman is defined as a woman who practices a profession or occupation outside the home, dedicating several hours of her time in exchange for a wage.

3. Methodology Adopted in the Study

3.1. Method:

In this study, we relied on the descriptive-analytical method, as it is the most appropriate approach for our research topic. It can be defined as "one of the forms of organized scientific analysis and interpretation aimed at describing a specific phenomenon or problem and portraying it quantitatively, or by collecting standardized data and information about the phenomenon or problem, classifying it, analyzing it, and subjecting it to in-depth study" (Sami, 2000, p. 324). We collected data from the field, then processed, categorized, and analyzed it using simple and cross-tabulated statistical tables to determine the impact of independent variable indicators on the dependent variable indicators, namely exclusive breastfeeding.

3.2. Questionnaire:

We employed the questionnaire technique in our study, which consisted of 32 questions divided into three sections. The first section was dedicated to personal information about the respondent, the second section concerned information about her infant, and the third section included questions about whether or not she was employed.

3.3. Sample:

The selection of a specific type of sample is dictated by the nature of the study, its problem, and hypotheses. Accordingly, we needed to choose a sample of women of childbearing age [15–49 years] who had an infant between 6 and 12 months old. Since there was no sampling frame available (i.e., the total number of mothers with infants under 12 months was unknown), we opted for a purposive sample, which falls under non-probability sampling. Maurice Angers defines it as "a sample in which the research population is unknown, and therefore the degree of representativeness of the sample cannot be estimated" (Maurice, 1997, p. 229).

We conducted the study at the Public Hospital Institution of Ksar Chellala, specifically in the Pediatrics Department, where mothers stay with their children, and in the Preventive Medicine Department, where children are vaccinated, as mothers usually bring their infants for vaccination.

Our research population consisted of 150 women of childbearing age (15–49 years), all of whom had at least one infant aged between 6 and 12 months. We restricted the age of infants for two reasons: first, the infant had to be at least six months old since the focus of our study required it; second, we capped the age at 12 months to ensure that mothers could easily recall relevant details within the reference period. This made it easier for them to answer precise questions such as the date breastfeeding started, the date when foods other than breast milk were introduced, and the duration of exclusive breastfeeding.

The fieldwork lasted two and a half months and was divided into two phases. The first phase spanned from April 12, 2015, to July 2, 2015, during which we interviewed 27 women and completed 27 questionnaires. In the end, we obtained 150 questionnaires, at an average of two per day. Sometimes, we managed to interview up to five women per day who met the study criteria, while on other days, we found none. It is worth noting that the interviews and the completion of questionnaires were conducted by two nurses from the health sector who had been trained for this task, given a comprehensive overview of the research topic, and were accompanied throughout the fieldwork period.

4. Analysis of Study Results

Table 1: The Relationship Between the Mother's Professional Status and the Timing of Initiating Breastfeeding After Birth

Start of Breastfeeding Professional Status	Immediately After Birth		After 1 to 6 Hours		After 6 to 24 Hours		After 24 Hours		Total	
	K	%	K	%	K	%	K	%	K	%
Working	11	15.71	19	27.15	35	50.00	5	7.14	70	100
Not Working	33	41.25	17	21.25	23	28.75	7	8.75	80	100
Total	44	29.33	36	24.00	58	38.67	12	8.00	150	100

From the data presented in the table, it is evident that the general trend shows that the majority of respondents initiate breastfeeding between six and twenty-four hours after birth, at a rate of **38.67%**, compared to **8%** who begin breastfeeding after twenty-four hours of delivery.

When introducing the independent variable, namely maternal employment, we observe that half of the working mothers initiated breastfeeding only after six to twenty-four hours, compared to **28.75%** among non-working

mothers. Meanwhile, the majority of non-working mothers began breastfeeding immediately after delivery (**41.25%**), compared to only **15.71%** of working mothers who did so.

The initiation of breastfeeding after delivery is influenced by the mother's professional status, as revealed statistically. This can be explained by the fact that working mothers who genuinely wish to succeed in breastfeeding often face work as an obstacle, reducing their chances of initiating breastfeeding immediately after birth. Working mothers may also have already decided to introduce infant formula early, and therefore see no necessity to start breastfeeding immediately, leading to delays. In contrast, non-working mothers are more eager to ensure successful breastfeeding, as they have no professional commitments outside the home. Their awareness of being able to spend all their time with their child in the future, along with their strong desire to succeed in breastfeeding particularly exclusive breastfeeding during the first six months serves as a strong motivation to begin breastfeeding immediately after birth.

Table 2: The Relationship Between the Mother's Professional Status and the Duration of Exclusive Breastfeeding.

Duration of Exclusive Exclusivity Employment Status	0–1 month (K / %)		2–3 months (K / %)		4–5 months (K / %)		6 months (K / %)		Total (K / (%)	
	K	(%)	K	(%)	K	(%)	K	(%)	K	(%)
Working	3	4.3	45	64.3	6	8.6	16	22.9	70 /	100
Not working	14	17.5	29	36.3	10	12.5	27	33.8	80	100
Total	17	11.3	74	49.3	16	10.7	43	28.7	150	100

Through the statistical reading of the table, it appears that its general trend indicates that the majority of the surveyed women exclusively breastfed their children for a duration ranging from 2 to 3 months at a rate of 49.3%, compared to 10.7% of the surveyed women who exclusively breastfed their children for a duration ranging from 4 to 5 months.

When introducing the independent variable represented by the mother's employment status, it becomes clear that the majority of working mothers exclusively breastfed their children for a period of 2 to 3 months at a rate of 64.3%, compared to 4.3% who practiced the same pattern for a duration ranging from 0 to 1 month. Meanwhile, 36.3% of non-working women exclusively breastfed their children for two to three months, compared to 12.5% who practiced the same type of breastfeeding for 4 to 5 months. In general, we notice that there is a relationship between the two variables, which was confirmed through the calculation of the Chi-square test, where its value was estimated at 13.786, which is greater than the tabular Chi-square at the degree of freedom 3 and the significance level 0.05 estimated at 7.86. As for the degree of the relationship between the two variables, when calculating the contingency coefficient, it was estimated at 0.290, meaning that there is a somewhat weak relationship between the two variables.

It seems to us that the mother's employment does affect the practice of exclusive breastfeeding, and although the effect is somewhat weak as mentioned earlier, this weakness in the effect may be due to the influence of other factors, which prevents us from precisely determining the effect of the mother's employment status on the practice of exclusive breastfeeding. This is what we seek to determine by breaking down this variable into several other indicators in order to understand the real relationship between the two variables.

Table No. 3: The Relationship Between the Mother's Employment Status and the Type of Nutrition Provided to the Child During the First Six Months of Life,

	Exclusive Breast	Mixed	Breast feeding +	Mixed Feeding +	Total

Type of Nutrition Provided to the Child / Employment Status	feeding (K)		Feeding (K)		Other Food (K)		Other Food			
	K	(%)	K	(%)	K	(%)	K	(%)	K	(%)
Working	16	22.9	45	64.3	1	1.4	8	11.4	70	100
Not working	27	33.8	38	47.5	3	3.8	12	15.0	80	100
Total	43	28.7	83	55.3	4	2.7	20	13.3	150	100

surveyed women provided mixed feeding to their children during the six months following childbirth, at a rate of **55.3%**, compared to **2.7%** of the surveyed women who provided breastfeeding combined with other food during the same period.

When introducing the independent variable represented by the mother's employment status, it was found that the majority of working mothers provided mixed feeding to their child in the first six months of life at a rate of **64.3%**, compared to **1.4%** of them who provided breastfeeding combined with other food. Meanwhile, **47.5%** of housewives provided mixed feeding to their child, compared to **3.8%** of them who provided breastfeeding combined with other food.

This disparity in percentages can be explained by the changing social role of Algerian women as a result of the economic, social, and cultural transformations that society has experienced. Whereas women used to remain at home, caring for the upbringing of children and fulfilling the needs of the husband and the family within the framework of the social division of labor between the spouses, today, after attaining educational levels, women have entered the labor market alongside men and spend most of their time outside the home. This situation affects their performance and relationships within the household. This is clearly reflected in the results of this table concerning the rate of exclusive breastfeeding during the first six months. Although the rate is low among both categories, it is noticeably lower among working women.

Table No. 4: The Relationship Between the Nature of the Mother's Working Hours and the Duration of Exclusive Breastfeeding During the First Six Months.

Duration of Exclusive Breastfeeding / Nature of Working Hours	0–1 month		2–3 months		4–5 months		6 months		Total	
	K	(%)	K	(%)	K	(%)	K	(%)	K	(%)
Full-time	3	5.0	42	70.0	2	3.3	13	21.7	60	100
Part-time	–	–	3	30.0	4	40.0	3	30.0	10	100
Total	3	4.3	45	64.3	6	8.6	16	22.9	70	100

Through the statistical reading of the data in the previous table, it appears that its general trend indicates that the majority of working women practiced exclusive breastfeeding for a duration of two to three months at a rate of **64.3%**, compared to **4.3%** of them who practiced the same pattern of breastfeeding for a duration ranging from 0–1 month. When introducing the independent variable represented by the nature of working hours, a variation in percentages appears, as most of the surveyed women working full-time practiced exclusive breastfeeding for two to three months at a rate of **70%**, compared to **3.3%** of them who exclusively breastfed their children for four to five months. Meanwhile, the majority of women working part-time practiced exclusive breastfeeding for four to five months, while the remaining percentage was divided between exclusive breastfeeding for two to three months and for four to five months at a rate of **30%** for each duration.

Based on the data of the table and after calculating Chi-square (Khi²), its value was estimated at **16.338**, which is greater than the tabular Chi-square value at the degree of freedom **3** and the significance level **0.05**, estimated at **7.86**. As for the degree of the relationship, when calculating the contingency coefficient, it was estimated at **0.435**, which indicates a moderate relationship between the two variables.

The nature of the mother's working hours affects the breastfeeding process, as observed in the previous table, where surveyed women working part-time had a longer duration of exclusive breastfeeding. This is natural since the mother is closer to her child most of the time, and if she truly intends to succeed in the breastfeeding process, her part-time work does not constitute an obstacle, as she is absent from home for only a short period. She can compensate her child with a feeding upon returning home if she works in the morning, or she can breastfeed him before leaving for work if her part-time shift is in the evening. This situation, however, does not apply to women working full-time, as they are absent from home throughout the entire day, and thus they find themselves compelled to introduce formula milk or other foods to their child.

Table No. 5: The Relationship Between the Proximity of the Mother's Home to Her Workplace Allowing Her to Return at Midday and the Duration of Exclusive Breastfeeding During the First Six Months.

Duration of Exclusive Breastfeeding / Nature of Working Hours	0–1 month		2–3 months		4–5 months		6 months		Total	
	K	(%)	K	(%)	K	(%)	K	(%)	K	(%)
Can return home	-	-	2	10.5	5	26.3	12	63.2	19	100
Cannot return home	3	5.9	43	84.3	1	2.0	4	7.8	51	100
Total	3	4.3	45	64.3	6	8.6	16	22.9	70	100

Through the data of the previous table, it appears that the general trend shows that the majority of working women practiced exclusive breastfeeding for a duration of two to three months at a rate of **64.3%**, compared to **4.3%** of them who practiced the same pattern of breastfeeding for a duration ranging from 0–1 month. When introducing the independent variable represented by the proximity of the workplace to the home, allowing the mother to return to her child at midday, it appears that the majority of the surveyed women who stated that they could return to their children at midday exclusively breastfed their children for **6 months** at a rate of **63.2%**. On the other hand, most of the women who stated that they could not return to their children at midday practiced exclusive breastfeeding for only two to three months at a rate of **84.3%**, while **2%** of them practiced exclusive breastfeeding for four to five months. After calculating Chi-square (Khi²), its value was estimated at **40.952**, which is greater than the tabular Chi-square at the degree of freedom **3** and the significance level **0.05**, estimated at **7.86**. As for the strength of the relationship, when calculating the contingency coefficient, it was estimated at **0.608**, which indicates a strong relationship between the two variables.

The effect of the mother's employment on the practice of exclusive breastfeeding does not appear clearly, as employment is not necessarily an obstacle to breastfeeding. This was observed in the previous table, as the mother who seeks to succeed in breastfeeding, even if she is employed, will always strive for it whenever she has the opportunity and will make use of every available moment. This was the case among the surveyed women who could return to their children at midday, as two-thirds of them succeeded in practicing exclusive breastfeeding for six months, and more than a quarter practiced it for four to five months. This indicates an increase in the duration of exclusive breastfeeding compared to their counterparts who are absent from home throughout the day, most of whom introduce other foods to their children during the second or third month. Breastfeeding hours represent valuable giving if accompanied by other complementary conditions, such as the presence of nurseries near the home or close to the workplace, where the mother can breastfeed the child in the morning and evening, in addition to the morning feeding before leaving for work. In this way, she can make

good use of those two hours, and she does not have to introduce other food, thereby ensuring the continuity of exclusive breastfeeding until the sixth month.

Table No. 6: The Relationship Between the Duration of Maternity Leave and the Duration of Exclusive Breastfeeding During the First Six Months.

Duration of Exclusive Breastfeeding / Duration of Maternity Leave	0–1 month		2–3 months		4–5 months		6 months		Total	
	K	(%)	K	(%)	K	(%)	K	(%)	K	(%)
3 months	3	5.0	44	73.3	1	1.7	12	20.0	60	100
3–5 months	–	–	–	–	5	100.0	–	–	5	100
6 months or more	–	–	1	20.0	–	–	4	80.0	5	100
Total	3	4.3	45	64.3	6	8.6	16	22.9	70	100

It appears that the general trend of the table shows that the majority of working women practiced exclusive breastfeeding for a duration of two to three months at a rate of **64.3%**, compared to **4.3%** of them who practiced the same pattern of breastfeeding for a period ranging between 0–1 month. When introducing the independent variable represented by the duration of maternity leave, it is evident that **73.3%** of women who benefited from 03 months of maternity leave exclusively breastfed their children for two to three months, compared to **1.7%** of them who exclusively breastfed their children for 4 to 5 months. In contrast, all women who benefited from a duration of 03 to 05 months of maternity leave exclusively breastfed their children for 4 to 5 months, while we notice that most of those who benefited from a maternity leave of 06 months or more exclusively breastfed their children for 06 months, compared to **20%** of them who exclusively breastfed their children for two to three months.

We observe a relationship between the two variables, as evidenced by the Chi-square test, which when calculated was estimated at **70.34**, a value greater than the tabular Khi² at 6 degrees of freedom and a significance level of 0.05, estimated at **12.59**. As for the degree of association, when we calculated the contingency coefficient, it was estimated at **0.711**, indicating a strong relationship between the two variables.

Through this variable, represented by the duration of maternity leave, it becomes clearly evident that the mother's employment affects the practice of exclusive breastfeeding. Maternity leave is often limited to only three months, which leads to the introduction of formula milk and other foods to the child immediately, so that the mother can resume her work since her maternity leave limited to 3 months—has ended. This is despite the fact that the National Charter emphasized the necessity of taking into consideration the working conditions of women to enable them to balance between their household duties and their professional duties. It stated that: *"Women represent half of the population capable of working and constitute an important reserve of the labor force in the country. However, the integration of Algerian women into the circles of production must take into account their role as wives and homemakers in building and supporting the family, which constitutes the basic unit of the nation. Moreover, the employment of women must be surrounded by strict laws that preserve motherhood and ensure the security of the family."* (National Liberation Front Party, 1976, p. 168).

Conclusion and Summary:

Through our analysis of the tables, we concluded that stay-at-home mothers are the first to initiate breastfeeding after childbirth at a rate of **41.25%**, compared to only **15.7%** of working women who initiate breastfeeding immediately after delivery. This indicates that the more the mother stays at home, the earlier she begins breastfeeding her child immediately after birth.

We also concluded that the mother's employment does not directly affect the breastfeeding process if certain factors are available that prevent the influence of this variable. When this variable is introduced in general—by dividing it into two categories (mother works – mother does not work) the clear effect on the practice of exclusive breastfeeding only appears after breaking down the mother's work into the indicators we addressed in the analysis of the previous tables.

One of the most important indicators of the mother's work is her working hours. We found that mothers who work part-time or on a reduced schedule had longer durations of exclusive breastfeeding compared to their counterparts who work full-time.

The same result was reached when dividing working mothers according to the proximity of their workplace to their home or to the home of a relative, making it possible for them to return to the child and breastfeed during midday. The duration of exclusive breastfeeding was higher among those who could return to their children during the workday, as they made good use of breastfeeding hours in addition to the midday break. There was a significant difference in the rate of exclusive breastfeeding compared to those whose workplaces were far from their homes. Perhaps the most important indicator that had a significant impact on the practice of exclusive breastfeeding is the duration of maternity leave. We observed that the early introduction of formula milk and other foods to the child occurred immediately after the end of maternity leave so that the mother could resume work. On the other hand, the rate of exclusive breastfeeding for six months rose to **80%** among women who did not return to work until after six months or more had passed since childbirth.

From the above analysis, it can be said that the mother's employment significantly reduces the likelihood of the newborn receiving exclusive breastfeeding during the first six months of life. However, this effect may not occur if certain facilities are provided, such as the availability of nurseries in workplaces, strengthening existing laws regarding maternity leave and breastfeeding hours with additional legislation that guarantees children's rights to adequate breastfeeding without resorting to formula and other foods that cause more harm than benefit, and enabling the mother to exercise her natural biological role.

Keywords	bullying, bullying effects, interpretative approaches.

Abstract
Bullying, as a behavioral phenomenon, is as old as humanity itself, yet it continues to evolve in response to shifting cultural and societal norms. Despite its enduring presence across civilizations, academic inquiry into bullying began relatively recently in the 1970s. Today, bullying is recognized as a pervasive and deeply entrenched issue with the capacity to undermine the psychological and social stability of both individuals and communities, transcending barriers of race, religion, language, and social class. Its alarming prevalence in familial, educational, professional, and social settings has drawn the attention of governments, international organizations, media outlets, and scholars alike. This intensified focus reflects growing awareness of its profound psychological, social, and economic consequences—many of which persist well into adulthood. Against this backdrop, researchers have endeavored to analyze the phenomenon through various theoretical lenses, with interpretations shaped by distinct disciplinary, cultural, and epistemological paradigms. This paper examines the psychological and sociological approaches that underpin our understanding of bullying, delving into its conceptualization, manifestations, antecedents, and repercussions.

Introduction

Bullying, a behavior intricately tied to power dynamics and social structures, has been a constant in human societies. It emerges under specific conditions, reflecting an interplay of individual traits, environmental stimuli, and cultural norms. While its existence can be traced to ancient times, the systematic study of bullying remains a relatively modern endeavor. At its core, bullying encompasses acts of intentional aggression—whether

psychological, verbal, or physical—targeting individuals who are unable to adequately defend themselves. These acts are typically characterized by repetition and an inherent imbalance of power [1].

In recent decades, bullying has garnered significant scholarly and public attention due to its detrimental impact on mental health and social cohesion. It is widely understood as a complex phenomenon shaped by the interaction of individual dispositions and environmental influences, including familial dynamics, peer relationships, educational settings, and societal structures. The notion that human behavior is shaped by environmental contingencies is hardly novel. However, the intricate interdependence among these variables—particularly in bullying scenarios—underscores the need for an integrative approach. Such an approach elucidates the roles played by perpetrators, victims, and bystanders within broader social ecosystems [2].

Bullying does not occur in isolation. It reflects and reproduces the values, norms, and power relations embedded within its sociocultural context. Familial patterns, such as exposure to aggressive role models, can perpetuate bullying behavior. Similarly, school climates and peer networks can either reinforce or mitigate its occurrence, depending on the prevailing attitudes and interactions within these environments. At a macro level, cultural ideologies and societal values further shape how bullying is expressed and perceived [3].

1. Theoretical and Conceptual Definitions of Bullying

Bullying, as a term, has been subject to varied interpretations across languages and disciplines. A review of Dessoqi (2016) highlights the multiplicity of translations for the term, each capturing distinct nuances of the phenomenon. Common translations include:

- **Bullying**: Reflecting intentional aggression and dominance.
- **Harassment**: Emphasizing repetitive and unwanted behaviors.
- **Intimidation**: Denoting the use of fear to control or manipulate others.
- **Tyranny**: Highlighting systemic or hierarchical power imbalances.

1.1- Etymology of the Term Bully

The English term *bullying* has its roots in the word *bully*, which originally appeared in the 16th century as a term of endearment, meaning "sweetheart" or "lover," applicable to both genders. This early usage is derived from the Middle Dutch *boel*, meaning “lover” or “brother,” which itself may trace back to *broeder* (brother)[4] .

By the late 17th century, the meaning of *bully* shifted significantly, evolving into a term associated with aggression and dominance. During this period, it came to describe a “blusterer” or “harasser of the weak,” reflecting behaviors of intimidation and coercion. This semantic transition was further influenced by its application to those acting as “protectors of prostitutes,” a usage documented by the early 18th century [5].

The verb form, "to bully," emerged around 1710, meaning “to overbear with bluster or menaces,” solidifying the term’s modern association with aggressive and oppressive behaviors [6]. The transformation of *bully* over centuries underscores shifting societal perceptions of interpersonal power dynamics and behaviors linked to dominance.

1.2- Terminological Definition

In psychological and sociological discourse, *bullying* is conceptually defined as a deliberate and systematic pattern of aggression, characterized by repetition over time and a significant power imbalance between the aggressor and the victim. This behavior often involves physical, verbal, relational, or psychological harm, wherein the perpetrator seeks to assert dominance and control, while the victim typically lacks the resources or ability to retaliate effectively [7].

1.3- Conceptual Definition

Always Bullying, as a phenomenon, is characterized by intentional aggression perpetrated by an individual or group wielding greater power or dominance over a weaker or more vulnerable target. This deliberate

behavior often involves deriving pleasure from witnessing the victim's distress and inflicting physical, emotional, or psychological harm [1].

Melhem (2004) elaborates on this definition, describing bullying as an aggressive act aimed explicitly at causing harm to another, driven by the perpetrator's gratification in observing the victim's suffering.

Bullying manifests in multifaceted ways, encompassing physical, emotional, and verbal aggression, alongside social exclusion and intimidation. It may escalate into acts of extortion, threats of violence, and violations of personal or civil rights. In severe cases, bullying involves organized group aggression, sexual harassment, or even attempts to inflict life-threatening harm. Juvonen, Graham, and Schuster emphasize that bullying behavior arises from an imbalance of power, where the aggressor exerts control over the victim. This imbalance may be expressed through physical harm, verbal humiliation, or indirect forms of aggression such as ostracism, rumor-spreading, and social rejection [2].

Millor (1997) provides further insight, defining bullying as a sustained and targeted form of violence inflicted by an individual or group upon a person incapable of self-defense [3].

- From the various conceptualizations outlined above, bullying can be distilled into several defining features:
- Bullying is not accidental or impulsive; it is a calculated and purposeful act aimed at inflicting harm.
- It represents a specific subset of negative behavior, characterized by hostility and malice, most prevalent during childhood and adolescence.
- A hallmark of bullying is the unequal distribution of power, whether physical, social, or psychological, between the bully and the victim.
- Bullying may manifest verbally, physically, psychologically, or socially, reflecting the diverse strategies employed by aggressors to assert control.
- Victims typically do not provoke the aggression, highlighting the unilateral and unjustified nature of bullying.
- Victims often lack the means to counteract or neutralize the bully's dominance, further reinforcing the power imbalance.
- Bullies frequently derive satisfaction, empowerment, or even enjoyment from their ability to dominate or humiliate others.
- Bullying is marked by its persistence with repeated incidents over time [4].

2. Forms of Bullying

Bullying manifests in various forms, each distinguished by its mode of expression, impact, and visibility. Among these, physical bullying stands out as one of the most overt and easily recognizable types. It involves deliberate acts of aggression, such as hitting, kicking, shoving, tripping, or intentionally damaging the victim's personal belongings. The conspicuous nature of physical bullying often makes it more accessible to detection and intervention. However, its implications extend beyond the physical, leaving deep psychological imprints on the victim's sense of safety and self-worth.

In comparison, verbal bullying operates on a spectrum of direct and indirect behaviors, each with its unique dynamics. Direct verbal bullying involves face-to-face confrontations, where the perpetrator employs insults, mockery, belittlement, or offensive remarks aimed at publicly humiliating or emotionally wounding the victim. Such encounters are often characterized by their immediate and personal nature, amplifying the victim's feelings of distress and vulnerability.

[3] Al-Sufi, Osama, and Al-Maliki, Fatima. "Bullying in Children and Its Relationship with Parental Treatment Styles (Al-Tanammur 'Ind Al-Atfal wa 'Alaqatuhu bi Asalib Al-Mu'amala Al-Walidiya)." Journal of Educational and Psychological Research, No. 35, 2012, pp. 146–183.
[4] Dessoki, Majdy. The Bullying Behavior Management Scale (Miqyas Al-Ta'amul Ma'a -Suluk Al-Tanammur). Amman: Dar Jouna for Publishing and Distribution, 2016. P, 14.

Indirect verbal bullying, by contrast, is more covert and insidious, making it harder to identify and address. It encompasses actions such as spreading malicious rumors, posting disparaging comments about the victim in shared spaces, or socially ostracizing the individual through calculated gestures or expressions. Unlike its direct counterpart, indirect verbal bullying often operates anonymously or through group dynamics, which intensifies the victim's sense of isolation and powerlessness. The concealed nature of these actions not only complicates efforts to hold aggressors accountable but also exacerbates the emotional and psychological toll on the victim [1].

- **Physical Bullying**

Physical bullying entails direct physical aggression, such as hitting, kicking, shoving, tripping, or deliberate destruction of personal belongings. This form is characterized by its overt nature, making it relatively easier to detect compared to other types. While the immediate physical harm may range in severity, its psychological ramifications often extend far beyond the surface injuries, profoundly affecting the victim's sense of safety and agency. Notably, physical bullying is observed less frequently among females, suggesting gendered variations in its manifestation [2].

- **Verbal Bullying**

Verbal bullying is the most pervasive form, transcending age groups and educational settings. It encompasses a spectrum of behaviors, including insults, derogatory remarks, threats, and public humiliation. This form often targets social identities such as gender, race, religion, disability, or socioeconomic status, exploiting these vulnerabilities to demean the victim and undermine their self-worth. Verbal bullying's potency lies in its ability to inflict profound psychological harm while often leaving no visible trace, complicating its detection and mitigation. Additionally, its public nature amplifies the humiliation, creating a ripple effect within peer groups [3].

- **Relational or Social Bullying**

Relational bullying, also referred to as indirect aggression, manipulates social relationships to isolate or ostracize the victim. This form manifests through exclusion from groups, rumor-mongering, and intentional social sabotage. It reflects an assertion of dominance within hierarchical social structures, where the perpetrator wields relational power to marginalize the victim. The long-term effects of relational bullying often include social withdrawal, reduced self-esteem, and difficulty forming healthy relationships. Addressing this form requires early and consistent intervention to disrupt the patterns of social control that sustain it [4].

- **Sexual Bullying**

Sexual bullying involves unwanted sexual advances, inappropriate jokes, rumors, or coercive behaviors that target the victim's sexual identity or autonomy. This form of bullying not only infringes upon personal boundaries but also perpetuates gendered power imbalances and societal stigmas [5].

- **Emotional Bullying**

Emotional bullying, often termed psychological or moral bullying, targets the victim's emotional resilience and sense of self-worth. Behaviors include social exclusion, persistent ridicule, hostile nonverbal cues, and undermining the victim's confidence. This form is particularly insidious, as it frequently goes unnoticed by adults and authority figures. Emotional bullying erodes the victim's psychological well-being over time, leaving scars that are difficult to heal. Its subtlety and long-term impact make it one of the most destructive forms of bullying [6].

- **Racial Bullying**

Racial bullying is motivated by prejudice and discriminatory attitudes, targeting individuals or groups based on race, ethnicity, religion, or cultural background. It manifests through ridicule, stereotyping, exclusion, or even physical aggression. The compounded impact of racial bullying extends beyond personal harm to

[1] Abu Al-Diyar, Masad. The Psychology of Bullying: Between Theory and Practice (Sikulujiyyat Al-Tanamnur Bayn Al-Nazariyya wa Al-Tatbiq). Kuwait: Kuwait National Library, 2013.P, 57.
[2] Abu Al-Diyar, Masad. The Psychology of Bullying: Between Theory and Practice (Sikulujiyyat Al-Tanamnur Bayn Al-Nazariyya wa Al-Tatbiq). Kuwait: Kuwait National Library, 2013.P, 57.
[3] Ibid.P, 58.
[4] Ibid.
[5] Ibid. P, 59
[6] Ibid.

systemic marginalization, as victims often perceive their identity as being under attack. Research underscores the disproportionate vulnerability of racial minorities to this form of bullying, particularly in environments where systemic inequalities persist [1].

– **Cyberbullying**

Cyberbullying leverages digital technologies to inflict harm, exploiting the anonymity and pervasive reach of online platforms. It encompasses behaviors such as spreading defamatory content, issuing threats, and orchestrating targeted harassment campaigns. Particularly prevalent among adolescents, cyberbullying is associated with severe mental health outcomes, including heightened anxiety, depression, self-harm, substance abuse, and even suicidal ideation and suicide [2].

3. Participants in Bullying

Bullying, as a social and psychological phenomenon, unfolds within a multifaceted web of interactions involving distinct roles. They can be categorized as follows:

A. The Bullies

Bullies assert their dominance through deliberate acts of intimidation, threats, and harm, exploiting perceived power imbalances to control their targets. Their behavior, however, is not monolithic and can be categorized into two principal subtypes, each with distinct psychological underpinnings:

1. The Instigator (Provocative Bully)

Instigators are characterized by emotional dysregulation and a deep-seated need to project dominance. Their aggression is often premeditated, driven by internal insecurities that manifest as a compulsive need to subjugate others. Lacking empathy for their victims.

2. The Reactive Bully

Reactive bullies, by contrast, are impulsive and hypersensitive to perceived threats. They interpret benign social cues as provocations, misjudging the intentions of others and responding with disproportionate aggression. In their minds, their behavior is justified as self-defense or preemptive retaliation. This type of bully operates under cognitive distortions, such as the belief that projecting dominance is essential to preserving personal security or respect.

B. The Victims:

Victims of bullying are children whose perceived weaknesses or vulnerabilities render them susceptible to targeted aggression. Their characteristics often align with specific psychological and social markers, which position them as easy targets within hierarchical structures. These include:

- Limited social competence: Difficulty navigating peer dynamics and asserting themselves effectively.
- Physical or emotional vulnerability: Traits such as smaller stature, introversion, heightened anxiety, or impulsivity.
- Social isolation: A lack of popularity or meaningful peer connections, which exacerbates their exposure to bullying.
- Compliance and passivity: A tendency to acquiesce to the bully's demands, whether through material concessions or emotional submission, further reinforcing the power imbalance.

C. The Bystanders:

Bystanders, though ostensibly passive, occupy a critical role in the ecosystem of bullying. Their presence—and their inaction—can tacitly validate the bully's behavior, contributing to the normalization of aggression. The psychological profile of bystanders is marked by a complex interplay of emotions and internal conflicts:

- Guilt and moral conflict: A profound awareness of the injustice unfolding before them, coupled with a sense of failure for not intervening.
- Fear of retaliation: A pervasive anxiety that stepping in could make them the bully's next target.
- Cognitive dissonance: Confusion over moral obligations versus self-preservation, often leading to paralysis.

[1] Abu Al-Diyar, Masad. The Psychology of Bullying: Between Theory and Practice (Sikulujiyyat Al-Tanammur Bayn Al-Nazariyya wa Al-Tatbiq). Kuwait: Kuwait National Library, 2013.P, 60.

[2] Saleh, Ikram. Bullying Behavior in Children and Adolescents (Suluk Al-Tanammur 'Ind Al-Atfal wa Al-Murahiqin). Cairo: Dar Rawabit for Publishing and Information Technology, 2020.P, 16

- Rationalized inaction: A belief that avoidance is the safest course of action, rooted in a desire for personal security.

4. Factors Contributing to Bullying

Bullying arises from an interplay factors, summarized as follows:

4.1- Psychological Factors

Psychological dimensions play a pivotal role in shaping the dynamics of bullying, as they illuminate the internal drives and vulnerabilities of both perpetrators and victims. Among bullies, certain psychological characteristics fuel aggressive tendencies. These individuals often exhibit a profound need for self-affirmation, which they achieve by asserting dominance over others. Their behaviors are marked by a strong inclination toward control and coercion, a predisposition to view violence favorably, and a striking lack of empathy for their victims. These traits not only sustain bullying behavior but also embolden the bully to continue inflicting harm [(1)].

Equally significant are the psychological traits of the victims, which often render them particularly susceptible to ongoing bullying. Victims tend to exhibit patterns of withdrawal, submission, and conflict avoidance. They may shy away from confrontation, opting instead for behaviors such as crying or passive compliance, which inadvertently reinforce the bully's sense of control and perpetuate the cycle of aggression.

Self-concept and self-esteem are pivotal factors in the bullying dynamic. As Omori and Kirkham (2001) assert, diminished self-esteem can predispose individuals to occupy the roles of either bully or victim, depending on how this internal deficit manifests. Victims, in particular, often exhibit high levels of anxiety, emotional fragility, and an external locus of control. They perceive their circumstances as dictated by forces beyond their control, a cognitive distortion that fosters feelings of helplessness and passivity.

Muawiya Abu Ghazal (2009) highlights that student victims of bullying are often characterized by shy or fragile temperaments, elevated levels of stress, and a pervasive sense of inadequacy. These individuals are typically quiet, emotionally reactive to trivial stimuli, and exhibit an external locus of control, perceiving their lives as governed by external forces beyond their influence [(2)].

Seligman's concept of learned helplessness offers further insight into the psychological state of victims. This phenomenon occurs when individuals, repeatedly subjected to adverse situations they cannot escape or influence, develop a pervasive sense of powerlessness. Victims of bullying often exhibit this learned response, reacting to aggression with tears (particularly among younger children) or withdrawal, behaviors that inadvertently signal vulnerability to aggressors.

Qatami and Al-Sarayra (2009) highlight several defining psychological traits common among victims of bullying. These include:

- Social Reticence: A tendency to withdraw from peer interactions, which isolates them and increases their vulnerability.
- Emotional Sensitivity: Pronounced reactivity to minor provocations, which bullies exploit to escalate aggression.
- Externalized Attribution of Control: A belief that external forces, rather than personal agency, govern their experiences, further entrenching feelings of powerlessness.
- Depressive Symptoms: Persistent feelings of inadequacy, low self-worth, and sadness, which exacerbate their susceptibility to victimization.

These characteristics create a psychological profile that perpetuates a cycle of victimization, as their responses—whether crying, withdrawing, or acquiescing—reinforce the bully's perception of power and control [(3)].

4.2-Personal Factors

[1] Al-Qar'aan, Ahmed Khalil. Early Childhood: Characteristics, Problems, and Solutions (Al-Tufula Al-Mubakkira: Khasaisuha, Mushkilatuha, Hululuha). Amman: Dar Al-Israa for Publishing and Distribution, 2004.

[2] Abu Ghazal, Muawiya. "Bullying and Its Relationship with Feelings of Loneliness and Social Support (Al-Istaqwa' wa 'Alaqatuhu bi Al-Shu'ur bi Al-Wihda wa Al-Da'm Al-Ijtima'i)." Jordanian Journal of Social Sciences, Vol. 5, No. 2, 2009, pp. 89–113.

[3] Qatami, Naifa, and Al-Sarayra, Mona. The Bullying Child (Al-Tifl Al-Mutanammir). Amman: Dar Al-Maisara for Publishing and Distribution, 2009. P, 83.

Bullying behavior is often underpinned by diverse personal motivations, reflecting a spectrum of psychological and emotional dynamics. In some cases, it arises from impulsivity or thoughtlessness, manifesting as reckless actions without deliberate intent. For others, bullying may serve as a response to boredom, driven by a need for stimulation or excitement.

A significant contributing factor lies in the bully's lack of awareness regarding the harm inflicted by their actions. Perpetrators may fail to perceive their behavior as morally or socially unacceptable, rationalizing it as inconsequential or justified. This distorted perception can lead them to believe that their targets deserve such treatment, often reinforcing aggressive tendencies.

Furthermore, bullying may be symptomatic of deeper emotional distress. For some children, it reflects underlying anxiety or dissatisfaction within the family environment, while for others, it serves as a maladaptive coping mechanism to process their own experiences of victimization. Children who have previously endured bullying are more likely to adopt aggressive roles as a means of regaining a sense of power and control.

Victims' emotional and social vulnerabilities also play a critical role in perpetuating the cycle of bullying. Traits such as excessive shyness, poor social skills, and limited peer connections often position individuals as easy targets. A lack of meaningful friendships and emotional resilience can exacerbate their susceptibility, creating conditions that facilitate continued victimization [(1)].

4.3- Familial Factors

The family environment plays an instrumental role in shaping children's behavioral tendencies, particularly with regard to bullying. When aggressive behaviors in children are not met with effective and consistent non-physical disciplinary measures, such behaviors may be inadvertently reinforced. Additionally, children who witness bullying within the family—whether through observing parents or siblings engaging in aggression, or through familial victimization—are more likely to replicate similar patterns in their own interactions.

The use of punitive parenting methods, especially physical punishment, significantly contributes to the development of bullying behavior. Such practices instill a sense of dominance and control in children, leading them to associate aggression with power and self-worth. For these children, bullying becomes a means of asserting their presence and influence, often in response to feelings of insecurity or inadequacy [(2)](Mohamed, 2000, p. 37).

The role of the family in shaping a child's character is unparalleled, as encapsulated in the prophetic saying: *"No child is born except upon the natural disposition; it is his parents who make him a Jew, a Christian, or a Magian."* The parental approach to discipline and the overall familial atmosphere profoundly impacts the likelihood of bullying behaviors. Evidence suggests that both bullies and victims often emerge from family contexts marked by harsh discipline, neglect, or emotional detachment. Bullies frequently report an absence of parental warmth and emotional support, while victims often endure overprotection or excessive parental control, which undermines their autonomy and resilience.

Numerous researchers underscore the significance of parental modeling and supervision in either curbing or exacerbating bullying behavior. Exposure to aggressive role models within the home, coupled with weak parental oversight, dramatically increases the probability of children adopting bullying as a behavioral strategy. Households dominated by physical punishment, authoritarian control, or emotional abuse produce children who internalize aggression as an effective means of establishing dominance and ensuring their survival in social settings.

Hesham El-Khouly (2004) identified parental rejection as one of the most significant predictors of bullying behavior, particularly among high school students. Similarly, harsh disciplinary practices and parental rejection are strong predictors of bullying tendencies in middle school children [(3)].

4.4- Social Factors

[1] Al-Subhiyeen, Ali, and Al-Qudah, Mohammed. Bullying Behavior in Children and Adolescents (Suluk Al-Tanammur 'Ind Al-Atfal wa Al-Murahiqin). Riyadh: Naif Arab University for Security Sciences, 2013.

[2] Mohamed, Adel Abdullah. Behavioral Disorders in Children and Adolescents (Al-Idtirabat Al-Sulukiyya Ladā Al-Atfal wa Al-Murahiqin). Cairo: Dar Al-Rashad, 2000. P, 37.

[3] Dessoki, Majdy. The Bullying Behavior Management Scale (Miqyas Al-Ta'amul Ma'a -Suluk Al-Tanammur). Amman: Dar Jouna for Publishing and Distribution, 2016. P, 24.

Social factors represent a constellation of external influences that shape individual behavior, encompassing familial relationships, neighborhood dynamics, community interactions, peer group affiliations, media exposure, and the school environment. Within the familial context, parental treatment often oscillates between two extremes: excessive harshness, sometimes escalating to psychological terror, and overindulgence, where boundaries and discipline are virtually nonexistent. Violence within the family tends to perpetuate itself, creating a cyclical pattern that fosters aggression. Additional stressors, such as the absence of a father figure, domestic violence, maternal depression, and the psychological repercussions of parental divorce, can cultivate an environment ripe for the development of aggressive and bullying behaviors in children.

The interplay between home and school environments further compounds this issue. A culture of violence within the broader community frequently seeps into the school setting, normalizing aggressive behaviors among students. This phenomenon underscores the significant influence of three external components on students' socialization: family, community, and media [(1)].

Economic and social conditions exacerbate this dynamic. Factors such as low family income, parental illiteracy, psychological deprivation, and chronic frustration can render students vulnerable to maladaptive coping mechanisms, including bullying. These conditions often alienate students, fostering a sense of disconnection from their external environment and driving them toward aggressive behaviors as an outlet for their frustration and discontent.

Media serves as a powerful conduit for social influence, often reinforcing or perpetuating aggressive behaviors. Krousi (2005) highlights how media platforms, when exploited for commercial or personal gain without regard for their societal impact, contribute significantly to the normalization of violence and bullying. Television programs, films, and other media content—whether directed at children or adolescents—wield a profound influence over young viewers' social behaviors. By stimulating the imagination, such content often encourages identification with characters, particularly those involved in action, adventure, or violence. In some instances, this identification evolves into mimicry, as youth emulate the behaviors of these characters, reinforcing the cycle of aggression and dominance [(2)].

4.5- School Factors

The school environment plays a critical role in shaping student behavior and can either mitigate or exacerbate bullying tendencies. Key influences include the school's overall culture, its physical environment, peer relationships, the role of teachers, and the absence of specialized committees to address behavioral issues. When teachers resort to violence against students—irrespective of the form it takes—the effects extend far beyond temporary compliance. Such compliance is often superficial, masking deep-seated resentment that can spread among classmates and, over time, across the broader student body. This shared hostility may escalate into overt acts of bullying, particularly when unchecked.

Additional factors that contribute to bullying within the school context include inappropriate or provocative behavior by certain teachers, low academic performance among students, and the negative influence of peer groups. Psychological instability, weak connections between the school and students' families, unfavorable socioeconomic conditions, and the teacher's lack of authority or inadequate subject knowledge further compound the issue. Together, these elements create an environment ripe for the emergence and persistence of bullying behaviors [(3)].

4.6- Personal Factors of the Bully

A variety of personal and contextual factors can predispose children to adopt bullying behaviors. These include:

- Inadequate self-confidence and poor interpersonal skills hinder healthy social interactions.
- Emotional distress often manifests in aggressive behavior as a coping mechanism.
- Children who experience mistreatment at home may channel their anger into bullying weaker peers.

[1] Abu Ghazal, Muawiya. "Bullying and Its Relationship with Feelings of Loneliness and Social Support (Al-Istaqwa' wa 'Alaqatuhu bi Al-Shu'ur bi Al-Wihda wa Al-Da'm Al-Ijtima'i)." Jordanian Journal of Social Sciences, Vol. 5, No. 2, 2009, pp. 89–113.

[2] Al-Subhiyeen, Ali, and Al-Qudah, Mohammed. Bullying Behavior in Children and Adolescents (Suluk Al-Tanammur 'Ind Al-Atfal wa Al-Murahiqin). Riyadh: Naif Arab University for Security Sciences, 2013. P, 45.

[3] Ziad, Ahmed Rashid. Clinical Psychology ('Ilm Al-Nafs Al-'Iyadi). Amman: Al-Warraq for Publishing and Distribution, 2014. P, 123.

- A lack of guidance within the home environment deprives children of examples of appropriate behavior.
- Beliefs that harshness and rigidity are essential for achieving social status among peers.
- Deep-seated mistrust of others, coupled with a desire for retribution and self-aggrandizement.
- Emotional dysregulation often leads bullies to externalize their frustrations, blaming others for their mistakes.
- Observing peers engage in bullying without consequences reinforces aggressive actions as socially acceptable.
- Exposure to television programs that glorify negative role models can inspire children to emulate such characters.
- The absence of clear rules or supervision allows bullying behaviors to flourish. [1]

5. Bullying Through the Lens of Psychological and Sociological Theories: Interpretive Insights

The phenomenon of bullying has long captured the attention of psychologists and sociologists, who have sought to unpack its complexities through diverse theoretical lenses. Despite the shared objective of understanding aggression, interpretations of bullying vary widely, reflecting the distinct epistemological foundations of different schools of thought.

5.1- Psychoanalytic Theory

Psychoanalytic theory, as articulated by Sigmund Freud, offers a profound framework for understanding aggression and bullying. Freud's conceptualization of human psychology revolves around two primary instincts: the life instincts (Eros), which drive love, creativity, and construction, and the death instincts (Thanatos), which underpin destruction, aggression, and violent impulses. Bullying, from this perspective, emerges as an external expression of the death instinct, manifesting in an individual's destructive urges directed either inward toward the self or outward toward others.

Freud posited that children are born with inherent aggressive drives that are instinctual in nature. Aggression and bullying, therefore, are interpreted as natural extensions of these primal urges. Additionally, Freud linked such behaviors to stages of psychosexual development, suggesting that aggression is especially pronounced during the oral, anal, and phallic stages. It is within the phallic stage, dominated by the Oedipal complex, that bullying tendencies often become most evident. Psychoanalysts widely agree that unresolved conflicts during this stage significantly contribute to the emergence and consolidation of aggressive and bullying behaviors in children.

Freud emphasized the critical role of the superego (*über-ich*)—the component of the psyche responsible for regulating morality and ethical behavior. Children raised in environments lacking consistent moral guidance are prone to developing weak or dysfunctional superegos. This deficiency often results in an impaired sense of guilt and moral accountability, leading them to perceive deviant or aggressive actions, including bullying, as socially acceptable or even admirable. For such individuals, bullying becomes a means of asserting power, which they might equate with heroism.

Freud further explored how repressed emotions and unmet instinctual needs contribute to the formation of aggressive tendencies. When societal or familial structures suppress a child's innate drives, the resulting frustration is often displaced, manifesting as aggression. While some bullying behaviors are spontaneous expressions of the *id*, others arise as reactions to unmet needs, such as deprivation or rejection. Emotional bonds within the individual's environment, however, can act as buffers, redirecting aggressive impulses outward rather than inward.

Psychoanalytic theory also highlights symbolic displacement, wherein aggressive energy is projected onto a surrogate target. Freud likened this process to primitive rituals, such as piercing a wax effigy to symbolically harm an adversary. Similarly, individuals channel their aggression toward substitute victims, externalizing their inner turmoil in ways that may feel cathartic yet perpetuate harm [2].

5.2- Physiological Theory

[1] Dessoki, Majdy. The Bullying Behavior Management Scale (Miqyas Al-Ta'amul Ma'a -Suluk Al-Tanammur). Amman: Dar Jouna for Publishing and Distribution, 2016. P, 26.

[2] Saleh, Ikram. Bullying Behavior in Children and Adolescents (Suluk Al-Tanammur 'Ind Al-Atfal wa Al-Murahiqin). Cairo: Dar Rawabit for Publishing and Information Technology, 2020.pp. 39-40.

Advocates of the physiological perspective contend that bullying behavior is markedly more prevalent among individuals with neurological impairments, particularly those involving brain damage. Such impairments are believed to disrupt the neurological systems responsible for regulating aggression and impulse control.

Additionally, some researchers within this framework attribute bullying to hormonal influences, particularly elevated levels of testosterone. Empirical studies suggest a positive correlation between increased testosterone concentrations in the bloodstream and heightened tendencies toward aggressive behaviors [1].

5.3- Biological Theory

The biological perspective frames bullying as a behavior rooted in intrinsic physiological and neurological factors. Central to this theory is the role of the brain's frontal lobe, which governs emotional regulation and aggression. Research indicates that severing specific neural pathways in this region can diminish feelings of anger, tension, and predispositions toward violence, further highlighting its significance in controlling aggressive tendencies in children.

Beyond neural structures, biological theorists point to physical conditions such as fatigue, hunger, or the presence of physical pain as triggers for aggressive or bullying behaviors. These factors exacerbate emotional dysregulation, making individuals more prone to lash out.

Moreover, some researchers argue that aggression, including bullying and violent tendencies, is inherently instinctual. From this viewpoint, such behaviors are integral to an evolutionary survival mechanism, embedded within the biological makeup of humans. Aggression is perceived as a means to fulfill innate drives, particularly those related to possession, dominance, and the assertion of control [2].

5.4- Behavioral Theory

Behavioral theory posits that human behavior, including bullying, is shaped not by internal emotions or subjective experiences but by observable external actions governed by the principles of stimuli and responses. Within this framework, aggression is viewed as a learned behavior, acquired and reinforced through environmental interactions. Behavioral theorists emphasize that the entirety of human conduct, including aggressive tendencies, is shaped by external influences. Aggression becomes embedded in an individual's behavioral repertoire when reinforced by circumstances that reward such actions, particularly in contexts of frustration or unmet expectations [3].

In the specific context of bullying, the behavior tends to recur when positively reinforced. For example, if a child uses physical aggression, such as hitting, and successfully achieves their desired outcome—whether attention, compliance, or material gain—they are likely to replicate the behavior. In contrast, behaviors that do not receive reinforcement gradually fade, aligning with Thorndike's *Law of Effect*. This principle asserts that actions yielding satisfying or rewarding outcomes are more likely to be repeated, while those that do not are extinguished.

The reinforcement process plays a pivotal role in perpetuating bullying behavior. A bully often derives reinforcement from several sources, including peers who condone or encourage their actions and the reactions of their victims. For instance, in primary school settings, when a victim responds to bullying with visible signs of distress, such as crying, the bully experiences positive reinforcement, solidifying their perception of aggression as an effective strategy for achieving dominance or fulfilling their goals.

In rare instances, when a victim retaliates or defends themselves, the bully might experience negative reinforcement, which can discourage further aggressive actions. However, this scenario is uncommon. More frequently, the bully is emboldened by the implicit or explicit approval of peers, who often bolster the bully's self-perception of superiority. This external validation not only reinforces the aggressive behavior but also motivates the bully to construct additional scenarios where they can exert dominance over others. The

[1] Al-Subhiyeen, Ali, and Al-Qudah, Mohammed. Bullying Behavior in Children and Adolescents (Suluk Al-Tanammur 'Ind Al-Atfal wa Al-Murahiqin). Riyadh: Naif Arab University for Security Sciences, 2013. P, 50.

[2] Saleh, Ikram. Bullying Behavior in Children and Adolescents (Suluk Al-Tanammur 'Ind Al-Atfal wa Al-Murahiqin). Cairo: Dar Rawabit for Publishing and Information Technology, 2020.p, 40.

[3] Radwan, Samer. Mental Health (Al-Sihha Al-Nafsiyya). Amman: Dar Al-Maisara for Publishing, Distribution, and Printing, 2007.P, 277.

reinforcement of their actions, whether through social validation or the successful attainment of their goals, sustains the cycle of bullying and further ingrains the behavior into their social interactions [1].

5. Frustration-Aggression Theory

The frustration-aggression theory conceptualizes frustration as the psychological state experienced when an individual perceives an obstacle that prevents them from fulfilling their needs or achieving their goals, or when they anticipate the presence of such an obstacle in the future [2](Abu Saad, 2015, p. 253).

Prominent theorists such as Neal Miller, Robert Sears, John Dollard, and Clark L. Hull have extensively explored this paradigm, focusing on the social dimensions of human behavior. At its core, the theory posits that frustration acts as a stimulus that inherently provokes aggression as a natural response. The intensity and persistence of this aggression are directly proportional to the degree and recurrence of the frustration experienced. When individuals are obstructed from attaining vital goals, they are likely to experience heightened frustration. This frustration can manifest in direct aggression against the source of the impediment if the individual feels confident enough to confront it, or in indirect aggression if fear of retaliation inhibits direct confrontation.

The theory further argues that frustration generates an aggressive drive, which seeks resolution through actions aimed at causing harm. This drive diminishes progressively after the aggressive act is carried out, a process referred to as *catharsis* or emotional release. Frustration elicits feelings of anger and injustice, creating a psychological predisposition toward aggressive behavior.

This dynamic is particularly evident in early childhood interactions, where most conflicts among preschool-aged children arise from competition over possessions or toys. When their biological or emotional desires are unmet, children often experience frustration, which frequently translates into aggressive responses. These behaviors highlight the role of frustration in precipitating acts of aggression as a means of resolving the tension caused by unfulfilled needs [3].

5.6- Humanistic Theory

The humanistic theory emphasizes guiding individuals toward self-actualization, focusing on the fulfillment of their potential and personal growth. Within this framework, the emergence of bullying behaviors is linked to unmet fundamental needs during childhood or adolescence, including biological necessities such as food, water, and basic security. The deprivation of these essential needs often results in feelings of insecurity, leading to weakened connections with peer groups and a diminished sense of belonging. This lack of social integration can significantly lower self-esteem, which, in turn, may manifest in maladaptive behaviors such as aggression and bullying as a means of compensating for unmet emotional and psychological needs [4].

5.7- Social Cognitive Theory (Social Learning)

Social cognitive theory, often referred to as social learning theory, posits that bullying behaviors are acquired through observational learning. Children model aggressive behaviors displayed by significant figures in their lives, such as parents, teachers, peers, or even characters in media like television programs. The likelihood of engaging in such behaviors increases when opportunities to replicate them arise.

The theory further argues that the consequences of observed behaviors play a critical role in determining whether aggression will be repeated. If a child receives punishment for imitating aggressive acts, they are less likely to replicate such actions. Conversely, if the behavior is rewarded—either materially, socially, or through achieved dominance—the child is more inclined to repeat it.

This theoretical approach highlights the importance of prior experiences and the motivational impact of learned outcomes. Research robustly supports the role of imitation and modeling in the acquisition of

[1] Dessoki, Majdy. The Bullying Behavior Management Scale (Miqyas Al-Ta'amul Ma'a -Suluk Al-Tanammur). Amman: Dar Jouna for Publishing and Distribution, 2016. P, 32.
[2] Abu Saad, Ahmed. Mental Health: A New Perspective (Al-Sihha Al-Nafsiyya: Manzur Jadid). Amman: Dar Al-Maisara for Publishing and Distribution, 2015.
[3] Dessoki, Majdy. The Bullying Behavior Management Scale (Miqyas Al-Ta'amul Ma'a -Suluk Al-Tanammur). Amman: Dar Jouna for Publishing and Distribution, 2016. P, 34.
[4] Saleh, Ikram. Bullying Behavior in Children and Adolescents (Suluk Al-Tanammur 'Ind Al-Atfal wa Al-Murahiqin). Cairo: Dar Rawabit for Publishing and Information Technology, 2020.p, 44.

aggressive behaviors, demonstrating that children may exhibit bullying tendencies even in the absence of frustration or direct provocation [1](Al-Subhiyeen & Al-Qudah, 2013, p. 51).

5.8- Cognitive Theory

Cognitive theory emphasizes the distinct differences in thought processes and cognitive patterns between bullies and their victims. Bullies tend to perceive themselves as having control over their environments and often frame their behaviors in a self-centered manner. They frequently justify their aggressive actions by claiming that their victims "deserve" the treatment, effectively normalizing their bullying behavior.

Dodge and Coie (1987) suggest that cognitive distortions are central to the mindset of bullies. These distortions often lead bullies to misinterpret others' intentions, erroneously perceiving them as hostile. Such flawed perceptions result in a heightened propensity for aggression. Additionally, bullies often display immature cognitive development, favoring one-dimensional thinking and maintaining overly positive attitudes toward violence.

Bullying behaviors are also tied to deficiencies in cognitive functioning. These include:

- Impairments in information processing.
- Difficulty maintaining attention and focus.
- Poor academic performance and achievement.
- Lack of sustained task engagement.
- Inefficient utilization of learning capacities.
- Deficiencies in memory retrieval and feedback mechanisms.
- Challenges in mental organization and strategic planning.
- Absence of foundational study and learning skills [2].

5.9- Rational Emotive Theory

Rational emotive theory emphasizes addressing the irrational beliefs and misconceptions held by students that underpin their bullying behavior. It posits that such behaviors stem from deeply ingrained yet flawed convictions, which must be identified, challenged, and replaced with logical, rational alternatives. Counselors employing this approach guide students to recognize that their harmful actions toward others are driven by erroneous thought patterns. Furthermore, they aim to help students internalize the understanding that exerting control and dominance over others does not equate to genuine strength or power; rather, it fosters resentment and alienation among peers.

As part of the counseling process, a significant focus is placed on transforming negative self-talk—internal monologues and beliefs that reinforce aggressive behavior. For instance, thoughts like, *"I must be the strongest and dominate others," "If I don't hit others, they will hit me,"* or *"Hurt the weak so the strong will fear you,"* are systematically replaced with constructive alternatives, such as: *"I will gain respect and recognition by helping others and refraining from harm, making me a valued and admired individual."*

Students are encouraged to engage in reflective exercises that involve articulating their internal thoughts when confronted with situations that trigger the desire to bully. By voicing these thoughts, they become more aware of their underlying motivations and their responsibility for their actions. For example, a student might express, *"This student is smaller than I am, and I am stronger."* Counselors then work to dismantle such reasoning, emphasizing that logical and ethical frameworks do not condone stronger individuals overpowering weaker ones. They also highlight that strength is finite and relative, underscoring the futility of aggressive dominance as a sustainable approach to interpersonal interactions.

Counselors further challenge students to consider the irrationality of their beliefs, focusing on key principles such as:

- **Happiness**: A person's happiness is directly linked to their thoughts and actions. Rational, positive thinking fosters emotional well-being and a sense of security, while irrational thought patterns often result in psychological distress and dissatisfaction.

[1] Al-Subhiyeen, Ali, and Al-Qudah, Mohammed. Bullying Behavior in Children and Adolescents (Suluk Al-Tanammur 'Ind Al-Atfal wa Al-Murahiqin). Riyadh: Naif Arab University for Security Sciences, 2013. P, 51.

[2] Abu Al-Diyar, Masad. The Psychology of Bullying: Between Theory and Practice (Sikulujiyyat Al-Tanammur Bayn Al-Nazariyya wa Al-Tatbiq). Kuwait: Kuwait National Library, 2013. P,81.

- **Unhappiness and social rejection**: Negative thinking and internalized self-talk lead to poor behavior toward others, which in turn causes feelings of unhappiness and social isolation.

Corey (1996) asserts that rational emotive theory equips individuals with the skills and tools necessary to identify irrational thoughts and replace them with constructive, rational ones. This cognitive restructuring allows individuals to modify their emotional responses to challenging situations, fostering healthier interpersonal dynamics. [1].

6. **Psychological and Social Impacts**

The ramifications of bullying are profoundly serious, with the potential to escalate to life-threatening consequences. Qmoore, from the Anti-Bullying Center at Trinity College Dublin, highlights an expanding body of research demonstrating that psychologically healthy individuals—whether children or adults—who experience bullying are significantly more susceptible to developing stress-induced disorders. In severe cases, this vulnerability can culminate in suicidal ideation or attempts. Victims of bullying often bear emotional and psychological scars that endure throughout their lives, and in extreme instances, they may contemplate ending their lives as a form of rejecting societal norms, condemning perceived injustices, or expressing despair regarding their future. This form of psychological distress can result from social oppression, acute alienation, and the absence of adequate emotional support. Some individuals may even view suicide as a means of retaliating against both themselves and their environment. Alarming statistics reveal that in the United Kingdom alone, between 15 and 25 children die by suicide each year due to bullying.

In school environments, victims of bullying often endure chronic anxiety, sadness, and an overarching fear of their aggressors. Their thoughts are frequently consumed by anticipation of future encounters with bullies. Such students may also report physical symptoms resulting from direct assaults, such as hitting or kicking. Fear of repeated victimization drives many to avoid participating in school activities or frequenting spaces like playgrounds and restrooms, where they feel most vulnerable. This avoidance deprives them of valuable social and educational opportunities, leading to long-term developmental deficits. Even when present in the classroom, their ability to concentrate on academic tasks is compromised, with severe consequences for their overall educational outcomes. Over time, some victims may develop risk-taking tendencies or exhibit violent behaviors as maladaptive coping mechanisms.

Prolonged exposure to bullying exacerbates symptoms of anxiety and depression, significantly impairing victims' social relationships. Consequently, bullied individuals often withdraw from social interactions, exhibit uncooperative behavior, and struggle to form or maintain friendships. Their isolation is compounded by the avoidance of peers, who may stigmatize them, further amplifying their emotional pain, social rejection, and diminished self-worth. These factors contribute to a sense of exclusion and lower their perceived social standing, which may further impede their psychological and emotional recovery.

Academically, bullying has a pronounced negative impact on victims' performance. Frequent mockery and rejection—stemming from their inability to defend themselves against aggressors—often result in feelings of humiliation and resignation. Victims expend considerable mental energy worrying about how to avoid future incidents, leaving little capacity for academic focus or engagement. Their preoccupation with self-protection frequently leads to disengagement from educational activities, particularly among those already struggling academically [2].

Conclusion:

Bullying has emerged as a critical behavioral phenomenon, drawing increasing attention from scholars and practitioners over the past two decades. This intensified focus reflects the pervasive nature of bullying across various domains of life, underscoring its profound implications for both individuals and broader social structures. As a multifaceted issue, bullying manifests in diverse forms and degrees, shaped by historical, cultural, and societal contexts. Alarmingly, its impact has escalated in recent years, posing significant challenges to numerous communities worldwide.

[2] Saleh, Ikram. Bullying Behavior in Children and Adolescents (Suluk Al-Tanammur 'Ind Al-Atfal wa Al-Murahiqin). Cairo: Dar Rawabit for Publishing and Information Technology, 2020.pp, 20-21.

What amplifies the severity of this issue is its disproportionate prevalence among children and adolescents—demographics widely regarded as the bedrock of any society's progress and development. The rise in violent behaviors within these groups threatens not only their personal well-being but also the broader social fabric. This alarming trend has necessitated rigorous academic inquiry across various disciplines, despite the relatively recent emergence of systematic research on bullying.

Scholars from diverse fields, including psychology, sociology, and medicine, have undertaken the critical task of deciphering the underlying causes and mechanisms of bullying. While theoretical frameworks and cultural perspectives vary, these disciplines converge in their commitment to unraveling the phenomenon's psychological, social, and economic dimensions. Through comprehensive analysis, researchers have developed robust scientific approaches to elucidate the dynamics of bullying, evaluate its long-term repercussions, and propose evidence-based interventions.

The collective efforts of these academic endeavors have yielded valuable strategies for mitigating the prevalence and severity of bullying. By addressing its root causes, fostering preventive measures, and promoting practical solutions, societies can safeguard vulnerable populations while nurturing environments conducive to healthy interpersonal and social development. Such insights serve as a foundation for building resilient communities and ensuring sustainable progress in the face of this persistent challenge.

Keywords Material Capability, recreational sports, physical activity, South of Algeria

Abstract
This study aims to know the role that the available financial capabilities play in influencing the attitudes of individuals towards the exercise of sporting recreational physical activities, as the study sample included 370 individuals engaged in sports physical recreational activities in the state of Ghardaia were chosen in an intentional way, where they were distributed a questionnaire dedicated to measuring The degree of this effect is in trends, and the data were analyzed by iterations, percentages, weighted mean and standard deviation.

One of the most prominent results is that the available financial capabilities contributed to the desire of individuals to engage in recreational sports activities, through the availability of stadiums, halls and places for sports practice, in addition to the financial capabilities of individuals enabled them to purchase some sports equipment used in practice.

Introduction and study's statement of the problem:

Free time is increasing and multiplying in our world today, as a result of change in the living conditions and the control of machines and their compensation of human effort. With this increase, individuals find themselves in a very difficult struggle to fill their free time with what is beneficial and far from the consequences of its misuse, so many resort to practicing sports activities as a solution to this problem of emptiness. However, no two people disagree on what the conditions of this practice dictate regarding the importance of having a space that contains these individuals and provides them with the material capabilities that meet the purpose and achieve what is required behind this practice. Therefore, sports capabilities were an important requirement for practicing sports and a basic essence for it. Evidence of this is what most countries in the world seek by establishing multi-specialty sports facilities. This matter was not in vain, but rather came as a result of the existence of a scientific basis that pushes and directs those in charge of the work a driving force to advance the facility and sports capabilities in order to best achieve the purposes for which it was established. (Darwish, 1998).

Today, practicing sports is one of the important things that benefits the individual and society, so countries are keen to support and form positive attitudes among their citizens towards practicing sports activities, and allocate large budgets to promote sports with its various goals, including recreation.

Given the novelty of the topic and its previous consideration as an act of sports management, it did not receive sufficient attention related to research and study. It has become clear to us that there are few studies related to this topic, which, even if they are sometimes hinted at, are nothing more than an implicit framework under another title or are a branch of a specific study, which is what we found in the study "Aflin Nassif Makari" entitled "Study."An analysis of the youth care programs at Minya University in 1988, which aimed at determining the clarity of the objectives of the university's youth care programs, the suitability of the activity programs to the needs of university students, and the suitability of the financial capabilities of the existing activities. The method used in this study was the descriptive method using the survey method. The study sample amounted to 36 individuals from the activity committee pioneers, 645 male and female students practicing various sports activities, and 44 specialists implementing the activities The most important results of this study were the following:

-Current programs do not achieve the goals set for them.

- Focus on organizing competitions in the programs offered without paying attention to the activities of the broad student base. Youth care workers are not specialized in some of the activities they supervise.

-There is a shortage of material capabilities, facilities and tools. There are no multiple ways to implement activity programs and they are only announced to a small extent.

We also found another study by "Samir bin Muhammad Khalil Sayed" entitled "Study of the Impact of Sports Potential and Activities on the Attitudes of Taibah University Students", which aimed at studying the impact of sports potential and activities on the attitudes of Taibah University students. The study sample included (295) students, who were selected using the random, stratified method conducted on all colleges of Taibah University. A questionnaire was distributed to the sample dedicated to this matter, and the researcher relied in conducting his study on the descriptive survey approach. One of the most important findings of this study was that the university's sports facilities are neglected, there is no supervisor for every sports activity at the university, students want to practice sports activities with their friends due to the lack of places to practice sports activities, there is no health-related physical fitness due to the lack of practice of sports activities at the university, and schedules for organizing sports activities hinder students' participation in them.

Accordingly, these studies are close to or similar to our research in that they search for financial capabilities and their connection to practicing sports and the latter's influence on this practice. However, they differ from our research in the influence of these capabilities on the demand or trend towards practice, especially in leisure periods, and this is what we seek to find in the results of this research.

The availability of capabilities is one of the basic elements affecting the degree of demand for practicing sports because the presence of facilities, halls, playgrounds and sports equipment is indispensable. Recreational sports cannot fully achieve their goals without the availability of the necessary financial capabilities which reduces the

feeling of boredom among practitioners and the difficulty in achieving the goal of recreation. Hence, this research problem revolved around investigating the extent to which the available material capabilities affect individuals' attitudes towards practicing recreational sports and physical activity. Accordingly, we assumed the following:

Individuals' attitudes towards recreational physical activity are influenced by available financial capabilities.

Objectives of the study:

This study aims primarily to highlight the effectiveness and degree of influence of available financial capabilities on individuals' attitudes towards practicing sports activities in their free time by knowing the extent of their availability or the reality of their existence as a means used to practice recreation through physical sports activity, and then the extent of their influence on the desire or reluctance to practice sports in individuals' free time.

Importance of the study:

Practicing sports is of great importance to developed nations and societies. Given that sports activity, whatever its goal, is an open world for all segments of society, from children, youth, adults and the elderly, whether male or female. It works to build society by taking care of the the individual's health and his entity, providing him with motor skills and physical fitness and accustoming him to the correct methods of dealing and refining behavior. (Malki Muhammad, Al-Hadi Issa, 2019, p. 344)

Practicing sports activities in leisure time is a civilized and educational aspect that benefits the individual and society with advancement and progress. Therefore, the Recreation and Leisure Charter affirmed the right of every person to participate in all forms of recreation and to integrate into them during leisure time. Therefore, countries have sought to find all ways to penetrate recreation into society by providing spaces and places for practice. In doing so, it hopes to spread the practice of recreational sports and find positive solutions to the problem of leisure time by finding the largest number of individuals practicing these activities, seeking to support their positive attitudes towards this practice. Accordingly, this study came to give a picture of what the availability of financial capabilities contribute to promoting and supporting attitudes towards practicing recreational sports activities. Studies have confirmed that the lack of financial capabilities hinders positive investment in free time and does not contribute to achieving happiness and quality of life in light of the ambition to create a civilized and modern society. Therefore, those concerned must overcome all difficulties and obstacles as much as possible in order to ensure positive participation in sports recreation activities, the most important of which is providing financial capabilities. (Bin Zaidan Muhammad, 2015, p. 93)

Keywords in the study:

Capabilities:

Terminological definition: It is everything that can contribute to achieving a specific current or future goal, including facilities, stadiums, devices, tools, budget, geographical conditions, information, and specialized cadres, following the scientific method of planning, management, evaluation, and achieving those goals. (Al-Shabkshi, 1990).

Procedural definition : It is a set of means, tools, conditions, people, and everything that facilitates and enables the practice of sports activities in society.

Direction:

Terminological definition: It is a state of mental and nervous excellence that is regulated by experience and imposes a dynamic effect, directing the individual's responses to various situations and stimuli. In his opinion, mental nervous preparation may be temporary and result from the momentary interaction between the individual

and the elements of the environment in which he lives, while long-term preparation is characterized by stability and constancy (Alawi Muhammad Hassan, 1992, p. 219).

Saad Abdel Rahman defined it as a willingness on the part of the individual to respond to a topic in a certain way (Abdel Rahman Saeed, 1971, p. 518).

Procedural definition: In our study, trend means the sum of an individual's tendencies and aptitudes that make him choose sports activity as a better alternative to many activities that fill his free time.

Recreational sports physical activity:

Terminological definition: Recreational sports physical activity is a type of activity that is practiced in free time and which the individual chooses out of personal motivation to practice, and which results in him acquiring many physical, moral, social and cognitive values (Al-Darwish Kamal and Al-Hamami Muhammad, 1985, p. 54).

Procedural definition: It is an activity that an individual or group can do in their free time, chosen according to their inclinations and desires, in order to achieve balance, or relax, bring joy, vent the human soul, renew its energy and activity. It is used to eliminate psychological disorders and social pressures (Bakhoush Hamida and Bouras Muhammad, 2020, p. 455).

Practical part:

1- Methodological methods used:

The approach followed: We followed the descriptive analytical approach due to its suitability to the nature of the study, which considers every investigation to focus on studying the phenomenon...As it exists in present, with the aim of diagnosing it, revealing its aspects, and determining the relationships between its elements...(Bin Mursali Ahmed, 2005, p. 287).

Spatial frame of the study: This study was conducted in the municipalities of the state of Ghardaia.

Temporal frame of the study

This study ran from October 10, 2018 until May 20, 2019.

Population and sample of the study:

Study population: The study population represents a group of individuals practicing recreational physical activities located in the state of Ghardaia.

Sample: The sample represents a part of the study population from which field data are collected and is considered part of the whole, meaning that a group of population members is taken to be representative of the research population (Zarwati Rashid, 2007, p. 334).

The study sample consisted of 370 individuals from a group of people practicing various recreational physical activities in the state of Ghardaia in southern Algeria, where they were selected intentionally.

Tool of the study: In this research, we used the questionnaire form technique as a data collection tool, which is sometimes called the survey form or case study. The questionnaire is defined as a set of questions composed in a systematic manner on a specific topic, then placed in a form sent to the concerned persons in order to obtain the answers contained therein (Alawi Muhammad Hassan and Ratib Osama Kamel, 1999, p. 146).

In this research, we used the questionnaire form technique, which we perceive as the most appropriate tool for our study after reviewing some of the tools used in previous studies, to be presented to the judges in order to get their final form.

Psychometric properties of the instrument:

- Questionnaire validity test: In the validity test, we adopted the following:

First: apparent honesty : To test the validity of the tool, we relied on apparent validity, as we presented the study tool (form) in its initial form to a group of expert doctors and specialists with knowledge, experience and expertise. The form phrases consisted of 25 phrases in their initial form. The judges were asked to express an opinion on the clarity of these phrases and their suitability for measuring what they were designed for and the adequacy of the phrases and their coverage of the various basic aspects of the study. In light of the guidelines provided by the judges, amendments were made, agreed upon by more than three-quarters of the judges, to the study tool, whether by amending the wording or deleting some phrases after identifying the topics of confusion and deficiency, and adding new phrases, as the form reached its final form, the topic under investigation.

Second: The validity of the internal consistency of the form

The validity of the internal consistency was verified after confirming the apparent validity of the form by applying it to a survey sample consisting of (50) individuals. The Pearson correlation coefficient was calculated between the scores of each axis of the form and the total score of the form. The correlation coefficient between each paragraph and its total score was also calculated using the statistical package (0SPSS.2).

We found that the values of the correlation coefficients for all paragraphs ranged between (0.558 and 0.747), as the correlation coefficient was average to strong between each paragraph of the field and its total score, which was estimated at: (0.889), in addition to the fact that all paragraphs proved their significance at the significance level (0.05). The following table shows the validity of the content of the axis statements and the total axis as a whole:

Phrase number	Phrases	Correlation coefficient	Significance
01	My financial capabilities allow me to purchase some tools and clothing to use for recreational sports activities	0,560**	Sign
02	Sports equipment and devices intended for recreational sports are suitable for use	0,634**	Sign
03	I use a balanced diet that enables me to exercise normally	0,558**	Sign
04	The availability of sufficient playgrounds, halls and sports practice areas has helped in the desire to practice sports in free time	0,673**	Sign
05	There are specialized sports facilities that encourage the practice of the preferred type of sport in leisure time	0,646**	Sign
06	The availability of adequate health facilities makes me feel safe exercising in my free time	0,641**	Sign
07	The amounts of subscriptions and membership in neighborhood teams and clubs are within the reach of the majority of people	0,655**	Sign

08	Health requirements for sports facilities are available	0,747**	Sign
09	The capabilities available to serve sports have contributed to individuals' interest and guidance towards practicing sports	0,658**	Sign
10	Sportswear and sports equipment are sufficiently available in stores and sales centers.	0,613**	Sign
11	Means of transportation and ease of movement to stadiums and sports halls motivate me to practice	0,581**	Sign

** Statistically significant at the significance level ($0.01 \geq \alpha$)

* Statistically significant at the significance level ($0.05 \geq \alpha$)

(Source: Based on the outputs of the 20.00 SPSS system)

- Stability of the questionnaire: We followed two methods in calculating stability

1- Questionnaire stability using Cronbach's alpha coefficient Alhpa

The stability coefficient of the study tool was calculated using Cronbach's alpha coefficient, Alhpa, on a sample consisting of (50) individuals and the ratio of the alpha coefficient was equal to.8520. This value is considered high, which indicates that stability is high, and thus the statements are valid for application.

2- Retest method: On a group of 50 individuals with a time interval of 15 days between the first and second application. When calculating the correlation coefficient, its value was r = 0.87, which is a statistically significant value at the significance level of 0.05.

Study procedures: We applied the study to a group of individuals through the following steps:

- Go directly to physical practice areas in neighborhoods and sports vehicles to meet the target group in the study.

- Distributing the questionnaire after that, as the number of questionnaires distributed was 370, of which we were able to retrieve 307 of them with complete data.

Organizing and transcribing questionnaires using a computer to subject them to statistical processing.

- Tools and statistical means: In processing the data of the questionnaires taken for the study, we used the Social Sciences Statistical Package Program "SPSS" 20.00, through which we used:

Standard deviation is considered a measure of dispersion, and it is the square root of the average squares of deviations from the mean.

Weighted average: The weighted mean is mostly used in five-step gradation measures for answers, and it was calculated according to the three-step gradation measure by giving a coefficient of 03 for a completely agree answer, 02 for somewhat agree, and 01 for a disagree answer, then collecting the results and dividing them by the number of sample members n.

-Repeats and percentages to describe the characteristics of the study sample and determine the responses of the study sample members, where:

$$m(\%) = K \times 100 / N$$

Where: K is the number of repetitions and N is the total

Pearson correlation coefficient to determine the validity coefficient of the study tool

Alpha coefficient to calculate the stability of the study tool.

2- Presenting, interpreting and discussing the results: The following table shows the descriptive data of the study sample on the contribution of financial capabilities to individuals' interest and orientation towards exercising in their free time.

Phrase Number	I completely agree		I agree some extent		I disagree		Weighted average	Standard deviation	Order
	Frequency	Percentage	Frequency	Percentage	Frequency	Percentage

Total average axis	2.42								

(Source: Based on SPSS 20.00 output)

Analysis and discussion:

The table above presents the descriptive data which are used to show the extent of contribution of material capabilities in directing individuals towards practicing recreational physical sports activities in the state of Ghardaia, where the arithmetic averages ranged between (2.52, 2.21), while the frequency and percentages of the study

sample ranged between the highest frequency of (228) at a rate of (61.6%) and the lowest frequency equal to (31) at a rate of (8.4%). The highest order of phrases was in phrase N (11) in the first order of phrases, the lowest order was in phrase N (8) as the last order, and the general arithmetic average of the axis was (2.42).

After reviewing the metadata through the table (arithmetic mean, ratios and frequencies), the results of the statements indicated the following:

1- The phrase that ranked first states: "Transportation and ease of movement to stadiums and sports halls motivate me to practice." Through this phrase, it became clear that the majority of individuals do not find a problem in moving towards their sports recreation places, and on this basis they accept to practice sports without difficulty.

2- The phrase that came in second place states: "I use a balanced diet that enables me to exercise normally." In its meaning, it is a translation of the financial situation of individuals, as most of them are helped by their financial capabilities to improve their dietary pattern in a way that makes it balanced and helps them exercise normally.

3- The phrase that ranked third states: "My financial capabilities allow me to buy some tools and clothes for recreational sports activities." The response of the majority of individuals indicated that their financial capabilities allow them to buy the tools and clothes they need, and therefore this encourages them to move towards exercising in their free time.

4- The phrase that ranked fourth stated: "The availability of stadiums, sports halls, and sports practice places is sufficient to help me turn to exercising in my free time", an answer indicating the importance and role of financial capabilities in directing individuals towards exercising.

The phrase that ranked fifth stated the following: "The availability of health facilities is sufficient to make me feel safe from exercising in my free time." A large percentage of individuals expressed their feeling of safety as a result of the availability of health facilities, especially neighboring ones, which would make individuals accept to exercise in their free time and they are reassured that these health facilities are by their side.

6- The phrase that ranked sixth reads as follows: "Sportswear and sports equipment are sufficiently available in stores and sales centers," in response to the majority of individuals that the presence of sportswear and sports equipment is sufficient in stores and sales centers, which encourages the desire to practice sports in general.

7- The phrase that ranked seventh stated the following: "Sports tools and equipment designated for practicing sports recreation are suitable for use." The study sample answered by a majority that sports tools and equipment are somewhat suitable for many considerations, the most important of which is the modernity of the halls and places designated for practicing sports, and this is an important matter and contributes to the interest and trend of individuals towards practicing sports in their free time.

8- The phrase that ranked eighth states: "There are specialized sports facilities that encourage in practising sports in leisure time." A large group of individuals responded somewhat in agreement with this, considering that there are specialized sports facilities that encourage the practice of sports in leisure time, and this is what makes them accept it, each according to his type of favorite sport However, the problem remains that these facilities are insufficient for all practicing individuals, forcing them to wait for their roles in benefiting from the latter, which sometimes makes the matter a cause of disagreement, boredom, or reluctance.

9- The phrase that ranked ninth is: "The financial capabilities harnessed to serve sports contributed to individuals' interest and directing them towards practicing it." Here, the majority of individuals expressed that these financial capabilities played a prominent role in individuals' interest in practicing sports, even if they were small at times or not available in all types of sports However, the undeniable reality is that the role of these available capabilities has contributed to individuals' interest in and orientation towards exercising in their free time.

10- The phrase that ranked tenth states: "The amounts of subscriptions and participation in neighborhood teams and clubs are within the reach of the majority of people." The individuals' responses indicated that the financial

subscriptions to neighborhood teams and clubs that provide a recreational sports space in general are within the reach of the majority of participating individuals, and thus justify the importance of the individual's special capabilities in attending and participating in his favorite recreational sports activities.

11- The phrase that ranked eleventh states the following: "Health conditions in sports facilities are available." This phrase is the one that ranked last in the axis phrases, and in its meaning it shows the difference in points of view between individuals on this issue between complete acceptance, acceptance to some extent, and rejection, and the significance and justifications for each of them Perhaps the matter is due to the difference in the places of activities for individuals and the condition of each place. As previously mentioned, the state's efforts in building sports halls and neighborhood stadiums, and the importance of that and even the fact that they are new at first, the issue that should be mentioned, which concerns the health conditions of these facilities, is that the floors of these stadiums are either cement, which makes falling into them a danger to the health of the individual Or earthen, where there is an increase in dust and dirt, which poses risks to the respiratory system, to the individual's health in particular, and to the surrounding environment in general.

Conclusion and suggestions: We conclude from the answers and opinions of the study members about the extent to which financial capabilities contribute to individuals' desire and orientation towards practicing sports in their free time that there is a focus on the answers and their lack of dispersion through the previous statistical indications, which express in their entirety the importance of the latter in pushing and directing members of society towards exploiting their free time in practicing sports in a way that benefits the individual and society. We also conclude from the above analysis that the available capabilities have contributed greatly to individuals' desire to practice sports in their free time, especially in terms of ease of movement to stadiums and sports halls and the presence of these places to a degree through which individuals can participate in their favorite activities. The availability of capabilities is one of the basic elements affecting the success of the recreational event, as the presence of halls, stadiums and sports equipment is indispensable Recreation cannot take place in the absence of these capabilities, because they are one of the most influential factors, especially in developing various cultural aspects of sports, which increases the feeling of belonging to the homeland. The presence of capabilities, especially devices and tools, reduces the feeling of boredom among practitioners, and limits unwanted behavioral manifestations that conflict with moral values, customs and social traditions in the homeland.

Therefore, we believe that it is necessary to increase attention to sports facilities and installations and provide the necessary sanitary means, especially in terms of stadium floors, which are mostly made of cement or dirt. The amounts of club subscriptions must also be reconsidered, especially clubs such as swimming and combat sports, which cost sums to join that burden the participants and thus keep them away from practicing their favorite activities in their free time. Thus, we arrive at the conclusion that whenever material capabilities are available, the trend moves in its direct direction towards positivity and the trend is opposite if they are not available. These results are consistent with the of study (Makari 1988) and the study of (Khalil Sayed, 2009).

Keywords Erosion of family, deviant behaviour, youth deviance, sociologiocal condition.

Abstract

The family constitutes the fundamental institution of primary socialization, shaping individual values, behavioral orientations, and cultural frameworks that guide subsequent integration into society. However, rapid economic, social, and cultural transformations have progressively eroded the family's educational and normative functions. This erosion has generated visible repercussions in the form of youth deviance, manifested in diminished self-discipline, normative disintegration, and the proliferation of deviant behaviors. The issue is particularly acute in the Arab world, and in Algeria specifically, where structural challenges—including family disintegration, economic hardship, technological intrusion, and weakened parental authority—exacerbate vulnerability among young people. This article provides an analytical sociological perspective on the nexus between the weakening of the family and the rise of youth deviance. Through a theoretical and contextual exploration, it highlights the interactive variables driving this phenomenon and proposes pragmatic measures to mitigate its societal impact. The family has historically functioned as the cornerstone of social cohesion and stability. It is the first institution where individuals acquire values, norms, and roles essential for societal integration. Yet, globalization, technological change, and socioeconomic pressures have undermined this pivotal role. In many societies, particularly within the Arab region, the weakening of family structures has coincided with a marked rise in deviant behaviors among youth. Algeria offers a critical case study in which traditional family bonds are increasingly challenged by economic instability, rapid cultural shifts, and new modes of socialization outside parental control.

Introdcution and Theoretical Framework

The analysis of family erosion and youth deviance can be grounded in classical and contemporary sociological theories.

- **Durkheim's theory of anomie** underscores the weakening of social norms when traditional institutions, such as the family, lose their regulatory capacity.
- **Social control theory** (Hirschi, 1969) highlights the importance of strong familial bonds in preventing deviance.
- **Cultural transmission theories** emphasize how the family serves as the primary agent of normative reproduction, whose weakening disrupts intergenerational continuity.

By applying these frameworks, one can conceptualize the family's retreat as a central factor in shaping youth attitudes toward conformity and deviance.

3. The Algerian Context

In Algeria, several interrelated factors exacerbate family erosion and its repercussions for youth:

1. **Economic pressures** – Rising unemployment, inflation, and precarious living conditions strain household stability, diminishing the family's ability to provide consistent supervision.
2. **Technological influences** – The pervasive impact of social media and digital technologies exposes youth to alternative value systems, often conflicting with traditional norms.
3. **Parental disintegration** – Divorce rates and the absence of effective parental exemplarity weaken the family's authority and normative influence.
4. **Cultural transitions** – The tension between traditional values and modern aspirations has contributed to normative fragmentation and identity crises among Algerian youth.

These dynamics collectively create fertile ground for the emergence and normalization of deviant practices, ranging from delinquency to substance abuse.

Discussion

The erosion of the family's role has both immediate and long-term consequences. In the short term, reduced supervision and weakened parental authority correlate strongly with juvenile delinquency and antisocial behavior. In the long term, the fragmentation of familial norms undermines social cohesion, perpetuating cycles of marginalization and deviance.

Policy interventions must therefore adopt a multidimensional approach, reinforcing both familial structures and complementary institutions (schools, community organizations, and media platforms). Programs supporting parental guidance, economic empowerment, and digital literacy are crucial to counterbalance the pressures facing families and reduce youth susceptibility to deviant trajectories.

The family constitutes the first social institution within which the individual is nurtured, inaugurating the earliest phases of socialization that lay the rudimentary foundations for personality formation, value acquisition, identity consolidation, and the construction of cultural as well as social belonging. Within the family, the child acquires initial communicative competences, masters elementary principles of social interaction, and becomes acquainted with the predominant value-normative complex. Sociological paradigms—from functionalism to symbolic interactionism—concur in foregrounding the family's centrality in role allocation and behavioral regulation, positioning it as the primary mediating structure between individual and society.

Over the past few decades, family life in Algeria has been buffeted by a chain of structural shifts. To begin with, escalating living costs and the rising necessity for dual earners have, quite literally, pulled parents out of the home for longer stretches. Hence, both the *symbolic* and the *practical* dimensions of parental oversight have thinned. At the same time, cultural currents—most notably a sharper taste for individual autonomy and the slow crumbling of extended-kin routines—have nibbled away at the household's moral authority. Moreover, the spread of digital

media has injected an army of new socializing agents into children's daily orbit; these platforms jostle with the family, and sometimes out-shout it, in shaping youthful outlooks.

Consequently, a moral and behavioral vacuum has opened up and it seldom stays empty. Unmonitored outside cues rush in, steer adolescent preferences, and, little by little, redraw their sense of self. Therefore, one now sees a mix of rule-breaking habits and a brittle, showy self-reliance—both signs that informal social control has loosened and that communal attachment is fraying. Crucially, the danger does not stop at the private doorstep; rather, it spills outward, nibbling at the shared moral order and, ultimately, at social cohesion itself.

Analytical attention must therefore pivot from diagnosis to remediation. The central imperative is to recalibrate and fortify the family's adaptive capacity within rapidly evolving structural conditions. This objective presupposes (a) the design of flexible educational models attuned to contemporary household configurations; (b) the activation of synergistic partnerships linking family, school, religious institutions, and civil associations; and (c) the deployment of targeted support and awareness programs sensitive to Algeria's dynamic socio-economic landscape.

Methodologically, the present study adopts a descriptive–analytical design. Such an approach enables the systematic delineation of conceptual parameters, the identification of causal mechanisms, and the assessment of empirical effects within the Algerian context. It maps the educational functions historically assigned to the family, specifies the empirical indicators signaling their erosion, and interrogates the statistical and experiential correlation between that erosion and emergent patterns of youth deviance. Evidence is drawn from a triangulated corpus comprising theoretical scholarship and selective field data anchored in local social reality.

First – Operational Definitions of Key Concepts

1. Family

The family is the primary social unit within which the individual is reared, typically comprising father, mother, and offspring. It constitutes the foundational agency of socialization, inculcating values, shaping personality, and directing conduct from early childhood onward.

In this article the term denotes "the educational and socio-emotional milieu that cares for the individual during formative stages, exercising a pivotal role in normative regulation and value socialization."

2. Erosion of the Familial Role

Familial erosion refers to the attenuation—or outright absence—of the family's educational and socio-regulatory functions, triggered by factors such as loosened kinship ties, parental preoccupation, economic stressors, or exogenous technological influences. Here it is understood as "a structural or functional dysfunction afflicting the family and diminishing its leverage over value inculcation and behavioral regulation of offspring."

3. Deviance

Deviance denotes any behavior that contravenes prevailing social norms, legal statutes, or customary expectations. It may manifest behaviorally (e.g., aggression), normatively (e.g., rejection of moral strictures), or criminally (e.g., theft, substance abuse). The concept is employed to mean "the cluster of negative practices into which youth drift in the wake of deficient familial guidance, such as violence, truancy, drug consumption, or affiliation with deviant peer groups."

4. Youth

It designates the age-cohort roughly spanning 15 to 30 years—a life-phase marked by psychosocial transitions and an intensified quest for identity, rendering individuals acutely sensitive to environmental stimuli, whether salutary or deleterious.

The present study concentrates on this cohort given that it bears the brunt of familial attenuation and shows heightened susceptibility to deviance when oversight and mentoring lapse.

Second – Causes of Erosion of the Family's Role and Its Repercussions for Youth

1. Socio-Cultural Transformations

- **Family disintegration:** In contemporary societies, the disintegration of the family constitutes a principal gateway to understanding one of the most visible social dysfunctions, namely youth deviance. Because the family—regarded as the first social institution—undertakes the task of primary socialization, it transmits to the child the corpus of values, norms, and behavioral restraints that facilitate social adaptation. Once the family fractures, owing to divorce, chronic conflict, or the physical or emotional absence of a parent, it loses efficacy in that critical function, thereby creating a fertile milieu for deviant conduct.

Multiple empirical studies confirm a causal relationship between fragile family bonds and elevated rates of behavioral deviance among adolescents, especially within complex urban settings. One study observes that an individual deprived of emotional gratification at home, or raised amid acute family strife, often compensates by affiliating with peer clusters that—where supervision is lacking—may draw the adolescent into substance use, violence, or moral transgression (Al-Aissaoui, 2004).

A report issued by the Arab Centre for Criminological and Social Research (2019) notes that more than 60 % of cases recorded in juvenile-rehabilitation facilities derive from disrupted or unstable family backgrounds, reinforcing the premise that an inactive family is a primary driver propelling youth towards deviance (Arab Centre for Criminological and Social Research, 2019).

The absence of modelling figures within the household, coupled with weakened guidance, lax social control, and dwindling emotional fulfilment, renders the young person more prone to adopt deviant behavioral patterns—whether to assert self-worth, to fill an affective void, or under the sway of ill-disciplined peers or negative media content. Consequently, family disintegration is not an isolated issue but an explanatory key to a broad spectrum of youth-deviance phenomena. Addressing it demands a multilayered intervention—psychological, educational, and social—aimed at re-empowering the family, supporting disrupted households, and forging partnerships among educational and social institutions.

The Algerian reality diverges little from the general Arab context. In fact, certain indicators reveal a marked rise in the phenomenon owing to profound socio-economic transformations experienced over recent decades. Official statistics record more than 60 000 divorces annually in recent years, signaling widespread family dissolution and leaving growing numbers of children and adolescents in unstable domestic environments (National Office of Statistics, 2022).

These findings align with Belkacem's 2018 study on the impact of paternal absence in Algerian families, which observes that the lack—or weakening—of paternal authority deprives adolescents of a reference model, impelling them to seek alternative identities that may be constructed through behaviors contravening social norms, especially in the absence of preventive programs or supportive institutions for vulnerable families (Belkacem, 2018).

The situation further deteriorates in impoverished, marginalized urban quarters where unemployment, poverty, exclusion, and the paucity of alternative pedagogical frameworks accumulate, exposing the young person to urban violence or street- and gang-related subcultures.

Linking family disintegration to youth deviance in Algeria is no longer merely theoretical; field data and scholarly evidence substantiate the connection. The state and civil society therefore need to activate preventive and remedial mechanisms: reinforce psycho-social support schemes for fractured households, reinvigorate alternative socializing agencies—mosque, school, youth associations—and shield the rising generation from sliding into destructive behavioral trajectories.

- **Erosion of Familial Values**

Family values set the compass: they steer children's conduct, shape their personalities, and steady their intellectual and behavioral bearings. Over the past twenty years, however, that compass has begun to wobble. Economic strain now presses heavily on many Algerian households; everyday schedules shift almost weekly, and the parental division of labor bears little resemblance to earlier decades. Consequently, the home's capacity to guide, advise, and correct has thinned. In particular, long hours spent by mothers in paid work—together with fathers either overwhelmed by breadwinning duties or sidelined by unemployment—interrupt ordinary parent-child contact. A clear pedagogical vacuum follows. Core norms such as respect for authority, self-discipline, group loyalty, and religious identity no longer move with the same ease from one generation to the next. The problem is not simply a lack of warmth or physical presence; rather, the family's moral code—once passed on almost implicitly—now stalls in transit. As a result, when oversight slackens, adolescents look outward: television, the street, and an ever-expanding digital world supply replacement value systems that compete with, and sometimes overwrite, the lessons once learned at home. More often than not, these imported scripts clash with local culture and with the community's ethical and religious foundations.

Additional indicators reinforce the thesis of attenuated family values. Across the Arab region in general, and in Algeria in particular, recent decades have witnessed an unprecedented influx of foreign cultures, propelled by the media-communication revolution and the explosion of Internet and social-network use among youth cohorts. This profound openness has reconfigured the sources from which the rising generation acquires values and knowledge; no longer does the family monopolize socialization. Young people now confront rival value references that may contradict familial and societal norms.

Within this climate, the family has ceded its primacy as an educational agent to digital media, which disseminate behavioral templates, linguistic codes, and cultural symbols frequently antithetical to local cultural-religious identity. Bouzidi (2019) observes that "the Algerian child now consumes foreign media content from the earliest years, thereby internalizing a value system distinct from the system the family attempts to instill" (Bouzidi, 2019).

Ben Zidane (2022) adds that more than sixty-five % of Algerian adolescents spend daily in excess of four hours before screens—mobile phones, computers, televisions—without effective parental monitoring, exposing them to cultures of violence, individualism, rebellion, or emulation of models alien to their milieu (Ben Zidane, 2020). Such exposure directly fractures value identity and fosters deviance, particularly in youth.

The displacement of traditional value sources yields a personality marked by value dualism, torn between the demands of local cultural belonging and the allure of Western exemplars. Absent adequate familial and school guidance, many young people drift into axiological disjunction that may escalate into deviant behaviors: rejection of authority, rebellion, violence, substance use, or attraction to virtual communities that cultivate anti-social proclivities.

The technological surge—and, with it, the rise of new media, especially the Internet and social-network platforms—has thrown Algerian youth wide open to foreign cultures. More often than not, these cultures celebrate values at odds, even in direct conflict, with local social and religious norms. Consequently, the reference points that once guided young people have been rearranged: the family and the school no longer hold a near-monopoly on guidance; instead, border-blurring digital content now fills that role.

In practice, the resulting value slippage shows up across Algerian society in several ways:

1. Rising rates of juvenile and youth delinquency, most visibly in the large urban centers such as Algiers, Oran, Annaba.

2. Widespread, uncritical imitation of Western styles—clothing, music, defiant stances toward authority, patterns of intimate relations—particularly among marginalized groups.

3. Heightened tension within the household, fuelled by an ever-widening generation gap and, crucially, the near-absence of genuine dialogue channels.

4. Affiliation with deviant or extremist electronic groups that offer a trans-local, substitute identity.

Hence, outside cultural currents cannot be disentangled from the rise of youth deviance in Algeria; they act as one of its deep-running motors, steadily eroding parental authority and dulling the household's ability to steer or restrain behavior. At the same time, the classic roles of father and mother as everyday mentors are thinning under cumulative strain. Like many Arab households, the Algerian family has been reorganized from within, most visibly in the arena of day-to-day child-rearing. Not long ago, the home functioned as a compact unit—paternal authority was clear, duties were split, and order, along with guidance, followed almost automatically. Today, economic stress, a mother's longer hours in paid work, and stubborn unemployment among fathers have chipped away at that arrangement; close monitoring of children has become the exception rather than the rule.

Significantly, the diminished educational role of parents does not represent a chance anomaly confined to a few households. Rather, it signifies a systemic response to sustained structural pressures that now shape Algerian social life. In view of these conditions, strengthening intra-familial educational capacities ought to feature prominently in any holistic prevention framework. When the home no longer supplies a reliable normative horizon, adolescents tend to anchor themselves to external value systems which so often legitimize rebellion or pave the way to outright deviance.

2. Economic Conditions:

* ***Poverty and Unemployment: Social Marginalization and the Erosion of Family Authority in Algeria.***

Economic crises stand out as a primary force pulling apart the Algerian family's functional fabric where poverty and joblessness have settled in as long-term realities, most sharply felt in marginalized city districts and in out-of-the-way rural zones. Consequently, parents—fathers above all—spend much of their energy wrestling with material pressures. Emotional availability wanes; pedagogical oversight thins; outside influences, some of them risky, slip into the empty space.

Bouchama 'Abd al-Kader (2019) drives the point home: "Prolonged economic stress and unemployment sap a father's sense of control and influence. He turns inward—or simply checks out—thereby weakening his role as the household's behavioral gatekeeper" (Bouchama, 2019). In turn, this pedagogical vacuum breeds feelings of deprivation and exclusion among children, nudging them toward alternative—sometimes deviant—routes to social recognition.

In the same vein, Ben Ghazal (2021) shows that financial instability cultivates a *laissez-faire* socialization style: norms loosen, monitoring vanishes, and the street or digital media becomes the chief socializing agent, thereby amplifying the probability of deviance, violence, or affiliation with rebellious subcultures (Ben Ghazal, 2021).

Peripheral neighborhoods in Algeria's major cities exhibit high concentrations of unemployment among both youth and fathers, producing socially fragile families. Economically deprived young people display a heightened propensity to challenge authority, repudiate traditional values, or engage in violent behavior, substance use, and petty theft as strategies of survival and recognition. Unemployed fathers, meanwhile, endure chronic stress and a sense of lost control, conditions that poison the household climate and precipitate the psychological and symbolic fragmentation of the family as a nurturing institution.

Parental Work Preoccupation: Temporal Pressures Undermining Familial Equilibrium in Algeria

With the economic and social reconfigurations that have unfolded since the 1990s, Algerian households have experienced an unprecedented expansion in off-site labor hours, especially following the broad entry of women into the paid workforce. This shift has re-scripted intra-familial relations: both parents now confront occupational demands that absorb time and energy otherwise invested in child-rearing, behavioral monitoring, and the psychosocial tracking of their offspring.

Laouadj Samira's 2021 study reports that "the average daily span parents spend with their children in Algeria's major cities does not exceed two hours," a window rarely devoted to substantive guidance or dialogic interaction, but rather to perfunctory everyday logistics (Laouadj, 2021). Such attenuated affective and pedagogical engagement weakens children's anchorage to familial reference points and leaves them open to extra-familial vectors of influence—the street, mass media, or digital networks.

Long work shifts create an educational vacuum within the household, a void that is spontaneously populated by external actors who may be unreliable or even perilous. The risk intensifies in the absence of intermediary institutions—youth clubs, mosques, schools—capable of supplying value containment. Under these conditions, adolescents face elevated odds of adopting deviant trajectories: verbal or physical aggression, tobacco use, or compulsive internet consumption (Najafov, 2021).

Specificities of the Algerian context

- Escalating living costs compel many families to depend on dual earnings, thereby magnifying parental absenteeism.
- In large urban centers, extended commuting between residence and workplace further widens the temporal gulf separating parents from children.
- An underdeveloped lattice of alternative pedagogical infrastructures (co-curricular activities, care facilities) exacerbates the situation, producing unsupervised youth who construct their value systems in unregulated milieus and thus become more susceptible to deviant conduct in the absence of sustained guidance.

Modern Technology: Social Media and the Erosion of Familial Bonds – A Sociological Approach on the Algerian Setting

During the past two decades, Algeria has witnessed a sweeping expansion of social-media use that has recalibrated intra-household relations. The smartphone or personal computer now mediates children's primary interactions with their surroundings, while the family's traditional role as the chief locus of normative oversight has contracted. As digital immersion grows, symbolic and psychological distance widens inside the family, most sharply between parents and their children. Spending more than four hours a day online has become common among adolescents; the habit dampens both the quantity and the quality of face-to-face exchange, thereby weakening the circulation of long-standing values. Moreover, many platforms parade behavioural, linguistic, and cultural models that sit uneasily with local norms. Youth, in turn, become more receptive to adopting alternative identities that diverge from the community's own heritage (Najafov, 2024).

Patchy digital guidance at home is breeding a cohort of youngsters who feel emotionally adrift and morally fragile; a clever meme, a charismatic streamer, or an online clique can steer them with little resistance—sometimes just for laughs, sometimes with an overt ideological agenda.

- Social-media saturation. Algerian teens now spend long stretches on platforms that glorify verbal aggression, mock parental authority, and celebrate open defiance.
- Risk-laden "challenges." Closed groups invite them into dangerous dares—cyber-bullying, smear campaigns, or overtly unethical stunts—turning transgression into a badge of daring.
- A dialogue deficit at home. With kitchen-table conversation in short supply, these platforms step in as an all-day, unsupervised classroom. Identity shifts from family circle to digital tribe; unfiltered access to hate content, "digital highs," or illicit liaisons normalizes deviance and masks subtler harms such as online cruelty until they are firmly rooted.

Attenuated Educational Guidance: Absence of Family–School Synergy and the Resultant Distortions in Algerian Youth Socialization:

Many urban Algerian households lean almost entirely on the school to supply moral direction. Yet classrooms cannot replace parental care, daily behavioural monitoring, or the steady psychological backing that a home should provide. Separated like this, the two spheres fail to reinforce one another, and young people end up with a fractured value framework—especially given that the current education system offers few effective safety nets of its own.

Lack of coordination yields not only cognitive lacunae but also identity perturbations, weakened belonging, and an attenuated sense of social responsibility in pupils, rendering them more vulnerable to peer-group influence and deviant conduct. A field study in Tipaza Province conducted by Khalfaoui Fouad (2019) found that more than 64 % of deviant youth had no regular dialogue with their parents regarding their scholastic life; some had never discussed academic or behavioral problems with either parent (Khalfaoui, 2019). Algerian schools typically exhibit a fragile liaison between teaching staff and guardians, which leaves adolescent supervision partial at best. Certain families confer unqualified authority upon the school to discipline and guide their offspring, intervening neither in truancy nor in troubling behaviors. This tendency is acute in working-class or marginalized districts where families, burdened economically or culturally, lack either the capacity or the awareness necessary for sustained educational follow-up. The resulting impression of neglect fosters indifference among adolescents, who then seek alternative loci of affiliation; the absence of family–school coordination consequently undermines the efficacy of any pedagogical intervention and accelerates pathways into deviance (Najafov, 2025).

5 –Absence of Parental Role Models and Its Impact on Youth Deviance in Algeria

Parental example stands at the center of socialization. From father and mother, children draw their first rough map of moral conduct and acceptable behavior. During recent decades, however, Algeria has undergone social and economic shifts that have unsettled this arrangement. Many youngsters now grow up in homes where both parents are perpetually occupied, locked in chronic conflict, or physically absent through divorce, migration, or death. In such settings, the child loses daily contact with a stable and positive model.

This void operates as a powerful but indirect driver of deviance. Faced with ordinary challenges, the adolescent finds no reliable pattern to imitate; decision-making wavers, norms blur, and the pull of peer groups grows stronger. In that uncertain space, street cohorts and online influencers step forward, offering themselves as substitute guides.

Third – Remedies for Youth Deviance Triggered by Familial Erosion in Algeria

1. Reinforcing the Family's Socializing Function

The most immediate route to curbing behavioral deviance is, quite simply, to restore the household to its former standing as the primary builder of a child's social and psychological formation.

- Parent-training workshops. Local social-affairs and education departments could run short, hands-on sessions for mothers and fathers. Topics would range from the principles of positive discipline to the twin challenges of adolescent mood swings and unfiltered digital content.

- Awareness media. Regional radio and television slots might lay bare the long-term cost of parental neglect while, at the same time, offering concrete portraits of families that have managed to keep both warmth and structure.

- Family-life content in the curriculum. A practical proposal is to weave basic lessons on household communication and relationship skills into existing civics periods or into co-curricular clubs, so pupils learn early how a healthy family system works.

2. Value-Centered Guidance at Home

Moral prevention begins in the living room. Thus, fostering a culture of dialogue, mutual respect, and belonging is key.

- Shared decision-making. Involving children in small household choices nurtures their sense of responsibility.
- Weekend rituals. Joint outings, collaborative cooking, or visits to extended kin thicken emotional bonds and create a supportive climate.

2. Steering Digital Media inside the Home

Social-network sites now rival parents for influence. Total bans rarely work, yet doing nothing lets the screen win by default. A wiser path is to draft clear family pacts on screen hours and, step by step, train children to police their own online habits.

IV. Recommendations

Drawing on the foregoing analysis, the following research-based proposals target families, the wider community, and public institutions. All aim to curb youth deviance that stems from a weakened household role.

A. Recommendations for Families

1. **Strengthen parents' emotional and physical presence** by reserving daily time for conversation and psychological support, even amid work and life pressures.
2. **Restore the role of a "positive role model" in the household** by consistently demonstrating behaviors worth imitating, particularly in moral and ethical situations.
3. **Maintain continuous educational supervision** alongside school efforts, rather than treating formal instruction as the sole builder of a child's character.
4. **Boost parents' digital awareness** and accompany children on social-media platforms, setting firm boundaries and offering ongoing guidance.

B. Recommendations for Schools and Other Educational Bodies

1. **Tighten school–home collaboration.** Schedule regular parent–teacher gatherings and, at the same time, roll out simple digital platforms that let both sides track a pupil's conduct and value development in real time.
2. **Open family-awareness corners on campus.** Use clubs or parent associations to run short workshops where mothers and fathers pick up practical skills in both psychological support and digital supervision.
3. **Keep staff training alive.** Offer ongoing courses that show teachers how modern socialization works and how to engage more effectively with each learner's household context.

C. Recommendations for Civil Society and the Media

1. **Run nationwide outreach on family fragility.** Explain, in plain language and with real-life examples, how a weakened household structure feeds directly into youth deviance.
2. **Empower neighborhood NGOs.** Encourage local associations—especially in under-resourced districts—to act as go-betweens for schools and families.
3. **Produce constructive media content.** Highlight stories that celebrate traditional family values and underline the power of solid role models in shaping a balanced generation.

D. Recommendations for Public Authorities and Policy-Makers

1. **Draft family-friendly social policies.** Combine targeted financial aid, incentives that reward household stability, and access to decent housing—priority to low-income and single-parent units.

2. **Set up counselling hubs for troubled families.** Give parents a safe place to talk, seek educational advice, and resolve conflicts before they escalate.

3. **Build family education into national schooling.** Embed the topic in curricula and require it in teacher-training programs.

Shielding Algerian youth from deviance starts with repairing the family setting and restoring its educational and moral weight. Meeting that goal demands a coordinated national effort—parents, schools, media outlets, civil groups, and government working in concert to raise a generation that stands firm against destructive influences and engages thoughtfully with the challenges of our time.

Conclusion

The family's waning influence in Algeria is no passing adjustment in lifestyle; rather, it signals a deep reworking of the traditional socialization scaffolds that once seeded values and regulated conduct. Both survey data and field studies tie this decline to sharper spikes in youth deviance, weaker moral discipline, and an unsettling rise in alienation.

Several forces converge here. Economic strain—poverty, chronic unemployment—shrinks household stability. Daily pressures, including long work shifts, sap the hours parents can spend with their children. Add an unfiltered digital sphere, and the result is clear: during the very stages when guidance matters most, the parental voice grows faint. Into that silence slip unmonitored outside influences that chip away at the young person's moral footing and steer some toward risky behavior.

Curbing this drift is not the parents' task alone. It calls for concerted action—family, school, mass media, religious and cultural bodies all pulling in the same direction. Where the household regains coherence and authority, it still offers the best shield: a setting that fosters psychological wellbeing, ethical self-control, and constructive civic engagement.

Ultimately, the crucial wager is less about drafting solutions than about mustering the political and social will to carry them out. Algeria needs a broad national agenda that fortifies the family. A society unwilling to guard its own households will find it difficult—if not impossible—to safeguard its youth, or its future.

Acknowledgment

The authors would like to express their gratitude to Yahia Fares University, Médéa, Algeria, for providing the academic environment that facilitated the completion of this research. Special thanks are extended to colleagues and peers who contributed constructive feedback during the development of this article.

Conflict of Interest

The authors declare no conflict of interest related to the publication of this article.

Keywords Digitalisation, Gouvernance d'entreprise, PME, asymétries d'informations, enracinement des dirigeants, Contexte Algérien

Abstract

Le but de ce travail est de démontrer l'impact de la digitalisation sur la gouvernance d'entreprise à travers une étude de cas menée au sein de la PME algérienne CASA médical. Dans un contexte où les entreprises algériennes amorcent graduellement leur transition digitale, la question de la réduction des asymétries d'informations entre les parties prenantes, l'atténuation de l'opportunisme et d'enracinement des dirigeants prend une importance croissante. Pour ce faire, une démarche qualitative basée sur un guide d'entretien semi-directif a été mobilisée, d'où on analyse comment les outils digitaux conditionnent le partage de l'information et la prévision des comportements opportunistes. Les résultats confirment que la digitalisation favorise une transparence accrue et une meilleure traçabilité. L'étude met en évidence les opportunités offertes par la digitalisation pour renforcer la gouvernance d'entreprise, et souligne les limites structurelles du contexte Algérien. On conclut notre article par des recommandations pour les PME et des pistes de recherches futures.

Introduction :

Après les faillites spectaculaires de grandes entreprises en 2002 aux États-Unis, et même avant cela dans d'autres pays, le concept de gouvernance d'entreprise prend de plus en plus d'importance. Aujourd'hui, la gouvernance d'entreprise est au cœur des débats relatifs à la durabilité, à la performance des entreprises et

à l'amélioration de l'efficience économique. Dans ce contexte, la digitalisation apparaît comme une opportunité pour améliorer les pratiques de gouvernance et créer de la valeur pour toutes les parties prenantes de l'entreprise.

Il est donc primordial d'analyser la corrélation entre la digitalisation et l'amélioration de la gouvernance d'entreprise en Algérie. À cet effet, nous tenterons de répondre à la problématique suivante :
« Quel est le rôle de la digitalisation dans l'amélioration de la gouvernance d'entreprise de CASA Médical ? »

À cette problématique s'ajoutent plusieurs questions secondaires :

- Comment la digitalisation a-t-elle changé la manière dont l'information est partagée au sein de l'entreprise ?
- Dans quelle mesure la digitalisation a-t-elle contribué à réduire l'asymétrie de l'information dans l'entreprise ?
- En quoi la digitalisation peut-elle contribuer à atténuer les risques d'opportunisme ?
- Comment la digitalisation a-t-elle modifié la nature ou l'ampleur des conflits d'agence au sein de l'entreprise ?

Pour répondre à cette problématique, nous allons suivre le plan suivant :

1. Cadre théorique et revue de la littérature

1.1. Définition de la gouvernance d'entreprise :

Pour Perez (2009), la gouvernance d'entreprise se définit comme étant « une discipline ayant pour objet central les dirigeants, qui s'exerce au bénéfice des parties prenantes à travers un dispositif institutionnel spécifique (S-P-C) ».

- **(S)** représente l'ensemble des structures internes (conseils d'administration, assemblées générales, etc.) et des structures externes (marchés financiers, autorités de régulation, etc.);
- **(P)** désigne les procédures plus ou moins explicites telles que les lois, règlements, recommandations, codes de déontologie ;
- **(C)** renvoie aux comportements, qui varient selon les objectifs poursuivis par les agents économiques.

L'articulation de ces trois composantes (S-P-C) définit la manière dont le système de gouvernance est structuré et régulé. Le contenu institutionnel des dispositifs de gouvernance repose sur l'ensemble des structures et procédures, tandis que la mise en œuvre et l'animation du système de gouvernance dépendent du comportement des individus

1.2. La digitalisation : Un état de l'art

G. Babinet distingue, dans son ouvrage *Ère numérique, nouvel âge pour l'humanité* (cité par J.M, 2017), trois périodes clés de l'évolution numérique des sociétés :

a. La période du matériel informatique (1945–1985)

L'apparition de l'informatique permet le remplacement progressif des documents physiques par des supports numériques. Les opérations administratives sont informatisées grâce à des applications indépendantes, comme l'informatisation de la comptabilité ou de la gestion des ressources humaines. Dès les années 1970, apparaissent les premiers réseaux locaux.

b. La période du logiciel (1985–2005)

Des plateformes informatiques et des logiciels de gestion intégrée apparaissent. La communication interne et externe devient plus fluide grâce aux ERP. L'essor du e-commerce est marqué par des jalons comme le lancement de la première plateforme commerciale en ligne dans les années 1990, la création de Google en 1998, ou encore l'émergence de Yahoo, eBay et Amazon.

En 2002, le Cloud computing est lancé, ouvrant une nouvelle ère technologique et bouleversant les dynamiques économiques, marquant l'entrée dans l'économie numérique

c. La période de la donnée (2005 à nos jours) :

Cette phase est caractérisée par l'explosion des données (Big Data), l'utilisation intensive du Cloud, l'interactivité via les réseaux sociaux et les échanges en ligne (e-commerce, e-mails, etc.).

Aujourd'hui, la notion de donnée renvoie au concept de Big Data. Selon L. Bremme (2016), « le Big Data est un ensemble très volumineux de données qu'aucun outil classique de gestion de l'information ne peut vraiment traiter ».

1.3. La digitalisation et la gouvernance d'entreprise

La digitalisation, couplée à l'intelligence artificielle et à la blockchain, bouleverse profondément la gestion des entreprises. Dans certains pays, la gouvernance numérique fait déjà partie intégrante des pratiques : le Royaume-Uni, l'Afrique du Sud, les Pays-Bas ou encore la Russie ont intégré la gouvernance des risques technologiques dans leurs codes de gouvernance d'entreprise (depuis 2016).

Les bénéfices attendus de la digitalisation incluent :

- L'accélération des processus décisionnels
- L'amélioration de la transparence
- La prévision des risques
- Le suivi des résultats

Une étude menée en 2015 par le Forum économique mondial révèle que 75,4 % des PDG interrogés estiment que d'ici 2025, 30 % des audits d'entreprise seront réalisés par intelligence artificielle. De plus, 45,2 % pensent que des robots dotés d'IA pourraient intégrer les conseils d'administration.

2. Présentation de l'Etude de cas « CASA MEDICA »

CASA MEDICA Sarl est une société Algérienne active sur le marché Algérien depuis 2007. Elle est spécialisée dans les domaines de la physiothérapie, de la médecine physique, de la médecine sportive et de la médecine esthétique. Son rôle principal est de fournier un soutien décisionnel afin de :

- Informer les pouvoirs publics sur l'état des connaissances scientifiques, leurs implications médicales, organisationnelles ou économiques, ainsi que leur impact sur la santé publique.
- Aider les établissements de santé à répondre aux besoins des patients afin d'améliorer la qualité des soins.
    - Soutenir les professionnels de la santé et les aider à développer et mettre en œuvre les meilleures stratégies diagnostiques et thérapeutiques selon les critères requis.
    - Offrir aux clubs sportifs et aux différents centres de fitness la possibilité d'être équipés des dernières technologies.

- S'assurer que les besoins de la médecine esthétique et des centres de bien-être sont satisfaits et offrant les dernières innovations dans le domaine de l'esthétique et de l'amincissement.

Son acticité est divisée en trois domaines :

- Commercial : Promotion et ventes.
- Technique : Installation, suivi technique et entretien des équipements.
- Formation : Organisation, promotion et prestation de formations, de cours et de séminaires sur le biomédical.

Leurs principaux clients :

- Hôpitaux publics ou militaires spécialisés
- Cliniques et cabinets privés
- Physiothérapeutes et médecins de réadaptation (MPR)
- Clubs et fédérations sportives
- Centres de fitness et de bien-être
- Centres de thalassothérapie
- Centres sportifs
- Centres de beauté et minceur

3. Méthodologie :

Cette recherche empirique fait l'objet d'une enquête qualitative via des entretiens semi-directif (voir le guide d'entretien en annexes), menées auprès des acteurs de la gouvernance de notre étude de cas CASA médical, représentant différentes fonctions clés : direction, technique,direction financière, audit interne, conformité, gestion,etc. Nous avons obtenus des informations nécessaires pour détecter la corrélation entre l'amélioration de la gouvernance d'entreprise et la digitalisation, à travers trois axes basés sur trois hypothèses à savoir :

 La digitalisation, en améliorant l'accessibilité et la disponibilité de l'information, et en facilitant la communication interne, réduit les asymétries d'information entre les parties prenantes.

 L'optimisation des mécanismes de contrôle par les outils digitaux contribue à limiter les comportements opportunistes des dirigeants.

 En renforçant la transparence, la responsabilisation et l'efficacité managériale, la digitalisation permet de faire face aux différentes formes d'enracinement des dirigeants.

Les entretiens ont duré en moyenne entre 45 et 60 minutes, en présentiel,et ont fait l'objet d'un enregistrement audio suivi d'une transaction intégrale.
L'analyse de cette étude empirique qualitative passe en premier lieu par l'analyse des réponses des interviewées.

3.1. Profil des répondants :

Le tableau suivant présente les profils codés des répondants, selon leur fonction, afin de contextualiser leur contribution à l'analyse de l'impact de la digitalisation dans la gouvernance d'entreprise :

Tableau n° 01 : Profil des interviewés

Code	Fonction
R1	Directeur technique (Médecin en pharmacie)
R2	Fondatrice (Ingénieur polytechnique)
R3	Responsable audit interne
R4	Directeur financier

R5	Expert-comptable agrée
R6	Responsable conformité
R7	Co-manager (Responsable de la gestion d'entreprise)
R8	Consultant en gouvernance

Source : établi par l'auteur, données issues des entretiens

3.2. Justification du nombre restrient d'entretiens

Le nombre de huit entretiens, bien qu'apparu restreint, est justifié méthodologiquement pour trois raisons principales :

- Saturation théorique : Après le7e entretien aucune information nouvelle n'est apparue, ce qui correspond au seuil de saturation reconnue en recherche qualitative (Guest et al.,2006)
- Spécificité du terrain : une seule PME famillíale àstructure managérial compacte (Etude de cas), limitant automatiquement le nombre de profils pertinents à interroger.
- Diversité fonctionnelle : nous avons sélctionner les répondants pour garantir une variété de perspectives internes (direction, technique, finance, conformité, conseil), renforçant la richesse des données malgré le nombre restrient d'entretiens.

3.3. Traitement des données par codage thématique

Les verbatims issus des entretiens ont été analysés manuellement selon la méthode du codage thématique inductif, en trois étapes :

1. Codage ouvert : identification dans les propos des interviewés les unités de sens significatives.
2. Codage axial : regroupement en catégories intermédiaires des extraits.
3. Codage sélectif : organisation des résultats autour des thèmes centraux liés aux hypothèses posées.

Le traitement a été réalisé manuellement, sur tableau Exel, nous avons croisez les données issues des différents répondants dans le but de faire émerger des régularités.

3.4. Analyse thématique qualitative

Les principaux axes thématiques identifiés à la suite de l'analyse qualitative des entretiens sont présentés dans le tableau ci-dessous:

Tableau n° 02 : Analyse thématique qualitative

Thèmes principaux	Éléments relevés
Le partage d'information	Fluidité, centralisation, visibilité en temps réel grâce aux outils digitaux
La réduction de l'asymétrie informationnelle	Accès équitable à toutes les données, transparence dans tous les départements.
Le risque d'opportunisme	Favoritisme, manipulation des chiffres, usage excessif des ressources.
L'impact de la digitalisation	Suppression des comportements opportunistes, automatisation des enregistrements, traçabilité
La détection et la prévision d'abus	La détection d'anomalies internes via les ERP.
Les conflits d'agences	Réduction des conflits d'agence en partageant des données mesurables.
Les outils digitaux efficaces	ERP, reporting automatisé, signature électronique, tableaux de bord interactifs
Le contexte Algérien	Adoption tardive, besoin de formations.

Source : établi par l'auteur, données issue des entretiens

3.5. Lien entre hypothèses et résultats

Tableau n°03 : Tableau de synthèse

Hypothèse	Exemple de verbatim observés	Validation empirique
H1 : La digitalisation réduit l'asymétrie d'information	« le partage des chiffres de vente et de stock se fait via Google Drive ou l'ERP... », « tout les employeés ont accès au meeme reporting... »	Validée – Transparence accrue et centralisation
H2 : La digitalisation limite l'opportunisme des dirigeants	« Les décisions sont plus traçables », « On ne peut pas tricher tant que les signatures sont horodatées », « Toutes les réunions en ligne sont enregistrées »	Validée- Traçabilité et contrôle amliorés
H3 : La digitalisation permet de limiter l'enracinement des dirigeants	« Pas de décision concentrées entre deux personnes ou entre un seul groupe », « Les anomalies sont visibles en temps réel. » « tout le monde accède aux données, même les associés à distance "	Changement observé : moins de pouvoir centralisé, mais des limites culturelles persistantes.

Source : établi par l'auteur

4. Résultats :

4.1. Digitalisation et partage de l'information

CASA Médical a transformé en profondeur ses processus de communication grâce à la digitalisation. Un partage fluide et en temps réel de l'information est établi via des outils tels que les plateformes de messagerie professionnelle, les ERP, les tableaux partagés... Ce recours a réduit la dépendance aux échanges informels et aux réunions physiques.

« Aujourd'hui, nous avons la possibilité d'avoir une information plus visible par tous les responsables et presque en temps réel, en utilisant des outils comme WhatsApp Business, des tableaux partagés sur Google Drive et un ERP local qui centralise les commandes, les stocks et les vents. » R4.

4.2. Réduction de l'asymétrie de l'information

L'asymétrie d'information entre les différents niveaux hiérarchiques a été réduite de manière notable en assurant l'accès équitable aux données opérationnelles de l'entreprise. Grâce à cette centralisation des données, les décisions prises par les dirigeants sont devenues plus objectives et peuvent être partagées.

« Avec l'accès à la même base de données clients, aux prévisions et aux chiffres de ventes par les commerciaux, les logisticiens et les décideurs, nous avons pu éviter que certains aient plus d'informations que d'autres et qu'ils prennent des décisions à leur avantage » R7.

4.3. Risques d'opportunisme des dirigeants

Le manque de transparence et de contrôle facilite les comportements opportunistes des dirigeants. L'entreprise identifie plusieurs risques d'opportunisme de la part des dirigeants tels que la manipulation des chiffres, la surexploitation des ressources à des fins personnelles, le favoritisme

dans l'octroi d'avantages injustifiés du marché.

« Un dirigeant peut justifier certaines dépenses juste en gonflant artificiellement les besoins ou en faussant les rapports » R3.

4.4. Contribution de la digitalisation à la régulation

Avec les outils digitaux, chaque action ou transaction laisse une trace, ce qui permet une traçabilité complète ; il est difficile de cacher une opération suspecte. Cela limite les marges de manœuvre pour des comportements opportunistes et incite les dirigeants à être plus prudents.

« Quand tout est enregistré : commandes, approbations, mouvements de stock, etc., on détecte les comportements anormaux dans la gestion, prouvées par une incohérence entre les ventes réelles et les achats enregistrés "R5.

4.5. Conflits d'agence et outils digitaux

La digitalisation a également réduit certains conflits d'agence, notamment entre les actionnaires et les dirigeants, en rendant les données disponibles et plus objectives par la mise en place de tableaux de bord partagés et de systèmes de reporting.

« Les discussions sont plus objectives grâce aux outils de reporting. On peut affirmer que les chiffres sont fiables. » R8.

4.6. Outils digitaux favorisant la gouvernance

CASA Médical utilise une palette d'outils digitaux : ERP, tableaux de bord interactifs, reporting automatisé, plateformes de signature électronique. Ces outils permettent un contrôle meilleur, une transparence accrue et une grande responsabilisation des acteurs, cela facilite la concrétisation des pratiques de la bonne gouvernance.

« ... Oui, je confirme que l'utilisation des tableaux de bord partagés, des audits numériques, des outils de signature électronique sécurisée et des plateformes de reporting automatisées permet plus de transparence et un meilleur contrôle. Avec l'utilisation de ses outils, la marge d'interprétation ou de manipulation se réduit et le climat de confiance se crée. "R1.

4.7. Spécificité du contexte Algérien

En Algérie, nous sommes encore au début du chemin. Beaucoup d'entreprises restent attachées à des pratiques traditionnelles, bien que ce soit un levier important pour une gouvernance plus efficace. Elles hésitent à digitaliser par manque de moyens et peur du changement. Ce retard dans l'adoption digitale constitue un réel frein.

Pour accélérer la transition, le soutien institutionnel via des programmes d'accompagnement ou des incitations fiscales serait nécessaire.

« La digitalisation offre de vraies opportunités pour renforcer la gouvernance, mais sans accompagnement, les outils seuls ne suffisent pas. Les décideurs ont encore une résistance culturelle et un manque de formation digitale, c'est le moment de changer les mentalités » R8.

5. Discussion :

Dans le cadre de cette étude qualitative les résultats obtenus mettent en lumière le rôle croissant que joue la digitalisation dans le renforcement de la gouvernance d'entreprise en Algérie. Les apports majeurs dégagés sont les suivants :

- L'atténuation de l'opportunisme des dirigeants
- L'atténuation des conflits d'agence
- L'amélioration de la transparence informationnelle

5.1. Convergence avec la littérature

Les données analysées confirment plusieurs constats établis dans la littérature :

- La digitalisation améliore la transparence informationnelle, comme les montrent également les travaux de **Gealy & Palepu (2001)** et **Bushman et al (2004)** sur la réduction de l'asymétrie d'information par le digital.
- L'accès aux données et la traçabilité via des outils numérique (ERP, Business Intelligence, plateforme de gouvernance) ont permis de limiter les comportements opportunistes, ce qui rejoint les travaux de Lensen **& Meckling (1976)** dans le cadre de la théorie de l'agence.
- Enfin,La digitalisation renforce les capacités de contrôle managérial et de surveillance des dirigeants, ce qui va avec les études de **Weill & Ross (2004)** et de **Tapscott et al (2006)** sur la gouvernance numérique.

5.2. Apports spécifiques au contexte Algérien

Plusieurs éléments confirment que la généralisation des outils digitaux reste limitée en Algérie et que le contexte Algérien possède des spécificités importantes :

- La digitalisation pourrait jouer un rôle plus stratégique en gouvernance, au lieu d'être perçue comme un outil technique uniquement.
- Le déploiement optimal des outils est freiné par manque de compétences digitales et une résistance culturelle persistante.
- L'usage de numérique est rarement intégré dans les processus de contrôle stratégique, il reste généralement limité aux fonctions administratives.

5.3. Implications pratiques

On déduit plusieurs implications pour les entreprises algériennes à partir des résultats de cette recherche :

- La nécessité d'une prise de conscience managériale pour faire de la digitalisation un véritable levier de gouvernance.
- La nécessité de l'accompagnement structurel ainsi que le renforcement de la formation des dirigeants à la gouvernance digitale.
- La nécessité d'intégrer dans le processus décisionnels les outils de reporting interactif et de traçabilité.

De même, pour une véritable diffusion de bonnes pratiques digitales, les organismes d'accompagnement et les pouvoirs publics (ANDPME, CACI, CNRC...) peuvent jouer un role important dans la diffusion de ces pratiques.

5.4. Confirmation partielle des hypothèses

En confrontant les résultats aux hypothèses formulées, on peut conclure que le modèle théorique a été validé globalement, avec quelques nuances :

- Il est largement accepté que la digitalisation a un impact sur l'asymétrie d'information en facilitant l'accès et l'interprétation partagés des données.
- Il est largement accepté que la digitalisation a un effet sur l'opportunisme en agissant comme un mécanisme de régulation.

- L'impact sur l'ancrage est en cours, mais il reste encore partiellement conditionné par les facteurs humains et culturels.

5.5. Limites de l'étude :

On constate les limités méthodologiques suivantes :

- L'impossibilité de généraliser les résultats, vu le nombre restreint d'entretiens.
- Bien que les profils des répondants soient variés, ils ne couvrent qu'un seul secteur d'activité (Notre Cas d'étude, le secteur tertiaire)

  Néanmoins, la richesse des discours recueillis et la diversité des fonctions représentées permettent de compenser partiellement ces limites.

5.6. Perspectives de recherche

A la suite de cette recherche plusieurs pistes peuvent être explorées :

- Une étude quantitative sur un échantillon plus large afin de tester statistiquement les corrélations entre la digitalisation et la qualité de gouvernance.
- Une analyse sectorielle approfondie. Permettant de comparer les effets de la digitalisation dans différents domaines d'activité.
- Une étude sur les facteurs de succès de lagouvernance digitale dans les PME Algérienne.

Conclusion :

La gouvernance d'entreprise vise à garantir un fonctionnement efficace, aligné sur les objectifs stratégiques, tout en protégeant les intérêts des différentes parties prenantes (dirigeants, actionnaires, administrateurs et parties externes). Elle permet également une meilleure gestion des risques et un encadrement plus rigoureux des processus décisionnels.

Avec l'avènement du digital, la digitalisation apparaît comme un levier stratégique susceptible de renforcer les pratiques de la gouvernance.

Le présent travail apporte une indication sur l'efficacité des outils digitaux à transformer la manière dans les entreprises algériennes perçoivent et pratiquent la gouvernance.

Cette dynamique est bien illustrée dans le cas de l'entreprise CASA Médical, spécialisée dans les domaines de la physiothérapie et de la médecine esthétique. Grâce à l'adoption progressive des solutions digitales : ERP, plateformes de communication, cloud computing, ...l'entreprise a réussi à mieux gérer ses flux informationnels, dynamiser ses processus de contrôle interne et à instaurer un climat de confiance entre les parties prenantesCependant, des défis importants subsistent, notamment en matière de :

- Formation des cadres,
- Adaptation culturelle au digital
- Sécurisation des données.

Néanmoins, ladigitalisation n'est pas une solution en soi, mais un levier conditionnel, dont l'efficacité dépond :

- du degré d'intégration stratégique
- des compétences digitales des acteurs
- et des conditions organisationnelles propres à chaque entreprise

Cette étude encourage à examiner plus en profondeur les nouvelles formes de gouvernance digitale en Algérie, en combinant des méthodes qualitatives et quantitatives pour une validation empirique à plus grande échelle.

Enquête dans le cadre d'une recherche scientifique

Chère Madame, Cher Monsieur,

Dans le cadre de l'élaboration d'un article scientifique, nous entreprenons une recherche portant sur le thème : « **La digitalisation comme outil de dynamisation de la gouvernance d'entreprise dans un contexte Algérien** »

Ce guide d'entretien constitue l'un des volets les plus importants de cette recherche, il a pour but d'étudier et d'analyser les opinions des principaux acteurs de la gouvernance d'entreprise sur **le rôle joué par la digitalisation dans l'amélioration de la gouvernance d'entreprise** à travers la réduction de l'asymétrie de l'information entre partie prenantes, l'atténuation de l'opportunisme et le contrôle de l'enracinement.

Nous vous prions de bien vouloir répondre à cette enquête, Nous nous engageons à assurer l'anonymat de vos réponses, car toutes les informations que vous donnez seront traitées uniquement à des fins statistiques et dans le cadre de cette recherche universitaire. Votre collaboration favorisera la recherche scientifique en Algérie et aidera à montrer l'apport de la digitalisation à la gouvernance d'entreprise.

Nous vous remercions d'avance pour votre précieuse compréhension

- Comment la digitalisation a-t-elle changé la manière dont l'information est partagée au sein de votre organisation ?
- Dans quelle mesure la digitalisation a-t-elle contribué à réduire l'asymétrie de l'information dans votre domaine ?
- Quels sont, selon vous, les principaux risques d'opportunisme auxquels une entreprise peut être confrontée de la part de ses dirigeants ?
- Dans quelle mesure pensez-vous que la digitalisation peut contribuer à atténuer ces risques d'opportunisme ?
- Avez- vous des exemples ou des cas où la digitalisation a été utilisée avec succès pour détecter ou prévenir des comportements opportunistes de la part des dirigeants ?
- Comment la digitalisation a-t-elle modifié la nature ou l'ampleur des conflits d'agence dans votre entreprisse ?
- Pensez-vous que certains outils ou pratiques numériques spécifiques peuvent aider à résoudre ou à prévenir les conflits d'agence ? Si oui ? Lesquels ?

Nous arrivons à la fin de cet entretien. Avez-vous d'autres commentaires ou points que vous aimeriez ajouter concernant la digitalisation et la gouvernance d'entreprise en Algérie ?

Keywords Digital governance, dimensions of digital governance, sustainable development, dimensions of sustainable development

Abstract

The study aims to determine the impact of the dimensions of digital governance (digital participation, digital transparency, digital accountability, digital auditing) on the dimensions of sustainable development. The descriptive-analytical method was adopted, and the study model was constructed based on theoretical and field studies—both Arab and foreign—related to the study's topic. A case study was conducted in the fieldwork segment by selecting Condor Electronics in Algeria. A questionnaire was specifically prepared for this purpose and distributed to a sample of 70 employees. The data collected were statistically analyzed and processed using the statistical program (SPSS, v27).

The study reached several conclusions, the most notable of which is the existence of an effect of digital governance dimensions on the dimensions of sustainable development as a whole. The study also recommended the necessity of recognizing the importance of implementing digital governance, as it can influence the achievement of sustainable development dimensions.

1 Introduction

Progress toward enhancing the dimensions and objectives of sustainable development constitutes a complex challenge at the national level, given its integrated, interconnected, and intergenerational nature. This necessitates that governments rethink their organization, structure, and methods of operation. However, in practical application, governments face significant obstacles in overcoming traditional approaches, which have effectively failed to meet the demands of development and sustainability. This has led to the need to intensify efforts in search of a more suitable new approach.

Achieving the Sustainable Development Goals (SDGs) by 2030 requires a comprehensive transformation in how governments address the increasing challenges of development. It calls for rethinking the role of governments in the digital era and how they interact with society and the private sector. This must include their ability, in the context of digital transformation, to manage public affairs and respond effectively and seriously to the needs of their communities, as well as how to deliver services and manage development and the economy in a sustainable manner.

Digital governance is one of the responses to the digital transformation witnessed by institutions and organizations in the modern era. The importance of digital data and information has increased in communication and transactions, and digital government approaches now have the potential to accelerate the achievement of sustainable development goals and ensure that no one is left behind.

Problem Statement:

Accordingly, we pose the following research problem:

Does digital governance contribute to achieving the dimensions of sustainable development?

Research Hypotheses:

To answer the problem and achieve the study's objectives, the following main hypothesis was formulated:

There is no statistically significant effect of the dimensions of digital governance in promoting the dimensions of sustainable development at Condor Electronics at a significance level of ($\alpha \leq 0.05$).

Study Objectives:

The primary aim of this study is to highlight the contribution of the dimensions of digital governance in achieving the dimensions of sustainable development by confirming or refuting this effect.

This main objective branches into several sub-objectives, including:

- Providing a theoretical framework defining the concepts of digital governance and sustainable development, along with their respective dimensions.
- Attempting to identify the effect of implementing digital governance on achieving the dimensions of sustainable development in the institution under study.
- Attempting to present recommendations and suggestions based on the study's results to help highlight the impact of digital governance dimensions in achieving sustainable development dimensions.

2 A Knowledge-Based Introduction to Digital Governance

2.1 The Concept of Digital Governance

Before discussing digital governance, it is important to understand that the term consists of two components. We must first define the term governance, which is defined as:

"The exercise of political, economic, and administrative authority in managing the affairs of the state at all levels. Governance represents the mechanisms, processes, relationships, and institutions through which individuals and groups can express their interests, exercise their rights, fulfill their obligations, and resolve their differences: (smail, 2007). "

As for digitalization, it refers to the application of modern technology to achieve transparency, enable traceability of value chains, and serve customers and society in a more responsible and sustainable way, while making decisions based on data.

Accordingly, the concept of digital governance can be defined as: The use of information and communication technology (ICT) by public sectors to improve the delivery of information and services, encourage citizen participation in decision-making processes, and enhance the effectiveness, accountability, and transparency of government. (Ayachi, 2015)

It is also defined as: A system for control, oversight, and decision-making within the context of digital technology and information, aimed at directing and supervising the use of digital technology, achieving institutional objectives, enhancing transparency and accountability, reducing risks, and ensuring legal compliance. (Haja, 2023)

2.2 The Importance of Digital Governance:

The main benefits of digital governance can be summarized as follows: (Belkacem Boufateh, 2021)

- **Speed:** Digital governance facilitates task completion in a short time. Smartphones and online services enable the instant transfer of large volumes of data globally, which means that digital governance can accelerate service delivery and allow businesses and individuals to access information more quickly than in the past.
- **Cost Reduction:** Digital governance helps reduce expenses. Traditional methods involving written messages, paper records, and manual processes consume significant time, effort, and money. Replacing these with information technology and internet-based solutions can save substantial costs.
- **Transparency:** It contributes to making all business functions more transparent and clear. Transparency also allows citizens to access any information they need, whenever they want, with a simple click or touch.
- **Enhanced Communication:** Implementing digital governance can strengthen communication between the government and the business sector. This especially benefits entrepreneurs and startups, as it enables them to communicate effectively and compete with large corporations for investments or contracts. In this way, digital governance helps reduce monopolies and creates space for everyone.
- **Trust Building:** Digital governance helps build trust between governments and citizens, which is a key factor in good governance. It seeks to use strategies based on technology and the internet to engage citizens in general.
- **Operational Efficiency:** Digital governance aims to enhance overall operational efficiency. By using modern technologies, tasks and services can be executed more quickly and effectively, saving time and effort, which can then be redirected toward more beneficial activities.
- **Corruption Reduction:** One of the hallmarks of the digital age is the dominance of visibility, where everything is accessible and known to all. This means that corruption has fewer places to hide.
- **Accountability:** A natural consequence of transparency is accountability. Governments can be held accountable when mistakes are made. Digital governance indirectly improves performance, as the awareness that government actions are under public scrutiny pushes for continuous improvement.

2.3 Dimensions of Digital Governance

Several scholars and researchers agree on the key dimensions of digital governance, each of which is defined as follows: (Ahed Abdelkader Abu Ata, 2023)

- **Digital Participation:** This refers to enabling all stakeholders and concerned parties to participate in decision-making processes and express their opinions. It is achieved by facilitating access to information through the use of information and communication technology (ICT), allowing them to present their ideas and suggestions.
- **Digital Transparency:** This means clarity without ambiguity, allowing the public and stakeholders to know the truth without concealment or deception. It involves the institution's commitment to openly sharing and disclosing information about its activities and operations through ICT tools and modern technologies.
- **Digital Accountability:** This is the mechanism through which individuals and organizations are held responsible for actions and decisions related to the use of digital technologies and data. It assures stakeholders that activities are being conducted in the public interest.
- **Digital Auditing:** This refers to the activity of verifying that the organization's processes are aligned with established standards. Effective auditing requires active participation from stakeholders and uses modern information and communication technologies to obtain information quickly, with minimal effort and cost.

3. The Conceptual Framework of Sustainable Development

3.1 The Concept of Sustainable Development:

The concept of sustainable development has been defined in various ways by different researchers and authors. Among the most cited definitions:

Sustainable development is defined as *development that meets the needs of the present generations while preserving the future and the needs of coming generations, taking into account the protection of the environment and natural resource.* (P. Widloecher, 2009)

The World Bank defines sustainable development as: *"A process concerned with achieving intergenerational equity, ensuring that future generations have access to the same developmental opportunities as current ones, by maintaining or increasing overall capital over time."* (Al-Buraid, 2015)

Considering the numerous definitions, it is clear that sustainable development spans several domains. A report issued by the World Resources Institute (WRI)—a U.S.-based organization concerned with promoting sustainability—summarized ten widely used definitions of sustainable development and classified them into four categories: economic, social, environmental, and technological. These are summarized as follows. (Abdelghani, 2012–2013):

- **Economic Perspective:** In developed countries, sustainable development implies reducing energy and resource consumption. In developing countries, it involves mobilizing resources to raise living standards and reduce poverty.
- **Social and Human Perspective:** It involves striving for population growth stabilization and improving healthcare and educational services, particularly in rural areas.
- **Environmental Perspective:** It refers to the protection of natural resources and the optimal use of agricultural land and water resources.
- **Technological Perspective:** It involves transitioning society toward clean industries that use environmentally friendly technologies, minimize the emission of harmful gases, and reduce substances that damage the ozone layer and contribute to global warming.

3.2 Goals for Sustainable Development As stated in the United Nations 2030 Agenda

Adopted under the resolution "Transforming our world: the 2030 Agenda for Sustainable Development," the 2030 Agenda for Sustainable Development came out of the 70th session of the United Nations General Assembly in 2015.

As it lays a thorough action plan for people, the earth, and prosperity, this agenda reflects the most aspirational global agreement the United Nations has ever attained.

Defined as seventeen (17) Sustainable Development Goals (SDGs), these developmental goals—or global challenges—were compiled as follows to "save the world" (Nations, 2024) :

Goal 01- No Poverty: Finish poverty in all its manifestations wherever.

Goal 02- Zero Hunger: Finish hunger, attain food security and better nutrition, and support environmentally friendly farming.

Goal 03- Promote well-being for all at all ages and guarantee healthy life by means of this.

Goal 04- Guarantee inclusive and fair quality education as well as encouragement of lifelong learning possibilities for all.

Goal 05- Aim for gender equality and empower every female and girl.

Goal 06- Sanitation and Clean Water: Verify availability and sustainable management of water and sanitation for everyone.

Goal 07- Guarantee of affordable, dependable, sustainable, modern energy for all depends on ensuring access to these.

Goal 08- Promote steady, inclusive, sustainable economic growth, full and productive employment, and good work for all by means of decent work and economic development.

Goal 09- Industry, Innovation and Infrastructure: Create strong infrastructure, advance inclusive and sustainable industrialization, and encourage invention.

Goal 10- Reducing inequalities both inside and between nations

Goal 11- Make cities and human communities inclusive, safe, strong, and sustainable by design.

Goal 12- Promote sustainable consumption and production to guarantee such trends.

Goal 13- Acknowledging current agreements under the UNFCCC, take quick action to counteract climate change and its effects.

Goal 14- Sustainable development depends on the oceans, seas, and marine resources being conserved and used sustainably.

Goal 15- Manage forests sustainably, fight desertification, stop and reverse land degradation, protect, restore, and promote sustainable use of terrestrial ecosystems, so halting the loss of biodiversity.

Goal 16 - Promote peaceful and inclusive societies for sustainable development, give access to justice for all, and establish strong, responsible, and inclusive institutions.

Goal 17- Strengthen the tools of implementation and revive the worldwide cooperation for sustainable development by means of partnerships for the goals.

Figure showing the seventeen (17) Sustainable Development Goals follows:

Figure 1. The 17 Sustainable Development Goals – 2030 Agenda

1 NO POVERTY
2 ZERO HUNGER
3 GOOD HEALTH AND WELL-BEING
4 QUALITY EDUCATION
5 GENDER EQUALITY
6 CLEAN WATER AND SANITATION
7 AFFORDABLE AND CLEAN ENERGY
8 DECENT WORK AND ECONOMIC GROWTH
9 INDUSTRY, INNOVATION AND INFRASTRUCTURE
10 REDUCED INEQUALITIES
11 SUSTAINABLE CITIES AND COMMUNITIES
12 RESPONSIBLE CONSUMPTION AND PRODUCTION
13 CLIMATE ACTION
14 LIFE BELOW WATER
15 LIFE ON LAND
16 PEACE, JUSTICE AND STRONG INSTITUTIONS
17 PARTNERSHIPS FOR THE GOALS
SUSTAINABLE DEVELOPMENT GOALS

4. Digital Governance as One of the Pillars for Promoting the 2030 Sustainable Development Goals

4.1 Digitalization as a Means to Achieve the 2030 Agenda and Sustainable Development Goals

Digitalization and Information and Communication Technologies (ICT) play an undeniable role in accelerating progress in the implementation of the United Nations' seventeen Sustainable Development Goals (SDGs), given their positive contribution to reducing transaction costs, improving service delivery, diversifying revenue sources, and preserving and sustaining natural resources.

The United Nations has promoted an expanded vision of digitalization and the digital economy as enabling factors relevant to achieving the SDGs. The international organization also identified science, technology, and innovation—alongside development financing—as one of the two main means of implementation for achieving the SDGs by 2030.

Among the clear examples of the impact of digitalization on economic and social development in developing countries are mobile payment systems, which provide easy access to financial services for poor and marginalized populations. In India, innovations such as the *Unified Payments Interface* have successfully facilitated the integration of the poor into the digital economy.

Therefore, technology, knowledge, and the digital economy contribute to achieving the Sustainable Development Goals and can support the implementation of each of the seventeen SDGs, including healthcare, agriculture, poverty and hunger reduction, the creation of new jobs, mitigation of climate change effects, improvement of energy consumption efficiency, and making cities and communities more sustainable. (Mahmoud, 2022).

Among the Sustainable Development Goals for 2030, there are four main goals—specifically Goal 4, Goal 5, Goal 9, and Goal 17—that directly focus on the central role of digitalization and ICT in achieving sustainable development.

Below is a table illustrating these goals that are directly related to digitalization and information and communication technologies:

Board 1. Key Sustainable Development Goals Related to Digitalization and Information Technology

Goal	Target
Goal 4: Quality Education	Target 4.b: A significant rise in the number of scholarships available to developing nations for higher education, especially to least developed countries, small island developing States, African countries including vocational training and programs in technical, engineering, and scientific fields in developed countries and other developing countries.
Goal 5: Gender Equality	Target 5.b: Improve the use of enabling technology—in particular, information and communications technology—to help to empower women.

Goal 9: Industry, Innovation and Infrastructure	Target 9.c: Try to give least developed nations universal and reasonably priced access to the Internet and greatly expand access to information and communications technology.
Goal 17: Partnerships for the Goals	Target 17.8: By 2017 completely operationalize the technological bank and innovation, science, and technology building capacity mechanism for the least developed countries; also improve the implementation of enabling technology, especially technology for communication and information.

Source: (Velden, 2018)

4.2 Digital Governance and the 2030 Sustainable Development Goals

Digital governance represents a fundamental transformation in the ways governments conduct their affairs, aiming to keep pace with the tremendous advancements led by the private sector in the field of electronic services—delivering services and completing a large volume of transactions with clients via computers and the internet. Many countries have come to realize the importance of digital governance for sustainable development, as its primary objective is essentially the achievement of human development. Contemporary development thought presents human development as an entry point for sustainable development, which draws its sustainability from developing all individuals' capacities and empowering them to utilize and expand their potential.

The concept of sustainable development does not view the individual merely as a resource, a labor force, or a production factor, but rather as a moral being with the capacity for creativity and participation in community life. Implementing digital governance will lead to directing and managing economic and social development efforts, improving core social services such as healthcare and education, and building the necessary social and economic infrastructure for launching development processes and ensuring their sustainability. (S Maimouna Rezoug, 2023).

Governments, in collaboration with the private sector and civil society, will play a central role in implementing the 2030 Sustainable Development Goals. They must work to realize the principles and objectives of the agenda across public institutions at the local, national, regional, and international levels. This specifically means ensuring that the goals of eradicating poverty and "leaving no one behind" guide all institutions, social influencers, public policies, and services provided to the public.

Today, digital government is considered a powerful developmental tool capable of applying all guiding principles for achieving the SDGs, by building societies that uphold peace, justice, and fairness for all. This can only happen through the presence of effective and accountable institutions that respond to everyone's needs. Capacity-building and innovation stimulation will be necessary at all levels—particularly in the fields of ICT and digital governance—to promote policy integration, improve public institutional accountability, and implement digital participation for more inclusive communities. This ensures that public services are delivered equitably and efficiently to all, especially to the poorest and most vulnerable groups (Aquaro, 2024).

Undoubtedly, focusing on digital governance—by encouraging the use of communication technologies and information systems—can enhance economic growth and sustainable development, positively impacting the development of the social environment by enabling humans to control nature and achieve productive efficiency. Sustainable development does not view humans as mere resources, but as ethical beings with the power of innovation and positive participation in utilizing their environment.

The application of digital governance helps consolidate the principles of good governance, which are based on equality, justice, rule of law, and participation. It also contributes to combating financial and administrative corruption, bribery, and other negative social phenomena. Moreover, it improves and simplifies the quality of services provided by allowing access through a single portal, establishing networks and systems connecting various government bodies, and providing the IT infrastructure necessary as a foundational pillar for achieving economic development. This is clearly seen in developed countries that have achieved significant economic growth by adopting digital governance, with Singapore being a prime example of this approach (Sahnouni Mostafa, 2021)

5. Field Study

5.1 Introduction to the Institution Under Study

Condor Company is an Algerian enterprise specialized in the manufacturing of electronic and electrical devices. It is considered one of the leading companies in this field in Algeria and the region. Condor was established in 2002 and operates under the Benhamadi Group. Its share capital is estimated at 4,277,000,000 DZD. In addition to producing a wide range of electronic products, the company also has six productive business units, which are as follows:

- Refrigerator Business Unit
- Cooking Appliances and Metal Processing Business Unit

- Air Conditioning, Heating, and Laundry Business Unit
- Plastic Processing Business Unit
- Polystyrene Business Unit
- Solar Energy and Lighting Business Unit

As of December 31, 2022, the company employs approximately 3,814 workers, including 3,544 males and 270 females, distributed across all of the company's production units according to the needs of each department.

5.2 Study Methodology

In order to cover the various theoretical and practical aspects of the subject, answer the research question, and test the validity of the hypothesis, the researcher relied on the descriptive-analytical approach to address and define the different intellectual and conceptual dimensions related to the study topic. This approach aimed to comprehensively understand the topic and analyze the components on which it is based. For the applied part of the study, a questionnaire was used as the data collection tool, and the data was analyzed statistically using the SPSS software.

5.3 Study Sample

Selecting an appropriate study sample is of great importance in scientific research, especially in terms of its impact on the study and its results, as a well-chosen sample can accurately represent the broader population. The study targeted individuals who are almost permanently present within the company's main units and administrative structures—specifically, experienced and qualified executives and employees with extensive knowledge of information and data related to the company. The focus was placed on this group because they are consistently present within the company's operational environment.

5.4 Study Tool

The present study relied on the questionnaire as the primary tool for collecting the necessary data, specifically designed for this purpose. The questionnaire is considered one of the most suitable and appropriate tools for the nature of this study. It was developed based on several previous Arab and international studies and was divided into the following sections:

- **Section One:** Pertains to the personal data of the sample members, including (gender, age, academic qualification, job position, and years of experience).
- **Section Two:** Pertains to the independent variable of the study, which is the dimensions of digital governance (digital participation, digital transparency, digital accountability, digital auditing).
- **Section Three:** Pertains to the dependent variable of the study, which is the dimensions of sustainable development (economic, social, environmental, and technological dimensions).

The five-point Likert scale guided the formulation of the questions; the scores shown in the following table reflect this distribution:

Table 2. Arithmetic Mean Values and Availability Degree According to the Five-Point Likert Scale

Reference Mean	4.21 – 5	3.41 – 4.20	2.61 – 3.40	1.81 – 2.60	1 – 1.80
Weight	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
Evaluation	High		Medium	Low	

Source: Prepared by the researcher based on previous studies.

5.5 Validity and Reliability

5.5.1 Construct Validity

The calculation of the Pearson correlation coefficient among the total score of every dimension inside a section and the total score of the section as a whole, the researcher performed a construct validity test for the study tool. It follows that the questionnaire has great construct validity if the correlation coefficient is strong and statistically significant.

Table 3. Construct Validity Test of the Questionnaire

Correlation Relationship		Correlation Coefficient (r)	Significance Level
Digital Governance Axis	Digital Participation Dimension	0.74	0
	Digital Transparency Dimension	0.75	0
	Digital Accountability Dimension	0.75	0
	Digital Auditing Dimension	0.82	0
Sustainable Development Axis	Economic Dimension	0.92	0
	Social Dimension	0.92	0
	Environmental Dimension	0.93	0

	Technological Dimension	0.94	0

Source: Made by the researcher using SPSS v27 outputs.

From Table (03), it is evident that all correlation coefficients are statistically significant, ranging between 0.74 and 0.94, indicating a strong and positive correlation between the overall Digital Governance section and its four dimensions, as well as between the Sustainable Development section and its four dimensions. Therefore, the questionnaire demonstrates high construct validity and is indeed suitable for measuring what it was designed to measure.

5.5.2 Instrument Reliability

The reliability and stability associated with the measurement—that is, the results the questionnaire should produce when used on the same sample under the same conditions—define its dependability. Using the Cronbach's Alpha coefficient helped one evaluate the dependability of the instrument. This coefficient runs from 0 to 1; the lowest permissible value is 0.7.

Table 4. Cronbach's Alpha Coefficients for Measuring Instrument Reliability

Axis	Number of paragraphs	Reliability (Cronbach's Alpha)
Digital Participation	5	0.913
Digital Transparency	5	0.868
Digital Accountability	5	0.87
Digital Auditing	5	0.896
Axis One: Dimensions of Digital Governance	**20**	**0.923**
Economic Dimension	5	0.941
Social Dimension	5	0.897
Environmental Dimension	5	0.915
Technological Dimension	5	0.953
Axis Two: Dimensions of Sustainable Development	**20**	**0.973**
Total Questionnaire	**40**	**0.955**

Source: Made by the researcher using SPSS v27 outputs.

With Table (04) the Cronbach's Alpha value for the whole questionnaire is 0.955, which is regarded as rather high. Moreover, respectively, the Cronbach's Alpha values for the two main questionnaire sections are 0.923 and 0.973. The Alpha values for the four dimensions of digital governance fell between 0.868 and 0.913; for the four dimensions of sustainable development, the values fell between 0.897 and 0.953.

These findings show that the questionnaire is rather dependable and can be boldly applied in the field of the research.

5.6 Analysis of Sample Characteristics

The characteristics and traits of the study's sample units can be described as follows:

5.6.1 Distribution of Sample Members by Gender Variable:

The following table shows the distribution of the study sample according to gender:

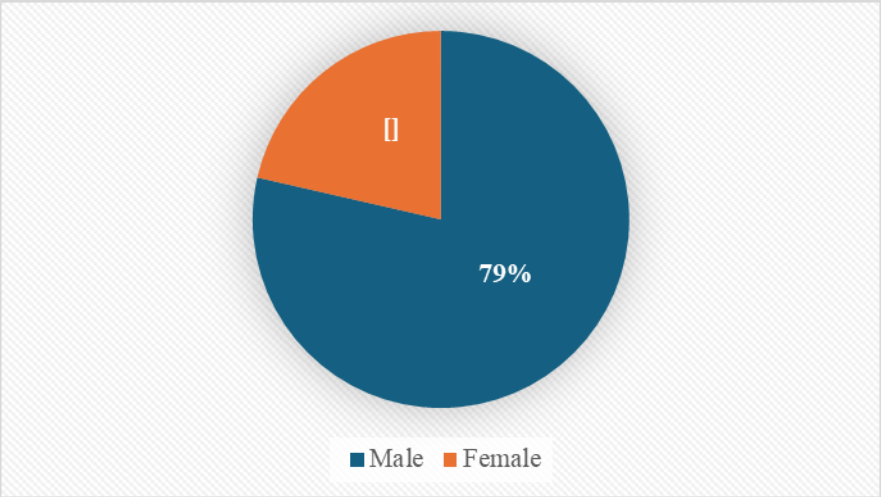
Table 5. Distribution of Study Sample by Gender Variable

Variable	Frequency	Percentage
Male	55	78.60%
Female	15	21.40%
Total	70	100%

Source: Prepared by the student based on SPSS v27 outputs.

The following figure illustrates the distribution of the study sample by gender:

Figure 2. Distribution of Study Sample by Gender Variable



Source: Made by the researcher using company data.

From the above table and figure, it is observed that the majority of the sample consists of males, representing 78.6%, while 21.4% of the sample are females. This indicates a degree of diversity within the study sample.

It also suggests that most workers in the institution under study are male. This can be explained by the nature of the company's activities, which primarily involve the production and assembly of household electrical and electronic appliances. These activities are sometimes physically demanding, involve long working hours, and include technical, service, and professional roles that are generally more suitable for men and require physical effort—unlike roles typically filled by women.

5.6.2 Distribution of Sample Members by Age Variable:

The following table presents the distribution of the study sample according to the age variable:

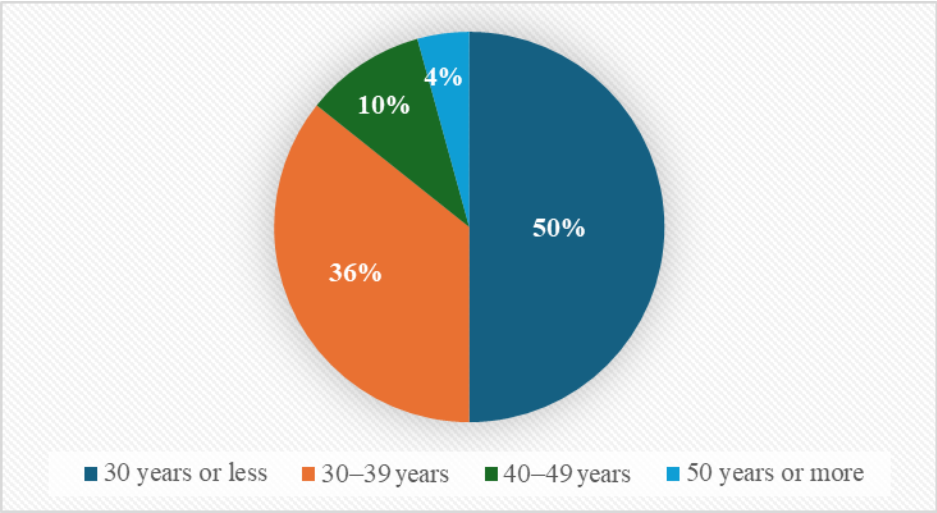
Table 6. Distribution of Study Sample by Age

	Variable	Frequency	Percentage
Age	30 years or less	35	50%
	30–39 years	25	35.70%
	40–49 years	7	10%
	50 years or more	3	4.30%
	Total	70	100%

Source: Prepared by the student based on SPSS v27 outputs.

The following figure shows the distribution of the study sample by age:

Figure 3. Distribution of Study Sample by Age



Source: Made by the researcher using company data.

From the table and figure above, it is observed that the majority of the sample members are under 30 years old, with a representation rate of 50%. This is followed by the age group 30–39 years, representing 35.7% of the sample.

In third place is the 40–49 years age group, with a representation of 10%, and finally, the 50+ years category comes last, with a representation of 4.3%.

This indicates that most employees are young, which reflects the general economic trend of investing in young talent capable of adding value to the institution. The aim is to benefit from dynamic, creative, and development-oriented youth competencies.

These results can also be interpreted to mean that the institution seeks to combine youth with experience, encouraging interaction between different age groups. This approach contributes positively to balanced performance, knowledge transfer, and the formation of a generation capable of taking leadership in the future.

5.6.3 Distribution of Sample Members by Educational Qualification

The following table presents the distribution of the study sample according to the educational qualification variable:

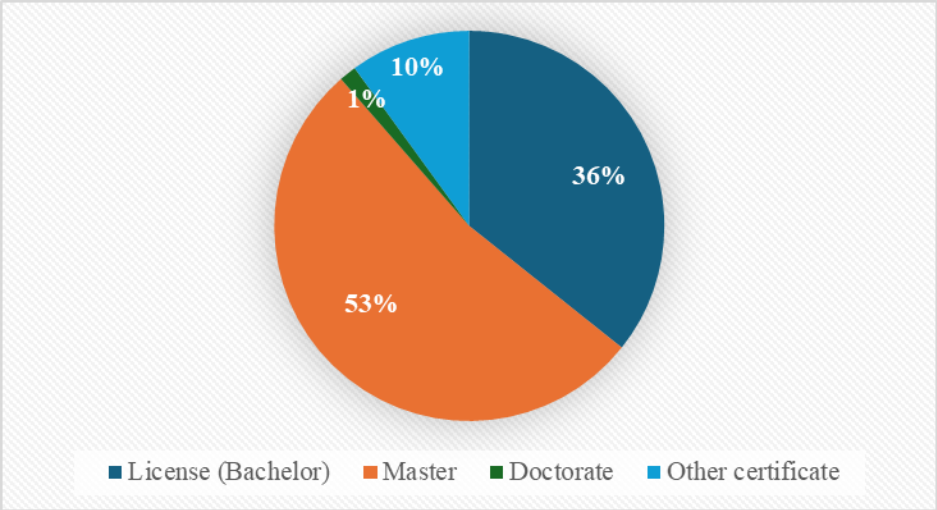
Table 7. Distribution of Study Sample by Educational Qualification

Statement	Variable	Frequency	Percentage
Academic Degree	License (Bachelor)	25	35.71%
	Master	37	52.86%
	Doctorate	1	1.43%
	Other certificate	7	10%
	Total	70	100%

Source: Prepared by the student based on SPSS v27 outputs.

The following figure shows the distribution of the study sample by educational qualification:

Figure 4. Distribution of Study Sample by Educational Qualification



Source: Made by the researcher using company data.

From the above table and figure, we observe that the majority of the sample consists of individuals holding a Master's degree, representing 52.86% of the sample. They are followed by those with a Bachelor's degree (Licence) at 35.71%. At the bottom of the ranking are those with a PhD, representing 1.43%, while 10% of the sample hold other qualifications.

This reflects a recruitment policy focused on attracting and employing university-level talent with high levels of knowledge and strong capabilities for learning and continuous development. This is consistent with the nature of jobs and activities within the company, especially given its strong connection to modern technology and digital transformation.

5.6.4 Distribution of Sample Members by Job Position:

The following table presents the distribution of the study sample according to the job position variable:

Table 8. Distribution of Study Sample by Job Position

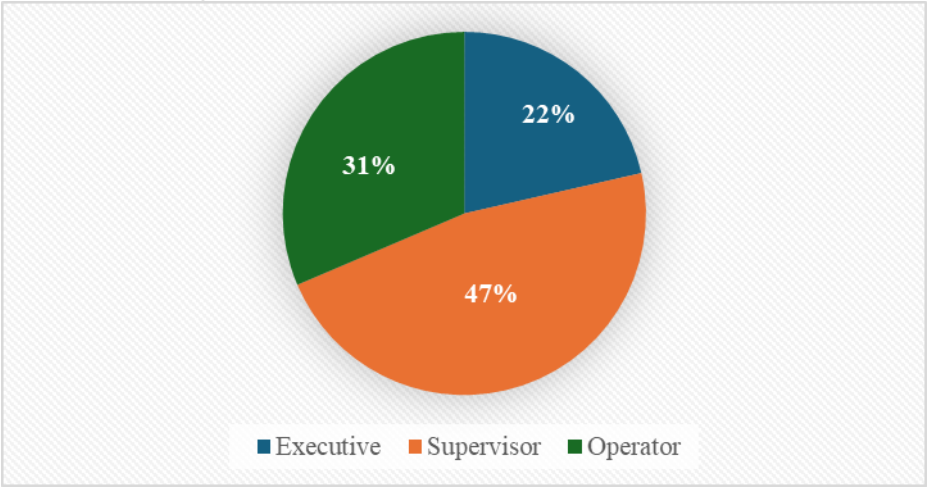
Statement	Variable	Frequency	Percentage
Job Position	Executive	15	21.43%

	Supervisor	33	47.14%
	Operator	22	31.43%
	Total	70	100%

Source: Prepared by the student based on SPSS v27 outputs.

The following figure shows the distribution of the study sample by job position:

Figure 5. Distribution of Study Sample by Job Position



Source: Made by the researcher using company data.

From the table and figure above, it is observed that the majority of the sample consists of skilled support staff (Agents de maîtrise), representing 47.14% of the total. They are followed by operational agents (Agents d'exécution) at 31.43%, and finally, executive-level employees (Cadres) represent 21.43%.

These proportions reflect a balanced organizational structure, where roles and responsibilities are distributed in a manner that supports efficient functioning across various levels of the institution.

5.6.5 Distribution of Sample Members by Professional Experience

The following table presents the distribution of the study sample according to the professional experience variable:

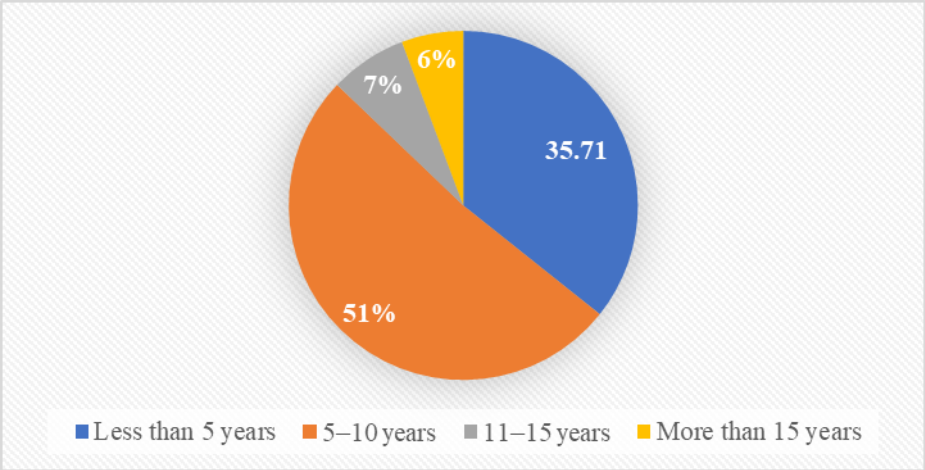
Table 9. Distribution of Study Sample by Professional Experience

Statement	Variable	Frequency	Percentage
Professional Experience	Less than 5 years	25	35.71%
	5–10 years	36	51.43%
	11–15 years	5	7.14%
	More than 15 years	4	5.72%
	Total	70	100%

Source: Prepared by the student based on SPSS v27 outputs.

The following figure shows the distribution of the study sample by professional experience:

Figure 6. Distribution of Study Sample by Professional Experience



Source: Made by the researcher using company data.

From the table and figure above, it is evident that the majority of the sample consists of employees with 5 to 10 years of experience, representing 51.43% of the sample. They are followed by those with less than 5 years of experience, representing 35.71%, then those with 11 to 15 years of experience at 7.14%, and finally, those with more than 15 years of experience, representing 5.72%.

This distribution reflects a healthy mix of varying levels of experience, indicating that the institution values its staff and fosters employment stability. It also demonstrates the employees' responsibility and accumulated experience, which positively impacts the institution's management and operational efficiency.

5.7 Analysis of the Results of the Questionnaire Axis and Dimensions

5.7.1 Analysis of the Results of the Digital Governance Dimensions Axis

The results concerning the dimensions of the digital governance axis are summarized in the table that follows:

Table 10. The Digital Governance Axis Dimensions: Means and Standard Deviations Calculated

Dimension	Mean	Std. Deviation	Direction	Overall Level
Digital Participation	4.07	0.63	Agree	High
Digital Transparency	4.15	0.46	Agree	High
Digital Accountability	3.98	0.55	Agree	High
Digital Auditing	4.14	0.51	Agree	High
Digital Governance Dimensions	4.08	0.46	Agree	High

Source: Made by the researcher using SPSS v27 outputs

Based on the respondents' answers to the axis questions shown in the table above, it was found that the digital governance dimensions axis received an "Agree" rating, with an arithmetic mean of 4.08 and a standard deviation of 0.46.

The four dimensions—digital participation, digital transparency, digital accountability, and digital auditing—also received an "Agree" rating, with arithmetic means of 4.07, 4.15, 3.98, and 4.14, and standard deviations of 0.63, 0.46, 0.55, and 0.51, respectively.

5.7.2 Analysis of the Results of the Sustainable Development Dimensions Axis

The following table presents a summary of the results related to the dimensions of the sustainable development axis:

Table 11. The Sustainable Development Axis Dimensions: Means and Standard Deviations Calculated

Dimension	Mean	Std. Deviation	Direction	Overall Level
Economic Dimension	3.95	0.78	Agree	High
Social Dimension	3.79	0.72	Agree	High
Environmental Dimension	3.71	0.75	Agree	High
Technological Dimension	3.96	0.82	Agree	High
Sustainable Development Dimensions	3.85	0.44	Agree	High

Source: Made by the researcher using SPSS v27 outputs

Based on the respondents' answers shown in Table (11) above, the sustainable development dimensions axis recorded an arithmetic mean of 3.85 with a standard deviation of 0.44, indicating an "Agree" response trend.

The arithmetic mean values for the four sustainable development dimensions—economic, social, environmental, and technological—ranged between 3.71 and 3.96, with standard deviations between 0.72 and 0.82, also reflecting an Agree trend.

This indicates that the targeted sample unanimously agrees on the presence of sustainable development dimensions within the institution.

5.8 Testing the Study Hypotheses

This section involves testing the main hypothesis of the study along with the four sub-hypotheses. It allows us to determine whether these hypotheses can be confirmed or rejected. To analyze the hypotheses, we used the **multiple linear regression model**, which is appropriate for this study. The model is represented as:

$$Yi = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \ldots + \beta k Xk + ui$$

Where:

- **Yi** represents the dependent variable
- **X_1...Xk** are the values of the independent variables
- **β_0** is the constant term (representing the minimum value of the dependent variable *Y* when the independent variables are zero)
- **β_1...βk** are the regression coefficients
- **β_1** = the slope of the relationship between Y and X_1
- **ui** is the random error term, representing the difference between the actual values of the dependent variable and the values predicted by the model

The following table shows the outcomes of the multiple linear regression study of the digital governance aspects on the dimensions of sustainable development:

Table 12. Findings from a Multiple Linear Regression Study on Digital Governance Factors Along the SDGs

Dependent Variable: Sustainable Development Dimensions	Independent Variables	R^2	F Value	F Sig.	Regression Coefficients	T Value	T Sig.
	Digital Participation	0.437	5.054	0.01	0.388	2.337	0.023
	Digital Transparency				0.389	2.275	0.026
	Digital Accountability				0.12	0.724	0.471
	Digital Auditing				0.365	2.14	0.036

Source: Made by the researcher using SPSS v27 outputs

From Table (12), we find that the coefficient of determination (R^2) is 0.437, meaning that the effect of the sub-dimensions of digital governance can be ascribed to 43.7% of the variance and explanatory changes in the axis of sustainable development. The remaining percentage results from other factors not included into the study model.

The calculated F-value is 5.054 with a significance level of 0.01, which is less than the threshold of 0.05, confirming the statistical significance of the overall effect.

Additionally, the table shows:

- The significance level for the effect of digital participation on sustainable development is 0.023, which is statistically significant ($p < 0.05$), indicating that it affects the sustainable development axis when considered together with the other explanatory variables.
- The significance level for the effect of digital transparency is 0.026, also statistically significant, indicating a similar effect.
- The significance level for digital accountability is 0.471, which is not statistically significant, meaning it does not significantly influence the sustainable development axis in combination with the other variables.
- The significance level for digital auditing is 0.036, which is statistically significant, indicating that it has an impact on the sustainable development axis along with the other explanatory variables.

Accordingly, the multiple linear regression equation is as follows:

$$Y = 1.828 + 0.388X_2 + 0.389X_3 + 0.365X_4 + 0.643$$

Where:

- **0.643** is the random error (ui)
- **β_0 = 1.828** (the constant value)
- **Y** = Sustainable Development Dimensions
- **X_1** = Digital Participation Dimension
- **X_2** = Digital Transparency Dimension
- **X_3** = Digital Accountability Dimension *(not included in the equation due to insignificance)*

– X_4 = DIGITAL AUDITING DIMENSION

6. Study Results

The main hypothesis states:

"There is no statistically significant effect of the dimensions of digital governance in enhancing the dimensions of sustainable development in the institution under study at a significance level ($\alpha \leq 0.05$)."

Based on the results related to the main hypothesis, which concerns the role of digital governance dimensions in enhancing sustainable development dimensions, it is clear that there is a positive correlation between the digital governance dimensions axis and the sustainable development dimensions axis. Looking at the regression coefficients for digital participation, digital transparency, and digital auditing, with impact coefficients of 0.388, 0.389, and 0.365 respectively, all of which are positive, this indicates a positive linear relationship between the two axes. Any variation in the independent variables will lead to a change in the same direction for the dependent variable. This implies that the institution demonstrates a reasonable level of commitment to implementing digital governance dimensions. The obtained results can be interpreted as follows:

– Digital participation in Condor plays a major role in enhancing the sustainable development dimensions. This refers to involving employees, customers, and the local community in digital processes and decision-making, through the use of tools and techniques such as digital platforms, participatory applications, and accessible electronic communication channels. These tools enable stakeholder interaction and encourage engagement in sustainability initiatives that raise awareness and support environmental and social objectives. This confirms that top management strategically prioritizes digital participation, aligning well with the Sustainable Development Goals (SDGs).

– Commitment to digital transparency can have a direct effect on the institution's reputation, both locally and internationally. Transparent institutions enjoy a better market reputation. This aligns with SDG 16: "Peace, Justice, and Strong Institutions", which supports just, inclusive, and strong institutions. Condor has adopted clear policies and procedures for publishing information transparently, and it utilizes modern and advanced technologies for data management to ensure information credibility and data quality.

– There is an effect of digital auditing in reinforcing the sustainable development dimensions, attributed to a robust digital infrastructure, top management commitment, and employee training in auditing and management control. This dimension contributes to improved operational efficiency, reduced environmental impact, enhanced transparency, compliance, and risk mitigation. Notably, the quality and competence of external auditors and their use of the latest technologies in their duties further strengthen this effect.

– The digital accountability dimension was weak within Condor. This may be due to an organizational culture that does not place significant emphasis on digital accountability, as well as a lack of awareness among employees and management of its importance in achieving sustainable institutional goals. It also indicates the absence of precise indicators to measure digital accountability outcomes and their impact on operations, alongside a lack of clarity in digital responsibility assessment mechanisms.

This was confirmed by the multiple linear regression equation of the four independent variables and their collective influence on the sustainable development dimensions. The effect of digital participation, digital transparency, and digital auditing was individually significant, meaning these variables are capable of influencing sustainable development dimensions alongside other explanatory variables. On the other hand, digital accountability showed no clear individual impact.

6.1 Study Recommendations

– Condor can further enhance digital participation by developing interactive platforms that enable employees, customers, and stakeholders to actively participate in decision-making and idea-sharing.

– Encourage digital creativity and innovation by launching competitions or initiatives that motivate employees to present innovative ideas using digital tools.

– Work on reinforcing a culture of digital accountability within the institution by organizing employee training workshops on the importance of digital accountability and how to apply it in a digital environment. This includes launching internal awareness campaigns and designing effective digital accountability mechanisms.

– Promote open data publishing as a means to enhance transparency, allowing stakeholders to access information related to the company's performance and strategies.

– Invest in developing technologies like artificial intelligence and big data analytics to increase digital efficiency while upgrading the digital infrastructure of the institution to support several digital dimensions.

– Establish strategic partnerships by collaborating with external entities such as universities, research centers, and international organizations to exchange expertise and best practices in digital transformation and sustainable development.

– To ensure the continuity of success, Condor can strengthen digital auditing by continuously investing in technology, training staff, and integrating digital systems. This includes improving data quality and employing advanced technologies to monitor performance and reduce risks.

7. CONCLUSION

Through the study and analysis, it was found that digital governance is a fundamental tool for promoting sustainable development, as it offers opportunities to improve institutional performance, raise transparency levels, and facilitate data-driven decision-making. The results confirmed a strong relationship between several dimensions of digital governance—such as the use of technology to improve services and enhance community partnerships—and achieving sustainable development dimensions. This includes, for example, promoting social justice, improving education quality, and efficiently utilizing natural resources.

Therefore, it can be concluded that achieving sustainable development through digital governance requires an integrated approach that strengthens impactful dimensions and addresses underperforming ones by providing the necessary support in terms of policies, infrastructure, and human resources. Future research is recommended to delve deeper into understanding the limiting factors affecting certain digital governance dimensions and to work on improving them. In doing so, the full potential of digital governance can be harnessed to advance sustainable development toward a more prosperous and resilient future.

Acknowledgment

The authors express their sincere gratitude to Condor Electronics for their cooperation and for facilitating the fieldwork required for this research. Special thanks are also extended to the Governance Horizons Laboratory for Sustainable Local Development and the Laboratory of the Sustainable Economic Institutions Business Management at the University of El Oued and the University Center of Barika for their institutional and academic support. The authors also appreciate the valuable feedback provided by colleagues and peer reviewers, which contributed to the improvement of this study.

Conflict of Interest

The authors declare that there is no conflict of interest regarding the publication of this article.

Abstract

This study provides a comprehensive examination of Immanuel Kant's philosophy of religion and education, with particular attention to his critical distinction between moral religion and historical religion. Kant's claim that authentic religion must be grounded in morality and reason rather than revelation is explored in depth, alongside his argument that the moral law, embedded within human consciousness, serves as the only valid foundation for faith. By rejecting ritualism, ecclesiastical dogmatism, and external authority, Kant reframes religion as an ethical project centered on moral autonomy and rational duty. The paper also investigates Kant's educational philosophy, which he conceives as a lifelong process of cultivating character, freedom, and the capacity for rational self-legislation. Education, for Kant, is both a moral and practical necessity for guiding humanity toward its highest destiny—progress toward enlightenment and moral perfection. The study situates Kant's thought within the broader intellectual currents of the Enlightenment, emphasizing his enduring influence on modern pedagogy, secular ethics, and debates on the relationship between faith and reason. By reassessing the integration of religion and education in Kant's critical system, this article argues that his philosophy remains a cornerstone for understanding the ethical foundations of religious practice and the transformative aims of education. It also highlights the contemporary relevance of Kant's ideas for discussions on moral education, civic responsibility, and the inseparability of ethical life from both individual autonomy and collective progress.

Introduction:

Religion is regarded as one of the most significant social realities present in all human societies, as no stage in human history, past or present, has known a community devoid of religion. Religion is a fundamentally human phenomenon, fulfilling psychological and social functions indispensable to both the individual and the collective; moreover, it is essential for the continuity of society. Religion is not limited to worship, integrity, and uprightness but encompasses all that contributes to the realisation of good within society. It functions as one of the forms of social organisation that regulate human relationships with one another, as well as their relationships as individuals with metaphysics. Religious responsibility is inherently individual, a fact that has prompted societies to place great emphasis on religious teachings because they influence personal behaviour and their role in shaping groups and subcultures. Religion is thus considered one of the most crucial components of culture. From this premise, the following question may be posed: What is the relationship between religion and education, particularly within the rational and practical framework of Western civilisation?

1. Nature of Religion

Definitions of religion vary from one philosopher to another, each according to his perspective and field of expertise. This diversity arises from the multifaceted nature of religion: on the one hand, it is connected to both the individual and the community; on the other hand, it is linked to the metaphysical realm, which human reason cannot fully comprehend. The diversity of religious manifestations and forms has led to the proliferation of sects and denominations. Religion is also characterised by a sacred quality that grants it exceptional sanctity, rendering it even more enigmatic and making such matters difficult to address. Consequently, metaphysics has been concerned with determining the veracity of religious beliefs and uncovering their truths, whereas the role assigned to religion within society and its influence on social life in all its dimensions fall within the scope of sociology.[1]

Moreover, any attempt to establish a single definition of religion requires us to approach it as being connected to all aspects of humanity, particularly those related to conduct. For this reason, religion is found in every human society, and its presence in life stems from its distinctiveness, unlike other human concerns, in that it is innate, as indicated in the Qurʾānic verse: "So set your face towards religion, inclining to truth. [Adhere to] the nature of God according to which He has created people. Let there be no change in the creation of God. That is the correct religion, but most of the people do not know" (Qurʾān 30:30, Saheeh International). Here, "the nature of God according to which He has created people" refers to that innate awareness, springing from the depths of the soul, that this existence has one God who has control over all things and, by His will, ordains all matter.[2]

This is what we also find in Western thought, particularly with René Descartes, who believed that the human self is marked by deficiency, as evidenced by its awareness of a perfect Being, namely, God. A definition from *Larousse* states, "The religious instinct is shared among all human races, even among those most primitive and closest to animal life. Interest in the divine, or perhaps in what transcends nature, is one of humanity's eternal universal tendencies. This instinct does not vanish; it weakens or fades only in periods of excessive civilisation and then only in a very small number of individuals."[3]

Gustave Le Bon states, "Thanks to beliefs, which sometimes destroy yet more often create, nations and the foundations of true civilisation are established. Without these beliefs, nations cannot survive. From strong belief is born an unshakable conviction, and from such conviction stem the most significant events."[4]

[2] Ibid., 400.
[3] *Larousse*, Paris, vol. 5, 997.
[4] Gustave Le Bon, *al-Ārāʾ wa-l-Muʿtaqadāt* [*Opinions and Beliefs*], 145, cited in: Sulaymān al-Khaṭīb, *Usus Maʿlūm al-Ḥaḍāra fī al-Islām* [*Foundations of the Concept of Civilisation in Islam*], 73.

In view of the diversity and variety of definitions of religion, we have chosen to classify them into three categories:[5]

1. **Definitions Based on Inner Contemplation of Religious Sentiment**

   Among the leading figures of this approach is Herbert Spencer, who said of religion: "It is a sense that we are floating in a sea of mysteries and a belief in a power whose temporal and spatial limits cannot be conceived."

   Max Müller considered religion "an attempt to express the inexpressible and to conceive the inconceivable; it is our awareness of the infinite, our love of God, and our longing for Him as absolute perfection."

   Friedrich Schleiermacher stated that religion is "our sense of absolute need and dependence, and our submission to a Being higher than ourselves."

2. **Definitions Based on Intuition**

   For example, Immanuel Kant defined religion as "the recognition of all our duties as divine commands." Henri Bergson, on the other hand, viewed religion as "a defensive reaction initiated by nature against the dangers that intelligence might introduce disintegration for the individual and dissolution for society."[6]

3. **The Third Category: Definitions Based primarily on Objectivity**

   This category reflects a positivist approach to religion. Proponents of these theories rely on comparative analysis between different religions, ancient and modern, primitive and advanced, living and extinct. We also find that Blaise Pascal (1623–1662) rejected arguments that are detached from the world concerning the existence of God. He considered religion the essential force binding individuals together, regulating their relationships, guiding their conduct, and serving as an effective means of distinguishing between human error and truth, a role he saw embodied in Christianity.[7]

Baruch Spinoza affirmed that religion is one of the necessities of society.

Auguste Comte (1798–1857) held that his "positivist religion" should realise its central principle of universal brotherhood and promote love. Religion, for him, is the instrument through which this love is achieved, and harmony between heart and mind is established. Thus, the mission of religion is to create both spiritual and material bonds among human beings under the motto "Live for others," as a means to overcome individual selfishness and attain an ideal social life.[8]

3. Linguistic definition of religion

Among the linguistic definitions, we refer to that of al-Rāzī, who wrote:

---

[5] Ḥusayn ʿAbd al-Ḥamīd Aḥmad Rashwān, *al-Dīn wa-l-Mujtamaʿ: Dirāsa fī ʿIlm al-Ijtimāʿ al-Dīnī* [*Religion and Society: A Study in the Sociology of Religion*], 8–10.
[6] Ibid., 10.
[7] Ḥusayn ʿAbd al-Ḥamīd Aḥmad Rashwān, *al-Dīn wa-l-Mujtamaʿ: Dirāsa fī ʿIlm al-Ijtimāʿ al-Dīnī* [*Religion and Society: A Study in the Sociology of Religion*], ibid., 12.
[8] Ibid., 13.

"*Tadāyanū*: to engage in transactions on credit; *ista dāna*: to borrow. *Dāyantu fulānan* means I dealt with him, giving him a loan and receiving a loan from him. *Al-dīn* (with kasra) signifies custom, practice, and status. *Dānahu—yadīnu-hu* (with kasra) means that he subdued him and enslaved him, so he became *dān*. In the ḥadīth: *Al-kayyis man dāna nafsahu wa-ʿamila limā baʿda al-mawt* ('The intelligent one is he who subdues his soul and works for what comes after death'). *Al-dīn* also denotes recompense and reward. One says: *dāna yadīnu-hu dīnan* ('he recompensed him'), as in the saying, *kamā tadīn tudān* ('as you deal, so you will be dealt with; as you act, so you will be treated'). In addition, in the verse of the Qurʾān: *A-innā la-madīnun* ('Will we indeed be brought to account?') [Q 37:53], meaning 'We shall certainly be recompensed and held accountable.' From this comes *al-dayyān* as an epithet of God Most High; *al-madīn* meaning 'the servant'; *al-madīna* ('city') for a people subdued by labour, as if governed by authority. *Dānahu* means 'he owned him'; it is said that, from this root, the word *madīna* ('city') is derived. *Al-dīn* also signifies obedience: one says, *dāna lahu yadīnu dīnan*, meaning 'he obeyed him,' and *dayyanahu tadyīnan* ('he entrusted him to his judgement')."[9]

We find numerous meanings for the word "dīn," each of which varies according to its context in speech, ranging from recompense to obedience and other nuances. Ibn Manẓūr, in *Lisān al-ʿArab*, offers further meaning, which may be summarised as follows:

"*Dīn*: *al-Dayyān* is one of the Names of God, Mighty and Majestic, meaning Judge or Arbiter. Some of the early generations, when asked about ʿAlī ibn Abī Ṭālib (peace be upon him), said: *He was the Dayyān of this community after its Prophet*, that is, its judge and ruler. *Al-Dayyān* also means the Subduer, as in the verse by Dhū al-Iṣbaʿ al-ʿAdwānī:

'You, son of ʿUmuk, have gained no precedence in lineage over us, nor are you my Dayyān to subdue me!' meaning: you are not my conqueror, to govern my affairs. *Al-Dayyān* thus signifies God, Mighty and Majestic, the Subduer, Judge, and Arbiter. It is derived from *dāna al-nās*, meaning 'he compelled them to obedience.' One says: *danatuhum fa-dānū* 'I subdued them, so they obeyed.'

Al-Aʿshā al-Ḥaramzī addressed the Prophet (peace and blessings be upon him) in verse:

'O Master of Mankind and Dayyān of the Arabs.'

In a report of Abū Ṭālib, the Prophet (peace be upon him) is quoted as saying: *'I want from Quraysh a word by which the Arabs will tadīn (submit) to them'*, meaning to obey and yield to them.[10]

Dīn also denotes the state or condition. Ibn Sallām said: *Al-dīn al-ḥāl*—'dīn is condition.' An Arab said: *'If you saw me in a dīn other than this,'* meaning 'in a condition other than this.' Thus, *dīn* signifies circumstance and condition, possibly because religion is a purely human affair and a uniquely human state. Religion is a social system; animals have no religion because they lack this system and, as Hegel observed, they cannot rise above the level of sensation to that of thought, nor ascend through reason to the Absolute."

From an Islamic perspective, the statement that animals are "without religion" does not mean that they are devoid of faith, for the Qurʾān states: "And there is not a thing except that it exalts Him with His praise, but you do not understand their way of exalting" (Q 17:44, Saheeh International). Religion is a human concern because prophets are human**;** however, according to the Qurʾān, religion is also addressed to the jinn.[11]

[9] al-Rāzī, *Mukhtār al-Ṣiḥāḥ* [*Selected Lexicon of al-Ṣiḥāḥ*], 91.
[10] Ibn Manẓūr, *Lisān al-ʿArab* [*The Tongue of the Arabs*], vol. 13 (Beirut, Lebanon: Dār Ṣādir), 166–167.
[11] al-Khashshat, Muḥammad ʿUthmān. *Madkhal ilā Falsafat al-Dīn* [*Introduction to the Philosophy of Religion*] (Cairo, Egypt: Dār Qibāʾ li-l-Ṭibāʿa wa-l-Nashr wa-l-Tawzīʿ, 2001), 12.

Thus, religion depicts the human condition within its social framework and clarifies one's status as shaped by faith and religious observance. This quality is what distinguishes humankind from all other creatures.

Al-Jurjānī held that *sharīʿa* (divine law) is called *dīn* insofar as it is obeyed:

"*For the sharīʿa, insofar as it is obeyed, is called dīn; and insofar as it gathers people together, it is called milla (community of faith).*"[12]

The *philosophical dictionary* of Jamil Ṣalībā, in its linguistic treatment of religion, does not depart from what we have outlined above:

"*In Arabic, dīn signifies custom, condition, way of life, policy, opinion, judgement, obedience, and recompense as in the Qurʾānic verse Mālik yawmi al-dīn ('Master of the Day of Recompense,' Q 1:4) and in the proverb kamā tadīn tudān ('As you deal, so will you be dealt with').*"[13]

Referring to André Lalande's *Vocabulaire technique et critique de la philosophie*, we find that the etymology of the word *religion* has been widely debated. Most classical authors (Lactantius, Augustine, Servius) derive it from *religare* ("to bind"), seeing in it the idea of connection, whether the bond of obligation toward certain practices, the bond uniting people to one another, or the bond between humans and deities. Cicero, on the other hand, derives it from *relegere*, meaning "to go over again with care," from *revoir avec soin*. The Latin *religia* initially expressed a feeling of fear and conscientious regard for duty toward the gods. Among the ancients, there was no singular term *religia*; instead, they spoke of *religiones*, denoting "forms of worship." The singular term later came to designate "religion" in general. Thus, the word expresses three principal ideas:[14]

1. The Concept Encompasses:

1. The idea of affirming a theoretical doctrine or a set of intellectual convictions.
2. The idea of a collection of ritual acts of worship.
3. The idea of a direct and spiritual relationship between the human soul and God.

The Terminological Definition of Religion

Religion has been defined in numerous ways within the scholarly literature, including in dictionaries, works of Arabic linguistics, and Islamic writings. Among these is the definition offered by Jamil Ṣalībā in his *Dictionary*:

"Religion, according to our ancient philosophers, is a divine ordinance guiding rational beings towards goodness. The distinction between *dīn*, *milla*, and *madhhab* is as follows: *sharīʿa* (divine law), insofar as it is obeyed, is called *dīn*; insofar as it unites, it is called *milla* (faith community); and insofar as it is a reference point, it is called *madhhab* (school of thought). Another view holds that *dīn* is attributed to God Most High, *milla* to the Prophet, and *madhhab* to the jurist, although these terms are often used interchangeably. Thus, it has been said that they are essentially one but differ in consideration. The term *dīn* is applied to the divine law or the *summa* that is what God has legislated for His servants in terms of laws and ordinances."[15]

Alternatively, it is a divine ordinance that calls upon rational beings to accept what has been brought by the Messenger; or it is a divine decree guiding those endowed with reason, through their own choice, towards goodness in itself; or it is God's true religion, free from doubt, veil, or deviation a disclosure by the Almighty to His servant of His manifest sovereignty, evident in and over all creation, and of His hidden majesty, which no name can fully denote nor form encompass, yet which is the source of all existence.[16]

These definitions converge in articulating the concept of religion, as agreed upon by many scholars concerned with this subject, who concluded that it is a divine ordinance guiding the attainment of goodness. The pursuit of goodness is an essential human aspiration that is sought for the sake of happiness, and it inclines humanity toward peace, tranquillity, and both spiritual and physical well-being, which humans strive and struggle to achieve. Religion, as a heavenly gift for the service of humankind, necessarily fulfils this purpose.

2. Kant's Philosophy of Religion

Kant distinguishes between two kinds of religion: moral religion, which he regards as the one true faith grounded solely in morality, and historical religion (the revealed religion). He discusses historical religion only in relation to moral religion, which is based entirely on pure reason in its practical use. Its laws are a priori independent of any empirical reality or historical events. The person governed by this moral law and moved by it believes in a single God without the need for revelation or proof.

Historical religion, by contrast, is founded upon a transcendent form of knowledge, namely, divine revelation. In this framework, morality is the result rather than the foundation. Kant views all forms of historical religion as having their origins in prophets, who served as the first teachers. Instruction in historical religion does not rest on the concepts and notions of pure reason but rather on knowledge of historical facts, such as revelation and miracles. All historical faith presupposes revelation, and its dissemination depends on the confirmation of its truth. Thus, its legitimate method is rooted in tradition and transmission, whose purpose is to preserve the miracle of revelation and to perpetuate it as sacred commandments taught to humankind so that they become established instructions for every generation.

This faith is therefore grounded in external revelation and requires teachers. Historical faith is a taught faith, wherein religion is presented as dogmatic beliefs accepted through faith rather than subjected to reason, with each belief being offered as a truth taught to all people of every age. To ensure the continuity of revelation as a sacred command for humankind, revelation was accompanied from the outset by miracles. Historical faith holds that evil resides in the human heart and that no one is entirely free from it.[17]

Kant holds that this historical faith lies at the root of the fragmentation of humanity's unity, as competing and conflicting forms of belief view one another as being in error. From this arises conflict, which tears apart the bonds of human unity and strikes at the very foundations of global peace and security. Nevertheless, Kant acknowledges certain advantages to tradition and transmission, such as the promotion of language education, resilience in the face of major anti-religious revolutions, and the preservation of religious continuity.

In historical faith, commitment is characterised by mere compliance and passive obedience to divine revelation. People in this form of belief relate to God as although He was an earthly ruler demanding service and obedience, failing to recognise that in fulfilling their duties toward others, they are also carrying out God's commands. As a result, religion comes to be understood primarily as divine worship rather than as a pure moral obligation. Historical faith is thus a faith of worship, which cannot be regarded as salvific or redemptive because it is not moral faith; it is not grounded in a genuine disposition of the heart but rather in the assumption of divine favour

through worship. Such worship, in and of itself, lacks moral value and instead immerses people in a flood of empty rituals that foster fanaticism among nations, leading them to commit massacres and killings under the illusion of fulfilling a sacred duty and placing them in a state of perpetual hostility toward all other people.[18]

Kant firmly rejects this, for in his view, morality is the very foundation of religion, and revelation holds no epistemic status.[19] He thus set revelation aside and excluded it, not by denying the existence of God but by making God a moral postulate within the *Metaphysics of Morals*, which serves as the basis for pure rational religion.

According to Kant, morality rests upon three postulates:[20]

1. The existence of God.
2. The immortality of the soul.
3. The freedom of the will.

For Kant, rational religion is a moral religion that is entirely distinct from historical religions in general and from Judaism and Christianity in particular, which he considered borrowed garments for it. Rational religion is grounded in morality, and morality, in turn, rests on reason, unlike Christianity, a positive historical religion that grounds morality in the Kingdom of God.

Thus, pure rational religion is not something that precedes morality or merely supports it; rather, it is a religion founded upon reason, for it is grounded in morality, and morality itself is founded on reason, so it is built solely upon reason.

This understanding of religion overturns the prevailing conception of historical religions, which place absolute certainty in religious symbols. Such certainty, Kant argues, is unwarranted because the knowledge implied by these symbols transcends sensory perception and therefore cannot be possessed. Hence, the three postulates are not theoretical knowledge that can be demonstrated, in contrast to revelation, which aims to provide proofs. Instead, they are beliefs within pure rational religion that give meaning to ideas that theoretical pure reason can conceive but not prove.

These beliefs are therefore legitimate despite their lack of certainty. Moreover, they are not purely individual or subjective convictions, for reason itself has posited them as ideally suited to the human condition. Kant further argues that if we possessed complete theoretical certainty about God and immortality, it would be impossible to reject these ideas by an act of will; our morality would then be purely mechanical, reducing us to marionettes whose strings are pulled by fear and desire.[21]

Since, for Kant, moral action is not tied to its external outcomes, nor does it derive its worth from any pleasure sought, whether sensory or intellectual or from the pursuit of utility, whether private or public, its value lies solely in its being performed by the agent out of a sense of rational duty for its own sake. In emphasising this point, Kant denies true goodness to anything other than the good will, which he deems the necessary condition for an action to be moral. An action is good only if accompanied by goodwill, which is also an indispensable condition for a person to be worthy of happiness.[22]

[18] Ghīdān, al-Sayyid ʿAlī. *Falsafat al-Dīn ʿinda Kant* [*The Philosophy of Religion in Kant*], 82.
[19] Ibid., 81.
[20] al-Khashshat, Muḥammad ʿUthmān. *Madkhal ilā Falsafat al-Dīn* [*Introduction to the Philosophy of Religion*], 23.
[21] al-Khashshat, Muḥammad ʿUthmān. *Madkhal ilā Falsafat al-Dīn* [*Introduction to the Philosophy of Religion*], 24.
[22] Ghīdān, al-Sayyid ʿAlī. *Falsafat al-Dīn ʿinda Kant* [*The Philosophy of Religion in Kant*], 85.

Here, Kant transcends all prevailing religious notions of goodness, moral action, and reward or punishment, which he considers to be without intrinsic value, since goodness is understood as action arising from a good will bound by duty, its meaning shaped by reason alone.

The connection between religion and morality in Kant's philosophy is most clearly demonstrated in the postulate of God's existence, which he considers indispensable. This postulate is bound to the idea of human moral striving: our effort in the moral domain compels us to conceive of a perfect, benevolent being in whom all virtues are complete and who is capable of granting happiness to those who strive morally. God, therefore, is the ultimate guarantor of happiness and the end of moral action.

Thus, Kant underscores the profound relationship between morality and religion: morality necessarily leads to religion, pointing to a moral lawgiver beyond humanity itself, conceived as its ultimate end. He does not deny the moral depth of religion; without morality, religion has no value. In this way, reflection on pure morality culminates in the recognition of an active principle of God.[23]

Morality, in essence as Kant himself affirms, is the individual's submission to the universal and the belief that obedience to the universal is the highest form of freedom and supreme power. Thus, morality from its very inception contains a religious element.

Accordingly, Kant defined religion in moral terms, stating:

"Religion is the recognition of all our duties as divine commands. The religion in which I must first know something to be a divine command before acknowledging it as my duty...."[24]

For Kant, religion is present from the very beginning and at every stage of moral reasoning. The enlightenment in Germany, however, was less audacious than that in France. Although philosophers of both countries relied upon reason and refused to submit to any authority other than their own sovereignty, German thinkers were closer to acceptance than rejection. Humanity, nature, and God were regarded as almost one: God was seen as the final purpose in nature and as the author of moral law. This perspective can be discerned not only in Kant but also in Johann Gottfried Herder and Gotthold Ephraim Lessing, who, alongside Kant, represent the three pillars of German enlightenment philosophy.

In France, by contrast, Enlightenment thought was marked more by rejection than acceptance; reason there leaned more toward analysis than justification. Thus, a careful researcher will find that the problem of religion was deeply present throughout all stages of Kant's intellectual development before, during, and after the critical period. Religion was a guiding force for Kant, despite his evident engagement with modern science and his meticulous study of its development. Kant began his intellectual journey as a scientist rather than a philosopher. When he turned to philosophy, he did so from a scientific background heavily influenced by natural science and Newtonian mechanics, a context that shaped his philosophical inquiry through constant interaction with it.[25]

3. The concept of education

3.1. The Definition of Education: Linguistic and Terminological

[23] Ibid., 85.
[24] Kant, Immanuel. *al-Dīn fī Ḥudūd Mujarrad al-ʿAql* [*Religion within the Limits of Reason Alone*]. Translated by Fatḥī al-Miskīnī. 1st ed. Beirut, Lebanon: Jadāwil li-l-Nashr wa-l-Tawzīʿ, (2012), 243–244.
[25] Ghīdān, al-Sayyid ʿAlī. *Falsafat al-Dīn ʿinda Kant* [*The Philosophy of Religion in Kant*], 86.

Returning to the classical Arabic lexicons, we find that the word *tarbiya* (education/upbringing) is derived from three linguistic roots:[26]

1. **First Root:** *Rabā–yarbū* (to increase, to grow), as in the Qurʾānic verse:

   "And whatever you give in usury to increase within the wealth of people will not increase with God" (Q 30:39).

2. **Second Root:** *Rabī–yurbī* (patterned like *khalfī–yukhfī*), meaning "to be raised or brought up."

3. Ibn al-Aʿrābī said:

   فمن يكن سائلًا عني فإني ********** بمكة منزلي وبها ربيتُ

   English translation

   *So whoever asks about me, I am, indeed, ********** In Mecca is my home, and there I was raised.*

4. **Third Root:** *Rabba–yarubbu* (patterned like *madda–yamuddu*), meaning "to nurture, guide, govern, care for, and manage affairs."

5. Ḥassān ibn Thābit, as cited in *Lisān al-ʿArab*, said:

   ولأنت أحسن إذ برزت لنا********** ********* يوم الخروج بساحة القصر

   من درة بيضاء صافية ********* ********* مما تربب حائر البحر

   English translation

*And you were the most beautiful when you appeared to us ********** On the day you came forth to the courtyard of the palace, like a pure white pearl ********* Nurtured in the depths of the sea's basin.*

In summary, the linguistic concept of *tarbiya* encompasses growth, upbringing, and correction. These meanings complement one another, forming a comprehensive understanding of education as a process of fostering development, nurturing character, and guiding moral and intellectual refinement.

3.2. The Terminological Definition of Education[27]

The definition of *tarbiya* (education) in terminology varies according to the philosophical foundations adopted by human societies in training their generations, instilling their values and beliefs, and shaping their understanding of the educational process, its methods, and its tools.

Some Western scholars have defined education as follows:

[26] al-Muqahwī, Mawza Zayd ʿAbd Allāh. "Mafhūm al-Tarbiyya al-Islāmiyya" ["The Concept of Islamic Education"]. *Majallat al-Dirāsāt al-ʿArabiyya* [*Journal of Arab Studies*], Minya University–Kuwait, n.d., 528.
[27] Ibid., 529.

- **Plato:** Education aims to provide the body and soul with all possible beauty and perfection.
- **Aristotle:** Education is the preparation of the mind to acquire knowledge, just as the earth is prepared for plants and crops.
- **Herbert Spencer:** Education involves preparing human beings to live a complete life.
- **John Dewey:** Education is life itself, not merely preparation for life.

Among Muslim scholars:

- **Ibn Sīnā (Avicenna):** Education is *ʿāda* (habit), meaning the repeated practice of an action.
- **Ibn Khaldūn:** Education is a process of social upbringing that accustoms the individual to the customs and values prevailing in society while imparting existing knowledge and information.

Contemporary educators also differ in defining education:

- Education is a deliberate or spontaneous process shaped by a society's culture to nurture new generations, equipping them with awareness of their roles and responsibilities.
- It is the set of experiences through which a learner develops intellectual, innate, perceptual, emotional, social, and motor capacities, acquiring the knowledge and skills needed to face life and adapt to it.
- Education is a process of socialisation and acculturation, enabling full participation in society. Under specific conditions, political systems, governing structures, and firmly held beliefs, education becomes a means of shaping and refining individuals.

In general, education is a comprehensive process that addresses all dimensions of human existence: psychological, intellectual, emotional, personal, behavioural, cognitive, and social. It shapes an individual's way of thinking, approach to life, and interactions with others, occurring in the home, the school, and every environment. Education embodies individual, social, and ideal concepts, reflecting the full development of the human being.

3.3. Education in the Individual Sense[28]

Education, in its individual sense, is the preparation of a person for future life. It equips the individual to face the natural world, uncovers a child's innate abilities and talents, and works to nurture, develop, and strengthen them.

This stage, known as childhood, cannot flourish without a supportive environment and sound, guided education beginning within the family under the care of parents who pass on their cultural and educational heritage. Here, the child receives their earliest upbringing. Parents, mothers and fathers alike, as well as teachers, bear responsibility for educating children, shaping their character, and preparing them for life.

Psychologists have focused on child development, its stages, contributing factors, and age-specific characteristics, as well as individual differences. They have also demonstrated that children have essential needs that must be fulfilled to ensure healthy growth:

[28] al-Muqahwī, Mawza Zayd ʿAbd Allāh. "Mafhūm al-Tarbiyya al-Islāmiyya" ["The Concept of Islamic Education"], 530.

- Cognitive and intellectual development needs
- Physical and motor development needs
- Social and moral development needs
- Emotional and psychological development needs

4. The Relationship between Religion and Education from Kant's Perspective

Kant saw humanity's most significant task as learning how to occupy its place in creation with dignity and to understand what it truly means to be human. In the preface to his *Lectures on Pedagogy*, he writes that a human being can become truly human only through education; education forms a person, and its ultimate goal is the cultivation of character, developing a being who acts freely and preserves their own moral integrity.

Kant adds that divine providence has willed that humanity must bring forth goodness from within itself. Providence says to humankind: *Strive in the world; I have endowed you with all the capacities for goodness, and it is your duty to cultivate them. Your happiness or misery depends upon yourself.* Thus, divine providence has not bestowed goodness or evil upon humanity but rather the capacity for goodness and its development.

He further observes that within humanity, there are numerous latent seeds of virtue; our task is to cultivate these seeds in harmony with our natural capacities, to mature humanity beginning from these origins, and to work so that the human being may attain their destiny. Animals instinctively fulfil their destinies without knowledge; only human beings must actively strive to realise their purpose. This, however, is impossible unless a person possesses a clear conception of their ultimate destiny.[29]

Kant believed that education is an art that requires continual refinement through the efforts of successive generations. Each generation, having learned from its predecessors, becomes more capable of providing an education that develops all the natural capacities of humanity, ultimately guiding the entire human race toward its destiny.

He divides education into two main components: discipline (training) and enlightenment (instruction and moral formation).

4.1. Aims of Education According to Kant

- **Discipline (al-tahdhīb):** Cultivating self-control and curbing one's instincts to prepare a person for life in society.
- **Culture (al-taṯqīf):** Equipping individuals with intellectual, artistic, and practical knowledge that allows them to thrive.
- **Acquisition of prudence (ḥuṣūl al-fiṭna):** Developing wisdom and the capacity to act thoughtfully.
- **Moral Formation (takwīn al-akhlāq):** Building characters on the basis of moral law.

4.2. Types of Education According to Kant[30]

[29] Badawī, ʿAbd al-Raḥmān. *Falsafat al-Dīn wa-l-Tarbiyya ʿinda Kant* [*The Philosophy of Religion and Education in Kant*]. 1st ed. Beirut, Lebanon: al-Muʾassasa al-ʿArabiyya li-l-Dirāsāt wa-l-Nashr, 1980, 121.
[30] Ibid., 123.

1. **Physical Education**

2. a. *Education of the body:* Training the body to develop strength, health, and resilience.

3. b. *Intellectual education:* Cultivating cognitive abilities and mental discipline.

4. **Moral Education**

5. Moral education is, in Kant's view, the core element of human formation. He regarded humanity's ultimate goal as moral perfection. A person should perform good actions because they are good and fulfil their duties because they are duties. This imperative is absolute and not conditional upon circumstances or rewards.

   Moral education, therefore, must be founded on moral principles rather than mere discipline. Discipline prevents only faults, whereas moral education shapes a way of thinking. The goal is to accustom children to act according to moral laws, not out of external motives or fear of punishment. Discipline tends to become a habit that may fade over time, whereas an understanding of moral principles allows individuals to internalise and uphold justice.

   Since grasping these principles is not easy for children, parents and teachers play a crucial role in enlightening and guiding them toward moral reasoning, helping them cultivate morality from within.[31]

Kant affirms that religion is the moral law within us, insofar as it derives its authority over us from a legislature and sovereign; it is morality applied to the knowledge of God. If religion is not bound to morality, it becomes nothing more than a quest for blessings. Hymns, prayers, and attendance at church services should serve to inspire a person with renewed strength and courage to reform themselves; otherwise, they are only expressions of a heart imbued with a sense of duty. Such acts are not good deeds in themselves but merely preparations for good deeds. A person can be pleasing to the Supreme Being only by becoming a better human being.[32]

In Kant's view, religious practices and rituals do not themselves create morality; rather, their only proper function is to provide renewed energy for moral self-improvement. Vice is evil because it is evil in itself, not because God has forbidden it. A child feels within themselves a law, moral law, which must be strengthened, clarified, and affirmed in their soul. In Kant's eyes, a person is worthy of contempt when corrupt, and this contempt stems from within the moral consciousness of humanity itself, not merely because God has forbidden wrongdoing.

It is not necessary, Kant argues, for the legislator to be the creator of the law. A ruler, for example, may prohibit theft in their country, but this does not make them the creator of that prohibition. In this way, one learns that righteous conduct is the only path to being worthy of happiness, and this morality must appear as a natural law, not an arbitrary command. Thus, religion is inseparably embedded in the entirety of morality.[33]

Conclusion

A religion founded solely upon theology can never encompass true morality, for such a faith produces only fear on the one hand and, on the other hand, intentions and schemes driven by the expectation of reward, resulting merely in superstitious worship. Morality must therefore come first, followed by theology; this, according to Kant, is what constitutes religion. Moral instruction must precede religious instruction.

[31] Badawī, ʿAbd al-Raḥmān. *Falsafat al-Dīn wa-l-Tarbiyya ʿinda Kant* [*The Philosophy of Religion and Education in Kant*], 144.
[32] Ibid., 145.
[33] Ibid., 145.

In conclusion, the relationship between religion and education is one of harmony and complementarity: in the Islamic world, religion contains all the elements of both individual and social education, whereas in the Western world, both religion and education share the same aim: the establishment of universal human morality.

Acknowledgement

The author expresses sincere gratitude to the Faculty of Humanities and Social Sciences at Ziane Achour University of Djelfa for their academic support and intellectual environment that encouraged the development of this study. Special thanks are extended to colleagues in philosophy and religious studies who provided valuable insights during seminar discussions, which significantly contributed to the refinement of this paper.

Conflict of Interest

The author declares no conflict of interest. This research was conducted independently and received no specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Keywords Oral Reading, Oral Reading Errors, Fluent Reading, Reading Difficulties, Six-Minute Method

Abstract

This study aimed to investigate the effect of the "Six-Minute Method" on reducing the oral reading errors of fourth-grade primary school students. The research was designed as an "action research" study, one of the qualitative research designs. The study group consisted of six fourth-grade students attending a public school located in the Selçuklu district of Konya province during the 2013–2014 academic year. Although these students had no physical or mental disabilities, they experienced difficulties in oral reading. The selected texts for reading aloud were: Uçurtma Yarışı (Grade 4), Eşek Arısının Başına Gelenler (Grade 3), Suya Düşen Su (Grade 2), and Bizim Aile (Grade 1), all included in the Turkish coursebooks. Students' oral reading errors were identified using the "Oral Reading Error Identification Form" developed by the researchers, while their reading levels were evaluated through the "Error Analysis Inventory," which revealed that their reading proficiency corresponded to the first-grade anxiety level.

The intervention was conducted using the Six-Minute Method, applied for a total of seventy-two hours: two sessions per day, six hours per week. Instruction was delivered in forty-minute lessons, with two lessons each day, over a three-month period. Ten reading texts, approved by the Board of Education and Discipline of the Ministry of National Education for the 2013–2014 academic year, were used as instructional materials. The implementation was carried out at a private study center near the primary school attended by the participating students.

The findings revealed a significant reduction in students' oral reading errors, with all participants showing progress. Most students improved from the anxiety level to the instructional level, and some approached the independent reading level. The Six-Minute Method was found to reduce the frequency of oral reading errors and enhance students' fluency skills.

Introduction

Reading is an essential skill that typically begins to be taught in primary school and accompanies the individual throughout life. Through reading, new learning opportunities emerge, and individuals gain access to a vast ocean of knowledge. At the same time, reading develops thinking skills, enabling individuals to view the world differently and prepare themselves more effectively for life.

Although some individuals may have acquired fundamental skills such as phonological awareness or print awareness, and may even have begun reading prior to formal education, reading and writing instruction generally starts in primary school. At this stage, the primary goal is for students to acquire reading and writing skills, since academic life largely relies on reading activities. While it is expected that most students should acquire proficient reading skills by the end of the first grade, many continue to experience difficulties in subsequent grades. Such difficulties often affect performance in other subjects as well. In the literature, these issues are referred to as reading disorders or reading difficulties.

Reading difficulty is classified in the DSM-IV (2007) among learning disorders and is defined as performance in reading, mathematics, or written expression that falls significantly below expected levels, given chronological age, measured intelligence, and educational exposure.

Reading difficulties are associated with students' inadequate word recognition, slow and inaccurate reading, and poor reading comprehension (Yılmaz, 2008). Such challenges negatively affect students' adjustment to school and social environments. Conversely, difficulties in social or psychological adjustment can also contribute to reading problems (Dökmen, 1994). Observations in schools reveal that some students reach as far as eighth grade while still experiencing reading and writing difficulties. These students often encounter problems in social adjustment as well. For such individuals, reducing reading-related difficulties is essential for both academic and social success.

According to Akyol (1997), the main characteristics of students with reading difficulties include:

- Reversing letters or words when reading,
- Deficiencies in short-term memory,
- Difficulty in maintaining attention,
- Emotional vulnerability,
- Reading without comprehension,
- Eye–motor coordination problems,
- Difficulties in sequencing.

Students with reading difficulties often repeat words, misread, skip lines, pause excessively, separate syllables incorrectly, and make numerous other errors. Their reading pace is considerably slower than that of their peers, which also leads to significant comprehension problems. Family-related issues, lack of interest in reading at home, and psychological or social factors may also be considered among the causes of reading difficulties.

Errors occur in both oral and silent reading. These errors include misreading words, inserting non-existent words, omitting words, or failing to read words even after multiple attempts (Tazebay, 1997). At the primary level, some students demonstrate deficiencies in reading when compared to their classmates or to expected standards. Such students often commit errors such as pausing, regressing, skipping, and repeating words while reading. Additionally, errors may arise from an inability to grasp phrases or sentences, resulting in mechanical or word-by-word reading

(Kavcar et al., 1995). According to Başar (2013), students also make oral reading errors such as syllabication, skipping words, confusing sounds, missegmenting syllables within words, using dialectal pronunciation, and word substitutions.

The oral reading of students with reading difficulties is typically slow and filled with errors, the most frequent being repetition, addition, syllable missegmentation, and omission. Even students without reading difficulties, including fluent readers, may occasionally make such errors. Since reading is an activity that continuously influences individuals' lives, achieving adequate proficiency in this skill is essential. Correcting oral reading errors in struggling students is considered critical, as it can foster both fluent reading and improved comprehension.

Students with reading difficulties may also experience emotional challenges due to their lower performance compared to their peers. Such students often develop reluctance toward reading and gradually lose self-confidence. Addressing reading difficulties and their related problems requires collaborative effort from both parents and teachers. Since reading is a fundamental skill expected to be acquired at the beginning of primary school and used throughout life, children who fail to master this skill may face academic, social, and personal challenges. Continuous collaboration between school and family is therefore essential, alongside targeted interventions to enhance the reading skills of struggling students. Early intervention is particularly crucial for both reading and broader academic development. Otherwise, these difficulties may persist throughout life. In short, reading difficulty is a major concern for educators and researchers, provoking extensive debate and ongoing investigation.

To address reading difficulties, a variety of instructional methods have been proposed. One of these is the **Six-Minute Method**.

The Six-Minute Method

The Six-Minute Method is based on the principle of repeated reading, implemented in a structured and interactive format that pairs students with peers of similar reading ability. This method aims to help students achieve success in reading fluency. It serves as a practical instructional tool for educators, applicable in both small and large group settings, while requiring relatively little time to implement. Because it can be personalized and adapted to the current reading levels of individual students, it is a versatile approach from which all learners can benefit. The Six-Minute Method draws on key literacy skills such as phonological awareness, automatic word recognition, and text reading, all of which are essential for enhancing reading proficiency. The program is designed to be implemented in various instructional contexts by following six straightforward steps (Adams & Brown, 2009).

Required Materials

The materials necessary for implementing the method include: reading passages, two transparent folders, a felt-tip pen, two graph sheets, and a stopwatch.

Implementation Steps

The Six-Minute Method proceeds as follows:

1. The teacher announces the start of the fluent reading activity.
2. Students remove the reading passages from transparent folders.
3. The teacher sets the stopwatch for one minute and instructs the first student to begin.
4. The first student reads aloud.
5. The second student follows along, marking errors on the tracking sheet with a felt-tip pen.
6. When the stopwatch signals, the first student stops reading.
7. The second student stops marking errors.
8. The second student reports the number of words read.
9. The second student reports the number of reading errors made.
10. The second student calculates words correct per minute (WCPM), records the score on the graph sheet, and reports it to the partner.
11. **Error Correction:** The second student shows the misread words and models their correct pronunciation.
12. The first student rereads the mispronounced words correctly.

13. **Graphing:** The first student records his/her score on the graph sheet.
14. The second student hands the felt-tip pen to the first student.
15. The teacher prepares the stopwatch and instructs the second student to begin.
16. The second student reads aloud.
17. The first student follows along, marking errors on the tracking sheet.
18. When the stopwatch signals, the second student stops reading.
19. The first student stops marking errors.
20. The first student reports the number of words read.
21. The first student reports the number of errors made.
22. The first student calculates WCPM, records it on the graph sheet, and reports it to the partner.
23. **Error Correction:** The first student shows the misread words and models their correct pronunciation.
24. The second student rereads the mispronounced words correctly.
25. **Graphing:** The second student records his/her score on the graph sheet (Adams & Brown, 2009).

The Six-Minute Solution

The Six-Minute Solution can be implemented throughout the academic year. The program may begin with word lists and gradually progress toward higher-level reading passages. Before moving to a new passage or list, students repeatedly practice the same material on different days. This structure allows the intervention to be sustained over time and enables continuous development of students' reading fluency (Adams & Brown, 2009).

During implementation, the teacher's primary role is to provide guidance. In particular, the teacher intervenes when students experience difficulty in identifying or correcting oral reading errors. In practice, each student reads aloud for one minute. Following this, the number of words read, errors committed, and the correction process are carried out for two minutes. The same cycle is then applied to the partner student, completing the procedure within six minutes. Depending on students' needs, this duration may be extended.

The Six-Minute Solution differs from other oral reading interventions in that it incorporates peer learning. Working with peers at a similar oral reading level reduces potential emotional difficulties and encourages engagement. The method can be conducted with pairs or larger groups, which constitutes one of its practical advantages. Observations have shown that the number of oral reading errors tends to increase as reading time extends; thus, the flexibility to adjust the duration—either shorter or longer—is another strength of the program. Previous research has demonstrated that the Six-Minute Solution contributes positively to the reading development of students experiencing reading difficulties (Martin et al., 2014; Hanzal, 2013). Therefore, it may be considered an effective approach for improving reading fluency.

Errors committed during oral reading constitute one of the major obstacles to successful reading. In nearly every school, there are students who struggle with oral reading accuracy, which in turn hinders fluency and comprehension. Identifying such students and supporting them with appropriate reading programs is essential. To remediate oral reading errors, the careful selection of effective strategies, methods, and techniques is of critical importance.

A review of the literature in Türkiye shows that Başar et al. (2014) investigated time-based oral reading; Uzunkol (2013) examined word repetition, echo reading, repeated reading, partner reading, and paired reading strategies; Duran and Sezgin (2012) studied echo reading; Kaman (2012) focused on repeated reading; Dağ (2010) explored the 3P method and cloze technique; Özkara (2010) investigated repeated and shared reading; Karasu (2007) examined echo, paired, repeated reading, and the Fernald method; and Yılmaz (2006) studied repeated reading. All reported positive outcomes.

Internationally, Martin et al. (2014) studied natural reading and the Six-Minute Solution; Hanzal (2013) investigated the Six-Minute Solution; Swain et al. (2013) examined repeated reading, listening to text recordings, and teacher-read texts; Morra and Tracey (2006) explored fluency practices including choral reading, echo reading, repeated reading, audiobook modeling, and teacher modeling; and Keehn (2003) evaluated the impact of reader's theater.

The literature review revealed no published studies in Türkiye utilizing the Six-Minute Solution. Internationally, only two studies were found to have applied this method (Martin et al., 2014; Hanzal, 2013). Considering that some fourth-

grade students, despite having no cognitive or physical impairments, commit oral reading errors at an anxiety-inducing level, the Six-Minute Solution was deemed a potentially effective alternative for addressing such difficulties. The feasibility of its implementation even in large classrooms was a key factor in selecting this method for the present study.

Research Aim

The aim of this study is to examine the effect of the Six-Minute Solution on reducing oral reading errors of fourth-grade primary school students. To achieve this aim, the following research questions were addressed:

1. What are the oral reading levels of fourth-grade primary school students before the implementation of the Six-Minute Solution?
2. How does the Six-Minute Solution affect the reduction of oral reading errors among fourth-grade primary school students?

Method

This study employed a **qualitative research design**, as it enables the collection of detailed and in-depth data, direct exploration of participants' perceptions, experiences, and perspectives, and a comprehensive understanding of the current situation (Büyüköztürk et al., 2009). Qualitative research relies on methods such as observation, interview, and document analysis, aiming to present perceptions and phenomena realistically and holistically within their natural context (Yıldırım & Şimşek, 2013).

Specifically, an **action research design** was adopted. Action research represents a professional development model that continuously enables educators to investigate instructional practices, enhance student learning, and promote sustained improvement (Rawlinson & Little, 2004; Miles & Huberman, 1994). Mills (2003; as cited in Kuzu, 2005) defines action research as "a systematic process conducted by teachers, administrators, school counselors, or other stakeholders within a teaching–learning environment, with the aim of gaining insights into how students can learn more effectively and how instruction can be improved."

Study Group

A **homogeneous purposive sampling method** was used to select the study group. This sampling strategy aims to define a specific subgroup by forming a small, homogeneous sample. For example, in research on school–family collaboration, the researcher may select mothers with low socioeconomic and educational backgrounds who show minimal participation in school collaboration; such a group is characterized by homogeneous traits (Yıldırım & Şimşek, 2013). In this study, students with similar levels of oral reading errors and comprehension difficulties were selected to form a homogeneous group.

The study group consisted of six fourth-grade students enrolled in a public primary school in the Selçuklu district of Konya during the second semester of the 2013–2014 academic year. The inclusion criteria were: being a fourth-grade student, demonstrating oral reading errors, experiencing difficulties in reading comprehension, and having no cognitive or physical impairments. Based on these criteria, fourteen students were initially identified in consultation with their teachers. Each student was asked to read aloud an assigned text selected from Ministry of National Education (MoNE) fourth-grade textbooks, and the readings were recorded. Afterward, comprehension questions were administered.

The recordings were analyzed by three experts, who concluded that the students were at an "anxiety level" in oral reading according to the Error Analysis Inventory (Akyol, 2012). Six students were then identified as suitable for inclusion. These students, who displayed oral reading errors and comprehension difficulties but had no cognitive or physical impairments, formed the study group. Necessary permissions were obtained from the school administration, teachers, and parents, and written consent was secured. Pseudonyms were assigned to all students, and data were recorded accordingly.

Data Collection

The research process was carried out by the first author. To collect the primary data, students' oral readings were recorded using a digital audio device. The main data were derived from the analysis of these recordings. Both pre-intervention and post-intervention reading performances were evaluated.

Texts were selected from MoNE-approved Turkish textbooks used during the 2013–2014 academic year. Care was taken to choose passages that were unfamiliar to students and appropriate to their reading level. For this purpose, consultations were held with teachers to determine the textbooks used in grades 1–4. The study utilized texts from alternative MoNE-approved publications that had not been used by the students.

Preliminary assessments were conducted to determine students' reading levels. Initially, students read aloud the fourth-grade text *Uçurtma Yarışı* ("The Kite Race," 172 words, 489 syllables). Recordings revealed that students had difficulty reading at this level. Subsequently, they read the third-grade text *Eşek Arısının Başına Gelenler* ("What Happened to the Wasp," 200 words, 502 syllables), followed by the second-grade text *Suya Düşen Su* ("Water Falling into Water," 196 words, 528 syllables), and finally the first-grade text *Bizim Aile* ("Our Family," 130 words, 322 syllables). Analyses showed persistent difficulties even at these levels. Therefore, the intervention was initiated with first-grade level texts.

In total, ten texts were selected from grades 1–4 textbooks: two from first grade (*Denizatı* [137 words, 347 syllables] and *Temizliğin Önemi* [117 words, 355 syllables]); two from second grade (*Bebek Takımı* [188 words, 470 syllables] and *Uzay Gemimiz Dünya* [159 words, 393 syllables]); two from third grade (*Bayrağa Saygı* [176 words, 484 syllables] and *Uçan İlk İnsan* [238 words, 711 syllables]); and four from fourth grade (*Bir Efsanedir Amasya* [240 words, 646 syllables], *Steteskobun İcadı* [232 words, 632 syllables], *Kış Hazırlıkları* [195 words, 471 syllables], and *Tarladan Fabrikaya Pamuk* [261 words, 634 syllables]). The selected texts represented a balanced mix of narrative and informational genres.

Students' reading levels were determined using the Error Analysis Inventory (Akyol, 2012).

Implementation of the Six-Minute Method

The students whose reading levels had been identified participated in a total of 72 instructional hours using the "Six-Minute Method," conducted twice daily, six days per week. The intervention was delivered in 40-minute class sessions, with two lessons per day. During the implementation, the six students were paired into three dyads. Pairings were arranged so that students with similar oral reading performance levels were matched together. At each session, students began oral reading simultaneously and proceeded through the subsequent instructional steps at the same pace. The intervention lasted three months, totaling 72 hours of instruction. The sessions were conducted in a private study center located near the school. Students attended this center outside regular school hours, and they expressed positive attitudes toward the facility, which offered small classes of ten students and a learning-conducive environment. To sustain motivation throughout the intervention, students were provided with small rewards.

Data Analysis

Content analysis was employed to analyze the data. The principal aim of content analysis is to identify the concepts and relationships that best explain the collected data. This process involves the initial conceptualization of the data, followed by logical organization according to emerging concepts, and ultimately the identification of themes that explain the data (Yıldırım & Şimşek, 2013).

To determine students' reading levels, data from pre-intervention, initial reading, and post-intervention assessments with the Six-Minute Method were analyzed. Recordings of students' oral reading were examined and scored using the "Error Analysis Inventory," adapted by Akyol (2012) from Harris and Sipay (1990), Ekwall and Shanker (1988:412; cited in Akyol, 2012), and May (1986).

Oral reading errors were further identified using the "Oral Reading Error Identification Form," developed by the researchers with reference to Kavcar et al. (1995), Tazebay (1997), Kılıç (2000), Harris and Sipay (1990; cited in Yılmaz, 2006), Akyol (2010), Koçer (2011), and Başar et al. (2014), and structured in tabular format (Gürbüz, 2015).

Description of Oral Reading Errors

- *Repetition*: Repeatedly pronouncing the same syllables or words during oral reading.
- *Substitution*: Reading a word differently from its written form, based on the student's internal representation. For example, reading *"deve"* ("camel") as *"devler"* ("giants").
- *Hesitation*: Slowing down while reading a word without pausing entirely.
- *Syllable omission*: Omitting a syllable while reading. For example, reading *"bakkala"* ("to the grocery store") as *"bakla"* ("broad bean").
- *Syllable addition*: Inserting an extra syllable into a word. For example, reading *"silgi"* ("eraser") as *"silgili."*
- *Sound confusion*: Confusing similar letters. For example, reading *"dağ"* ("mountain") as *"bağ"* ("vineyard").
- *Sound addition*: Adding an extra sound to a word. For example, reading *"kal"* ("stay") as *"kala."*
- *Poor breath control*: Inability to maintain fluency due to inappropriate breathing.
- *Word omission*: Skipping a word during oral reading. For example, reading *"Ali ile Ela el ele"* ("Ali and Ela hand in hand") as *"Ali ile Ela ele."*
- *Dialectal variation*: Reflecting local dialect in reading, e.g., *"elektrik"* read as *"alettirik,"* or *"kağıt"* as *"kiyat."*
- *Ignoring punctuation*: Reading without attention to punctuation marks, impairing fluency.
- *Syllable reversal*: Reversing syllable order, e.g., reading *"sınıfa"* ("to the classroom") as *"sı-nı-af."*
- *Incorrect syllable division*: Incorrectly dividing syllables, e.g., reading *"Ela okula gider"* ("Ela goes to school") as *"El-a ok-ul-a gid-er."*
- *Word reversal*: Reading words backward, e.g., *"tam"* ("complete") as *"mat."*
- *Prolongation*: Extending sounds unnecessarily, e.g., reading *"geldi"* ("came") as *"geldiiiii."*
- *Failure to produce sound*: Inability to articulate certain sounds, often the phoneme /ğ/.
- *Line skipping*: Skipping a line when moving to the next.
- *Sound dropping*: Dropping a phoneme within a word, e.g., *"tahta"* ("board") read as *"taha."*
- *Line repetition*: Repeating the same line instead of moving to the next.

The frequency of each oral reading error was calculated using descriptive statistics. Each student was asked to read the selected passages aloud once, and their performances were evaluated using the Error Analysis Inventory. Students' progress in oral reading was presented in tables.

Findings and Interpretation

This section presents the findings and interpretations regarding the impact of the Six-Minute Method on reducing oral reading errors among fourth-grade elementary students.

Findings for Sub-Problem 1

The first sub-problem of the study was: *"What were the oral reading levels of fourth-grade students prior to the implementation of the Six-Minute Method?"* Data collected before the intervention were analyzed and presented in tabular form.

In order to determine students' oral reading levels, four texts selected by the researcher and approved by experts were used: a Grade 4 text (*The Kite Race*), a Grade 3 text (*What Happened to the Wasp*), a Grade 2 text (*The Dropped Water*), and a Grade 1 text (*Our Family*).

Table 2. Oral Reading Errors in the Text *The Kite Race*

Oral Reading Errors	Student A	Student B	Student C	Student D	Student E	Student F
Repetition	12	6	15	21	9	26
Substitution	5	4	13	–	12	9
Hesitation	9	9	3	1	1	2
Syllable omission	2	1	6	3	7	7
Syllable addition	3	1	1	2	10	5
Sound confusion	2	2	2	2	7	1
Sound addition	4	4	4	–	2	6
Poor breath control	2	1	2	–	–	2
Word omission	1	–	–	–	5	2
Dialectal variation	1	1	–	–	2	–
Ignoring punctuation	4	1	2	1	2	2
Syllable reversal	–	1	–	–	–	–
Incorrect syllable division	4	2	3	–	1	–
Word reversal	–	–	–	–	–	–
Prolongation	–	1	9	2	–	2
Failure to produce sound	–	–	–	–	–	1
Line skipping	–	4	2	–	–	–
Sound dropping	–	3	2	2	–	–
Line repetition	–	–	–	–	–	–
Total	**49**	**41**	**64**	**34**	**58**	**65**

Table 2 shows that students made numerous errors while reading *The Kite Race*. The most frequent error types included repetition, hesitation, substitution, and syllable addition.

Table 3. Oral Reading Errors in the Text *"What Happened to the Wasp"*

Oral Reading Errors	Student A	Student B	Student C	Student D	Student E	Student F
Repetition	2	10	14	14	7	22

Oral Reading Errors	Student A	Student B	Student C	Student D	Student E	Student F
Planning hesitation	2	2	8	4	7	12
Pausing	5	4	2	2	3	3
Syllable omission	2	1	2	–	2	1
Syllable addition	4	–	1	5	2	5
Sound confusion	2	4	4	–	5	1
Sound addition	5	1	6	3	7	6

Sound addition	–	2	3	–	1	1
Breath control error	–	–	2	–	–	–
Omission (skipping)	1	1	1	2	4	–
Dialect use	–	–	–	–	3	1
Orthographic errors	–	1	2	–	2	2
Syllable reversal	–	–	–	–	–	–
Improper syllable division	5	1	2	–	–	–

Oral Reading Errors	Student A	Student B	Student C	Student D	Student E	Student F
Word reversal	–	–	–	–	–	–
Lengthening	–	–	5	4	–	3
Failure to articulate sound	2	–	–	1	–	–
Line skipping	–	–	–	–	–	–
Sound omission	–	–	–	–	–	–
Line repetition	–	–	–	–	–	–
Total	**16**	**19**	**33**	**30**	**23**	**32**

Interpretation: As shown in Table 5, students made between 16 and 33 errors while reading *Our Family*. The most frequent errors were **repetition and planning hesitation**.

General Interpretation of Initial Findings

Analysis of students' oral reading performances demonstrated that they consistently made a considerable number of errors. Consequently, it was concluded that although these students were enrolled in Grade 4, their reading proficiency was closer to the **Grade 1 level**. Therefore, the intervention began with texts selected from the Grade 1 curriculum.

Findings Related to the Second Sub-Problem

The second sub-problem of the study was: *"How does the Six-Minute Method affect the reduction of oral reading errors among fourth-grade primary school students?"*

To investigate this, data were collected using a set of texts selected by the researcher and validated by experts. The intervention began with **Grade 1 texts** (*The Seahorse, The Importance of Cleanliness*), followed by **Grade 2 texts** (*The Baby Team, Our Spaceship Earth*), **Grade 3 texts** (*Respect for the Flag, The First Human in Flight*), and **Grade 4 texts** (*A Legend Called Amasya, Winter Preparations, The Invention of the Stethoscope, Cotton: From Field to Factory*).

This section presents comparisons between students' **initial oral reading errors** and their **errors after implementation of the Six-Minute Method**, summarized in tabular form.

Table 6. Oral Reading Errors in the Text *"The Seahorse"*

(...translated with pre-test/post-test columns as in your Turkish table...)

Interpretation: Table 6 demonstrates that following the implementation of the Six-Minute Method, all students exhibited a **substantial reduction in oral reading errors**, indicating the method's **positive effectiveness**.

Table 7. Oral Reading Errors in the Text *"The Importance of Cleanliness"*

Oral Reading Errors	Student A	Student B	Student C	Student D	Student E	Student F
Repetition	3 → 1	5 → 1	7 → 3	6 → 2	4 → 2	9 → 3
Planning hesitation	2 → -	4 → 1	5 → 1	3 → -	4 → 1	6 → 2

Interpretation: Table 8 indicates a clear decline in oral reading errors across all participants. The method proved especially effective in reducing **repetition, planning hesitation, and pausing**, which were the most common initial errors.

Interpretation: Results in Table 11 demonstrate that students benefited from the Six-Minute Method across multiple error categories. The reduction was consistent, reinforcing the method's effectiveness in improving oral reading accuracy.

Overall Findings

Across all examined texts, the Six-Minute Method produced **substantial reductions in oral reading errors** among fourth-grade students with reading difficulties. While the most frequent errors in the pre-tests included **repetition, planning hesitation, pausing, and syllable omission**, these declined sharply during the post-tests. Moreover, several error categories (e.g., dialect use, orthographic mistakes, breath control errors) were entirely eliminated after repeated implementation.

Pre: Pre-Method | **Post:** Post-Method

Analysis of Table 15 demonstrates that after implementing the Six-Minute Method, all students showed a substantial reduction in oral reading errors. These findings indicate that the Six-Minute Method is highly effective in correcting oral reading errors.

Conclusions and Recommendations

This section presents the conclusions derived from the study findings and provides corresponding recommendations.

The study initially examined the oral reading errors students made while reading texts aloud. A text appropriate for fourth-grade students—the grade level they were attending—was selected and read aloud by the students. Analysis revealed that none of the students were performing at the expected fourth-grade reading level. Subsequently, texts at the third-grade level were read aloud, and a high frequency of oral reading errors was observed. Similarly, when second-grade texts were used, students continued to demonstrate frequent reading errors comparable to those in higher grades. Finally, when first-grade texts were read aloud, it was determined that the students' oral reading skills corresponded to a first-grade level. These findings indicate that students' oral reading proficiency is significantly below their actual grade level, and they experience notable difficulties with reading aloud.

Detailed analysis revealed that students frequently repeated words, made planning errors, paused incorrectly, added syllables and sounds, misdivided syllables, and extended sounds during reading.

Previous literature supports these findings. Sidekli and Yangın (2005) reported that the primary reading difficulty of a fifth-grade student was word recognition, which caused oral reading errors. Çaycı and Demir (2006) found that third-grade students with reading difficulties made errors including misreading words, skipping words, adding words, omitting or adding letters/syllables, and pausing longer than two seconds. Yılmaz (2006, 2008) observed similar patterns of reading errors among students who were not performing at their grade level. Sarıpınar and Erden (2010) concluded that students with reading difficulties in grades 1–5 made more letter-syllable omissions, word misreadings, position changes, letter substitutions, and letter-syllable additions than their peers. Sidekli (2010) identified the most frequent errors among fourth-grade students with reading difficulties as word repetition, syllable reading, misreading words, syllable/letter omission, and letter addition. Akyol and Yıldız (2010) reported that a fifth-grade student with reading difficulties most frequently substituted words and misread words. Baş et al. (2014) also observed similar oral reading errors.

Following the determination that the students performed at a first-grade level, ten texts from different grade levels were selected for intervention, with expert consultation. Four texts were chosen at the fourth-grade level, and two texts from each of the other levels. Both narrative and informational texts were included, ensuring equal distribution across grades. The implementation began with first-grade texts, progressing stepwise to fourth-grade texts as students mastered the material. Initial readings revealed a high frequency of oral reading errors; however, following the Six-Minute Method, a substantial reduction in errors was observed across all texts, and all students demonstrated progress.

These findings are consistent with prior research. Hoskisson and Krohm (1974) found that paired reading improved reading skills in second-grade students. Samuels (1979) reported reductions in oral reading errors and improved reading fluency. Koskinen and Blum (1984) examined repeated and paired reading in third graders and observed decreased reading errors. Dağ (2010) used the 3P method with the Gap-Fill technique for students with reading difficulties and found significant reductions in oral reading errors. Multiple studies have confirmed that targeted interventions reduce oral reading errors (Kuhn, 2005; Stoddard et al., 1993; Homan et al., 1993; Rasinski & Zutell, 1990; Dowhower, 1987; Rashotte & Torgensen, 1985; O'Shea et al., 1985; Herman, 1985; Allington, 1983; Anderson, 1981).

Consistent with the literature, the present study demonstrates that the Six-Minute Method is highly effective in reducing students' oral reading errors.

Recommendations

1. Teachers should be familiar with, and apply, strategies, methods, and techniques designed to correct and improve students' oral reading skills. The Six-Minute Method is currently neither widely known nor used in Turkey; therefore, introductory seminars and training programs could be organized to promote its adoption.
2. Students with reading difficulties should be identified within schools, and targeted interventions should be conducted for all such students at appropriate times during the school day.
3. The Six-Minute Method has been demonstrated to reduce students' oral reading errors, and teachers can integrate this approach into Turkish language lessons as well as other subject areas where reading proficiency is important.
4. Since the Six-Minute Method is structured to be implemented with the entire class, it can be applied collectively, allowing all students to benefit from the practice.

5. Future research could examine the factors contributing to students' oral reading errors and investigate how the Six-Minute Method mitigates the impact of these factors.
6. This study was conducted with fourth-grade primary school students. The effectiveness of the method could also be explored in students of different grade levels to determine its generalizability across age groups.

Conclusion

The present study investigated the effectiveness of the Six-Minute Method in reducing oral reading errors among fourth-grade students. Initial assessments revealed that students' reading abilities were significantly below their actual grade level. Analysis of oral reading errors across multiple texts showed frequent mistakes, including word repetition, planning hesitation, inappropriate pauses, syllable and sound additions, misdivided syllables, and elongated sounds. These findings indicate substantial difficulties in reading aloud, suggesting that students' oral reading proficiency is not aligned with their expected educational level.

Following the implementation of the Six-Minute Method, a significant reduction in all categories of oral reading errors was observed. Students demonstrated clear improvements in fluency, accuracy, and self-confidence in reading aloud. This finding aligns with previous research, which consistently shows that structured, timed reading interventions, including paired reading, repeated reading, and guided reading strategies, effectively reduce oral reading errors and improve reading fluency (Hoskisson & Krohm, 1974; Samuels, 1979; Koskinen & Blum, 1984; Dağ, 2010; Kuhn, 2005; Stoddard et al., 1993; Homan et al., 1993; Rasinski & Zutell, 1990; Dowhower, 1987).

The study also highlights the scalability and adaptability of the Six-Minute Method. Its structure allows for both individual and whole-class implementation, making it feasible for diverse classroom settings. Teachers can integrate this method not only in language classes but also in content areas where reading competence is essential. Additionally, the method's positive impact on students' oral reading performance suggests that early and consistent intervention can prevent the widening of literacy gaps and support students' academic development across subjects.

In conclusion, the Six-Minute Method represents an effective, practical, and evidence-based approach for reducing oral reading errors among primary school students. Its application can substantially improve students' reading fluency, enhance their engagement and confidence, and provide teachers with a structured tool to address reading difficulties. Future studies should investigate its long-term effects, its application across different grade levels, and its potential for integration with other reading intervention strategies. The findings of this study strongly support the adoption of the Six-Minute Method as a standard component of literacy instruction in schools, particularly for students experiencing reading challenges.

Acknowledgement

This article was produced from the master's thesis entitled *The Effect of the Six-Minute Method on Fluent Reading*, prepared by Abdurrahman Gürbüz under the supervision of Assoc. Prof. Dr. Murat Başar at Uşak University. The authors would like to express their gratitude to the students and their families who voluntarily participated in this research, as well as to the educational institution and private study center that facilitated the implementation process.

Conflict of Interest

The authors declare that they have no conflict of interest regarding the research, authorship, or publication of this article.

Keywords Ancient Greece, Aristotle, Logic, Contemporary Logic

Abstract
Logical studies are among the most precise and focused areas of philosophical inquiry. This precision is one reason why the development of logic has followed a cumulative path. Consequently, the earliest foundations of logic remain a primary reference for any researcher in the field. If we are to identify a key figure in this process, we must speak of Aristotle. However, Aristotle's coherent and structured contributions to logic did not emerge in a vacuum. They were preceded by numerous logical rules and principles formulated by earlier Greek philosophers. While these earlier contributions lacked the systematic organization that Aristotle later achieved, they laid the groundwork for his innovations. Aristotle's logical works are marked by their originality, richness, and diversity, and they continue to withstand the test of time despite the rise of modern symbolic logic and contemporary logical theories.

Introduction

Human beings, despite their differences, have been practicing logical thinking since they first began using language and constructing speech. Man is a logical thinker by nature, and he alone unlike other living beings is capable of making judgments, distinguishing right from wrong, and deriving conclusions from given premises through mental processes that have no equivalent in the rest of the animal kingdom.

If we were to define the human being in contrast to other species, we might say that he is the creature who thinks logically and applies logical reasoning to acquire knowledge across various disciplines, manage daily life, and assess behaviors and interactions.

Although logical studies are often attributed primarily to the philosopher Aristotle, this does not mean that logical thinking did not exist before him. Elements of logical reasoning can be found in earlier civilizations. In Indian philosophy, for example, we encounter logical contributions in Buddhist thought, the Nyāya school, Gautama's works, and the writings of Dharmakīrti. Likewise, in Greek civilization, logical thinking appeared before Aristotle.

Socrates employed implicit rules of logic in his efforts to expose the contradictions of the Sophists, relying on principles of reason. Plato inherited and developed this method, laying the early groundwork for formal logic. However, the conclusions he reached did not carry the necessity required for valid inference.

Aristotle corrected this by introducing the concept of the middle term, through which necessary conclusions could be reached. His defining contribution was the development of syllogistic theory (theory of the syllogism) and its rules, which had a lasting impact on the evolution of logic.

1. Logic in Ancient Greece Before Aristotle

While Alexander Macfarlane discussed Indian logic and the main schools that engaged with it, Blanché focuses on its development in ancient Greece before presenting Aristotle's theory of logic.

The use of logical principles does not necessarily mean an awareness or formal understanding of them just as a person may speak grammatically without knowing the rules of grammar. If asked to explain the rules, such a person may be unable to do so. The same is true for logic before Aristotle.

Blanché argues that the early Greek logicians used logical principles in their thinking, but they did not yet formulate them as an independent and organized discipline.

1.1 Early Logical Practice Before Aristotle

The early thinkers before Aristotle were content with using logic in their discussions and writings without possessing the ability to define its principles or organize them systematically. Aristotle himself acknowledged this after completing his study of logical [1] matters, stating: "On this subject, nothing had been prepared at all indeed, nothing existed whatsoever." (Blanché, Logic and Its History from Aristotle to Russell, 2004, p. 7)

Despite this, the implicit use of logic in earlier periods remains highly significant. It laid the groundwork and offered the first signs from which formal logic would later emerge. The debates practiced before Aristotle brought to light many problems related to thinking. These challenges inspired and hastened the development of logical theory.

We can say that the evolution of logic passed through three stages. The first stage was marked by a kind of debate that took the form of recommendations. These were not expressed explicitly or systematically but appeared within dialogue [2], The Second and Third Stages of Logic's Development

The second stage relates to the rules and foundations that were used implicitly. This is the work that Aristotle undertook and organized in a book titled Topics.

The third stage marks the shift from the study of dialectical argument to the study of forms of formal reasoning. This development is found in his works Analytics and On Interpretation (Blanché, Logic and Its History from Aristotle to Russell, 2004, p. 8).

Aristotle's contribution can be seen as a transition from spontaneous practice to the conscious understanding of rules. It reflects a move toward systematic thinking. For this reason, Blanché states: "The Prior Analytics marks a systematic break—not only with all earlier forms of logical practice among the Eleatics, Sophists, and Plato, but also with Aristotle's own earlier logical writings." (Ali, 2013, p. 199) Although the early implicit phase of logic was necessary, it can be outlined in the following way:

1.2 Dialectic in the Eleatic School

The Eleatics' style of thinking was characterized by [3] Using Logical Arguments. This approach stems from the school's close relationship with mathematical thinking and its fundamental concepts. This influence reached a significant level. Among the key ideas that shaped their contribution to logic were the notions of the infinite and binary division.

Although some have attributed the founding of the Eleatic school to Xenophanes, its true founder is Parmenides. It is said that the young Socrates met him and was influenced by his ideas and positions. Parmenides himself was initially influenced by the Pythagorean school. However, he later chose a different path and developed a method of his own. This method centered on rejecting the Heraclitean principle of change and replacing it with a principle of unity and stillness. As Heraclitus (535–470 BCE) believed that things are in constant motion and that opposites come together to form harmony within multiplicity, Parmenides took a completely opposite view. He stood in clear opposition to these ideas (Ryan, 2014, p. 731).

Parmenides expressed his philosophy in a poem made up of two parts. The first part addresses truth, and the second presents popular opinions. In the first section, he starts with the central idea of his doctrine: what exists is, and what does not exist is not. In this way, he formulated the principle of identity in logic, which affirms the preservation of the nature and essence of things.

Zeno of Elea (490–430 BCE) was a student of Parmenides. According to Tricot (1992, p. 29), he was "the first conscious dialectician to use dialectic in the sense later defined by Aristotle." His role was to respond to critics and opponents of the Eleatic doctrine. He defended the ideas of unity and stillness and rejected the concepts of movement and plurality. His main criticism was directed toward the Pythagorean school, which believed that the universe consists of numbers. From their perspective, the world is characterized by change, not stability.

Zeno is also credited with articulating the principle of contradiction. As Makovelsky (1987, p. 52) points out, "Zeno was the first to expose contradictions within prevailing concepts." Aristotle also links the development of dialectic to Zeno and considers him one of its first contributors. Zeno presented precise arguments and inferences aimed at challenging the theories of his opponents and revealing the contradictions within them. He did this by using the method of reductio ad absurdum.

Zeno's work focused on refuting opposing arguments. He did not, however, establish a formal set of rules to govern the type of reasoning he used to reject the principles of the Pythagorean school, especially their belief in motion and plurality. Nonetheless, he was highly skilled in demonstrating the impossibility of motion, as shown in examples such as "Achilles and the Tortoise" (Copleston, 2002, p. 70).

What sets Eleatic dialectic apart is its ontological character. It is rooted in a metaphysics of being and built on the idea that the world is intelligible and can be explained in a comprehensive way. This idea later appeared in Aristotle's thought as well, where he continued to maintain a realistic and grounded approach to logic.

1.2. The Controversy of the Sophists

The Sophists [4] Dialectic for Its Own Sake. Among the Sophists, dialectic reached its peak. They practiced argumentation for its own sake. Socrates strongly opposed them, using reason and evidence to expose the flaws and contradictions in their views. The Sophists used arguments to pursue specific goals and personal interests, often following a highly pragmatic and utilitarian approach. Their central claim was that "man is the measure of all things, of what is, that it is, and of what is not, that it is not" (Plato, p. 152). This statement became the foundation of Sophist philosophy, especially in the works of Protagoras (485–411 BCE), Gorgias (480–375 BCE), Hippias (443–400 BCE), and Prodicus (465–396 BCE). These thinkers moved beyond cosmological inquiries and turned to the study of humans in political and ethical contexts. They laid the groundwork for rhetoric and oratory and showed a strong interest in language studies.

The Sophists rejected traditional claims of acquiring knowledge in an objective way. They embraced a relativist view inspired by Heraclitus' philosophy, which held that everything is in flux. They concluded that all opinions, however diverse or contradictory, could be equally valid. Each individual expresses their view according to their own perspective. The Sophists articulated this theory of relativism in Dissoi Logoi (Double Arguments), a text by an unknown author that presents the idea of absolute relativity regarding human concepts such as good and evil, beauty and ugliness, justice and injustice, and truth and falsehood (Makovelsky, 1987, p. 57).

Based on these concepts, the Sophists often paired contradictory notions or treated them as distinct. A single case, for example, could be viewed by a judge as either just or unjust. Things could simultaneously be seen as real or unreal, good or bad—depending on how they relate to other things and within specific contexts.

The Sophists began engaging with logic when they started defending their views in realistic ways. Their public debates attracted large audiences. Protagoras even wrote a book on this skill titled The Art of Persuasion. In it, he analyzed deductive reasoning, using the same method Aristotle would later develop in his work on inference in Topics.

The Sophistic school was not a unified movement. Its thinkers held different intellectual and political views. While Protagoras strongly defended democracy, Lycophron opposed social inequality and the privileges of the aristocracy. Antiphon (480–411 BCE) advocated for equality without distinction. Some Sophists also promoted the idea of natural rights, though their views varied. Certain philosophers linked natural rights to the power of the strong and believed that the role of the state was to protect these rights. Others, however, defended morality, human values, and religion, and associated natural rights with these ethical foundations.

In contrast to the Sophists, Democritus was one of their most vocal critics. He adopted the atomist doctrine of Leucippus (460–370 BCE) and built upon it a comprehensive theory that extended into knowledge, logic, ethics, and other areas. In epistemology, he believed that reason and the senses are distinct but interconnected. Reason reflects the external world through what the senses convey. In logic, he wrote a treatise composed of three books.

The Sophists were also able to distinguish between various types of propositions. In his book Good Speech, Protagoras outlines several forms of predication. These included seven modes of speech: declarative, interrogative, imperative, vocative, narrative, and optative. They also explored modal propositions, such as those involving possibility and probability. Moreover, they paid closer attention to doubtful or uncertain propositions than to those regarded as absolutely true. This approach later appeared in the work of mid-twentieth-century logicians and contributed to important developments in fields such as computer science and artificial intelligence.

1.3. Dialectic in Socrates (Socrates 470–399 BCE)

The importance of Socrates in the history of logic becomes clear through the dialogues and discussions he held with the Sophists. These took the form of questions and answers. In these exchanges, he used the methods of irony and maieutics. Georges Tricot considered him the founder of the philosophy of concepts, which focuses on the essence of things and their basic characteristics. This approach laid the foundation for Plato's theory of Forms, which is based on fixed essences and absolute truths (Tricot, 1992, p. 31).

1.4. Dialectic in Plato (Plato 427–347 BCE)

Blanche devoted a special section to Plato, in which he discussed his various works and the techniques he used in his dialogues. These techniques are seen as early forms of logic.

There is no doubt that Plato's dialogues show great intellectual skill. However, they also contain logical flaws that any trained logician can notice. Plato's reasoning was not always sound. For instance, when he states: "If a soul is wise, it is a good soul. Therefore, a soul that is the opposite of a wise one is a bad soul" (Blanche, Logic and Its History from Aristotle to Russell, 2004, p. 11), he commits a logical fallacy. The conclusion here suggests that from the negation of (A), we can infer the negation of (B). In fact, valid reasoning should move in the opposite direction: from not (B), we conclude not (A).

It is important to highlight Plato's major role in the emergence of logic as a system of rules. Blanche believed that Plato's contribution lies in discovering the laws that govern the movement of phenomena. These same laws also apply to reasoning. While the laws of nature are fixed, humans tend to impose their own views. As a result, reasoning often appears distorted. For this reason, we must learn to use logical rules to avoid errors in reasoning.

In Timaeus, Plato says: "If a god has offered us the freedom to reflect, it is so that we may use it. We must align the cycles of our divine reason with the cycles of thought that occur within us. These cycles are of the same nature, but the divine ones are constant, whereas ours are always changing. Through this study, we can contribute to correct natural calculations. By imitating the perfect, error-free movements of the divine, we may offer guidance to the confusion within us." (Plato, 1970, p. 42)

Thus, the general principles we follow in pursuit of the Forms allow us to gain proper understanding of the nature of knowledge.

Plato used the five universals in what he called the ascending and descending dialectic. The ascending dialectic, also called the upward process, begins with the particular and moves toward the abstract universal or ultimate idea. This process resembles induction, where we move from judgments about parts to judgments about the whole. This is known as material logic (R. Kaltszer, 1982, p. 47).

The descending dialectic, or downward process, moves from the universal to the particular. It is the reverse: from the broadest genus, to the next-level genus, to the species, and finally to the specific differentia (Blanche, Logic and Its History from Aristotle to Russell, 2004, pp. 13–14).

Blanche explains that the method proposed by Plato was later corrected by Aristotle. Plato's method does not lead to necessary conclusions. That is why Aristotle replaced Platonic division with the syllogism, which does produce necessary results. The syllogism includes a middle term that links the major and minor premises and must meet certain conditions. This makes the conclusion valid.

In Platonic division, we cannot always determine whether one term truly belongs to another in the second premise. Instead, the method offers only a choice between two possibilities: (B) or (not B). In contrast, the minor premise in Aristotle's syllogism clearly defines the relationship between two terms. Blanche provided a chart to show the key differences between Platonic division and Aristotelian syllogism, as follows:

Platonic division:

Q is (L)

It is not divided into (B) nor (B)

So Q is it?

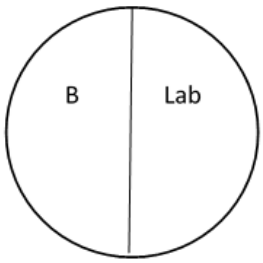

Figure 1 Platonic division

Aristotelian Analogy : (x) is (a)

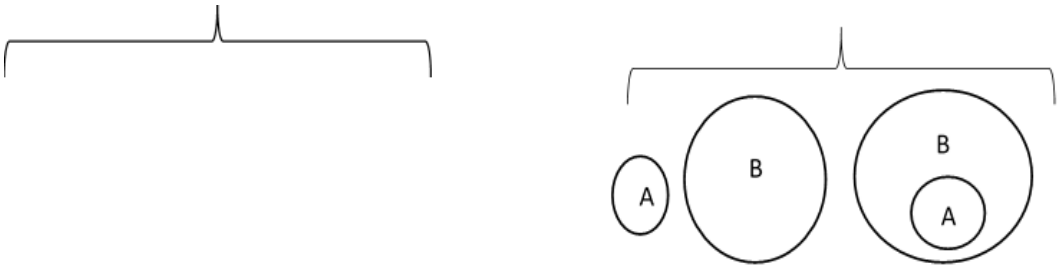

Figure 2 Aristotelian Analogy

(a) is (b) (a) is (lab)

2. Logic in Aristotle (Aristotle, 384–322 BCE)

Blanche begins his historical account of Aristotle's work by discussing a range of logical topics. These include opposition, conversion, syllogism and its interpretation, modal logic, induction, and demonstration. When referring to Aristotle's logical works, Blanche notes that they appear as an organized set of treatises, which might suggest that Aristotle himself arranged them. However, Blanche disagrees with this view.

He explains that the credit for compiling these texts goes to Aristotle's eleventh student, who assembled them in the first century BCE. Blanche also points out that not all of the logical works attributed to Aristotle are necessarily his. Some are genuinely authored by him, while others were only attributed to him. For instance, the De Interpretatione is not directly referenced in his other writings, which casts doubt on its attribution. Similarly, the Categories has also raised questions. Scholars believe that the final chapters of the Categories (Catégories / Κατηγορίαι) are not consistent with the rest of the text. These later sections are thought to have been added in a questionable way, as they seem disconnected from the original topic of the treatise.

2.1. Aristotle's Logical Works and Their Chronological Order

Blanche affirms that the term "Organon" was adopted [5] The term Organon was one of the names given by Aristotle's students to the collection of his logical works. The word means "instrument" or "tool." The number of works attributed to him in this domain has been counted as sixteen. This number is confirmed by both Makovelsky and Georges Tricot in their book Formal Logic.

Porphyry wrote an introduction to these works, known as the Isagoge. This became one of the most well-known texts among Arab scholars (Saliba & Kamal 'Ayyad, Logic and the General Methods of Science, 1942, p. 62). The Isagoge includes the five predicables: genus, species, specific difference, property, and common accident. It is usually followed by Aristotle's Categories (Categoriae or Catégories), which presents ten fundamental categories. Aristotle considered these to be primary genera that are self-evident and do not require definition or proof. They are: substance, quantity, quality, relation, place, time, position, possession, action, and passion. Blanche did not discuss them in detail, believing that their content was already well known. He did, however, mention five additional categories, which he believed were later additions by Aristotle's students.

The second book in order is On Interpretation, also known as the Book of the Proposition. It deals with logical operations such as opposition and conversion, as well as modal propositions, including those that are probable and necessary.

Blanche provides an overview of the third book, Analytics, also referred to as the Analytica. It is divided into two parts. The First Analytics contains two books that present the formal rules of syllogistic theory. The Second Analytics, also in two books, deals with syllogisms based on necessary premises, which is what Aristotle called demonstration.

Finally, we find the Topics, a work composed of eight books. However, the most important texts for logicians have been On Interpretation and the First Analytics (Blanche, Logic and Its History from Aristotle to Russell, 2004, p. 20). In addition, there are references to logical themes in other works, including Aristotle's formulation of the principle of non-contradiction in Metaphysics.

Blanche also notes that certain books—or parts of them—were likely not written by Aristotle himself but were later attributed to him. For example, the last five chapters of the Categories do not align with the introductory material at the beginning of that work.

2.2. Blanchet's Commentary on Aristotle's Logical Works

Blanchet interprets the sequence of Aristotle's works—as presented by his students—as methodical and coherent. He explains that the Categories comes first because it introduces concepts, which serve as the initial step in logic and are necessary for defining terms. It is followed by On Interpretation, which discusses the proposition. A proposition is a composition of two concepts. Then comes the Prior Analytics, which deals with combining propositions in what is known as syllogism. Syllogism, as Blanchet notes, is one form of reasoning. This arrangement, according to him, reflects a progression from the simple to the more complex.

When examining the concept itself, Aristotle did not formulate an elaborate theory. He simply referred to general concepts, as found in the Categories. As for the theory of syllogism, Blanchet argues that Aristotle developed it at a relatively late stage. He even suggests the possibility that Aristotle had not yet discovered the syllogism when he composed the Categories and On Interpretation, as there is no evidence in either text that prepares for such a theory. The absence of a clear logical foundation in these earlier works raises questions. This inconsistency led Blanchet to doubt the authenticity of the received sequence of Aristotle's writings.

Blanchet proposes an alternative ordering of Aristotle's logical corpus. He bases this reordering on internal content and conceptual maturity. In his view, the Analytics—both the first and second books—reflect a degree of logical development that makes it unlikely they were written before the Categories or On Interpretation, which contain less advanced theories.

He also believes that Aristotle only arrived at the idea of syllogism in a later phase of his logical studies. Thus, it is probable that Aristotle was not yet familiar with syllogistic reasoning when composing the Categories. Consequently, Blanchet rejects the traditional order of the works and suggests another sequence that he finds more plausible. He considers the Categories as the starting point, followed by the Topics, and then Sophistical Refutations. He places the Prior Analytics next, beginning from the first part through to the

seventh. After that, he includes the first book of the Posterior Analytics, then returns to complete the Prior Analytics from chapter eight to twenty-two. These chapters address modal propositions. Finally, he refers to the second book of the Prior Analytics, which contains refined analyses of syllogistic theory and introduces logical expressions that serve as keys for understanding more advanced logical operations (Blanchet, Logic and Its History from Aristotle to Russell, 2004, p. 21).

Among the criticisms directed at Blanchet is his omission of any discussion concerning the chronological priority of the later parts of the Prior Analytics. Although he suggests that some of these parts were composed concurrently with the second book of the Prior Analytics, he does not explain their internal sequencing. Moreover, he neglects to address the arrangement of the second book of the Posterior Analytics. Additionally, his claim that modal logic represents the highest stage of logical thought carries some risk. It is entirely possible that modal logic predates syllogistic reasoning.

Despite Blanchet's efforts to establish a chronological order for Aristotle's logical works, he overlooks the later chapters of the Prior Analytics and does not attempt to organize the second part of the Posterior Analytics. Therefore, the true chronological order remains unknown—not only to Blanchet but to all others. Aristotle alone knew the actual sequence in which his logical system developed.

2.3 The Proposition and Immediate Inference

Blanché, in his discussion of concept, definition, and logical propositions, did not merely cite Aristotle's main ideas. He began by examining Aristotle's view of the proposition as a declarative statement that can be either true or false. In such propositions, the subject is either affirmed or denied of the predicate. A proposition, according to Aristotle, is "any speech that is meaningful not in the way of a tool but by convention, and not every speech is assertoric; only that which can be true or false is assertoric, and this is not the case with all statements" (Aristotle, De Interpretatione, 1948, p. 63). What Aristotle calls an assertoric statement is precisely what logic aims to study. Therefore, the grammatical sentence differs from the logical proposition.

This distinction is also emphasized by Avicenna (Ibn Sīnā), who states: "This class of composition that we are about to mention is the declarative composition. It is the one for which we can say of its speaker that he is either telling the truth or lying. As for interrogatives, requests, wishes, hopes, and exclamations, we do not say of their speaker that he is truthful or lying" (Ibn Sīnā, Al-Ishārāt wa al-Tanbīhāt, 1960, pp. 267–268). From this, we understand that every proposition is a sentence, but not every sentence is a proposition.

Blanché views propositions through two main lenses: quantity and quality. In terms of quality (qualité), propositions are either affirmative or negative. In terms of quantity, they are either universal or particular. Quality is not determined by the subject or predicate, but rather by the copula that connects or separates them. Considering both quantity and quality together yields four types of propositions: two affirmative and two negative.

The distinction between universal and particular propositions depends on the nature of the terms. If the subject is a proper name, the proposition is singular. If the subject is a general term, the proposition is universal. Blanché notes that Aristotle paid little attention to singular propositions. This, he argues, is due to their unsuitability for conversion, which requires propositions of the same type, allowing the subject and predicate to switch places. Singular propositions lack referents in the way universals do. As for indefinite propositions, Aristotle treated them as equivalent to particular ones.

Blanché distinguishes between two types of universal propositions: essential universals and existential universals. In his Topics, Aristotle also divides particular propositions into definite and indefinite types.

Propositions can be approached in two ways: conceptually or extensionally. If interpreted extensionally, the subject falls under the predicate. If interpreted conceptually, the predicate is included in the subject. Blanché raises the question of which interpretation Aristotle preferred. After reviewing various interpretations, he

notes that philosophers have generally explained Aristotle's syllogistic theory conceptually, where the relation between terms is one of necessity. In contrast, logicians and mathematicians tend to offer an extensional or formal interpretation, where the relationship is one of inclusion.

Yet Aristotle, according to Blanché, employed both interpretations. He did not limit himself to an extensional view but also adopted a conceptual perspective. Nevertheless, Blanché argues that Aristotle favored the conceptual interpretation. This is evident in categorical propositions, especially when the subject is general. In such cases, the predicate necessarily follows from the subject. However, when it comes to syllogistic reasoning, the extensional interpretation becomes more dominant, particularly in discussions of formal validity (Blanché, La Logique et son histoire d'Aristote à Russell, 2004, pp. 30–31).

Blanché's analysis of Aristotle's syllogism reveals his own preference for the conceptual view, a position he maintains in his critique of formal logic in La Raison et le discours, where he criticizes the purely extensional interpretation. In contrast, Marie-Louise Roure interprets Aristotle's logic as leaning toward an extensional reading, even though Aristotle himself believed that conceptual understanding grounds the referents of terms (Roure, M., 2014, p. 18).

Blanché identifies three key relationships between the four standard categorical propositions: inclusion, expressed by the universal affirmative when the subject is included in the predicate; exclusion, expressed by the universal negative when the subject is denied of the predicate; and intersection, represented by the particular affirmative and particular negative propositions.

2.4 Opposition and Conversion

Blanché's discussion of propositions does not stop at their classification. He also examines a basic mental operation—reasoning which results from the combination of propositions. Reasoning is divided into two types. Immediate inference involves two propositions, where the conclusion is drawn directly from a single premise. Mediate inference, on the other hand, involves three propositions: two premises and a conclusion.

Focusing on immediate inference, the conclusion (i.e., the second proposition) is obtained by altering the quantity, quality, or both of the first proposition. The resulting proposition is the conclusion. This kind of inference is called opposition. The second type of immediate inference is conversion, where the subject and predicate exchange places.

A. Opposition

The concept of opposition in Aristotle has been previously noted, defined as follows: "One thing opposes another in four ways: either by relation, or by contrariety, or by privation, or by affirmation and negation" (Aristotle, De Interpretatione, 1948, pp. 38–39). Aristotle's types of opposition do not exhibit homogeneity or strict ordering. The first three kinds of opposition occur between concepts, while only the fourth kind exists between propositions.

Blanché points out that the theory of opposition and conversion is fully present throughout Aristotle's logic because dialectic and debate require it, even though Aristotle himself does not explicitly present this classification in exactly the same terms.

In his De Interpretatione, Aristotle discusses opposition between propositions, highlighting key differences between universal and particular propositions, as well as their interrelations. Opposition is fundamental in argumentation and necessary for refuting opponents and dismantling their arguments.

Regarding the negation of propositions, Aristotle distinguishes two types: contradiction and contrariety. The latter does not represent absolute opposition, whereas contradiction involves total opposition. In

contradiction, two propositions cannot both be true nor both be false. From the contradiction relation, one can infer the truth of one proposition from the falsehood of the other, and vice versa.

In contrariety, however, the truth of one proposition implies the falsehood of the other, but the falsehood of one does not necessarily imply the truth of the other. Blanché notes that Aristotle initially did not differentiate sharply between contradiction and contrariety, treating contradictory propositions similarly to contrary ones (Blanché, Logic and Its History from Aristotle to Russell, 2004, p. 35).

Contradiction occurs between the universal affirmative and the particular negative, and between the universal negative and the particular affirmative. Contrariety, on the other hand, exists only between the universal affirmative and the universal negative. The contrary propositions can both be false when the corresponding particular propositions are true simultaneously.

Aristotle did not explicitly include this relationship between particulars; this extension was added later by logicians. This omission does not mean Aristotle was unaware of the law, as he alludes to it in De Interpretatione. As for subalternation (implication from universal to particular), Aristotle does not explicitly address it, but it was later completed by Apollonius of Perga to render the square of opposition more coherent.

B. Conversion

Another form of immediate inference is called conversion, in which the subject and predicate of a proposition are exchanged. Both subject and predicate must be concepts. Blanché notes that the predicate of a proposition varies; it may denote essence, making the proposition a conceptual definition, or a property particular to the subject, or a genus, or even an accident.

Aristotle encountered no problem converting propositions when the predicate expresses essence or a particular property, since in such cases the truth-values coincide for subject and predicate. Thus, only propositions containing essence or particular property are convertible.

Conversion of the universal negative proposition is straightforward because quantity and quality are preserved. However, conversion of the universal affirmative differs. In the original proposition, the species is included under the genus, but the reverse—placing the genus under the species—is invalid. Therefore, the converse must be particular; a part of the genus is included in the species. The particular negative proposition cannot be converted.

2.5 Syllogism

Aristotle discusses various types of inference in his Topics. Alongside inductive reasoning, he presents deductive reasoning, which moves from universal judgments to particular ones. Deductive reasoning is itself divided into demonstrative, dialectical, and sophistical types. The classification depends on the nature of the premises: demonstration involves necessary premises (or those derived from necessary principles), whereas dialectical syllogisms rely on generally accepted premises, which may be refuted as errors if falsely presented as commonly accepted (Blanché, Inference, 2003, p. 127).

Aristotle defines syllogism as follows: “It is a discourse in which, given certain things, something different from the things given necessarily follows of necessity because of their being given” (Prior Analytics, 1980, p. 142).

He acknowledges that syllogism is the most expressive form of inference. However, he admits that some valid inferences may not appear in syllogistic form.

A syllogism consists of three terms and three propositions. Each term appears twice. One term serves as the middle term, connecting the other two in the premises, which leads to the conclusion uniting the two remaining terms. The terms differ in extension: the term with the broadest extension is called the major term, the narrowest is the minor term, and the intermediate term is the middle term.

The well-known example "All humans are mortal; Socrates is a human; therefore, Socrates is mortal" was never used by Aristotle himself. He did not employ singular propositions and instead used literal variables such as (S), (P), and (M) to represent terms. The first to formulate Aristotle's syllogism with such variables was Alexander of Aphrodisias, aiming to demonstrate deductively how conclusions follow from premises (Łukasiewicz, 1961, p. 21).

Blanché criticizes the view that these symbols were central to Aristotle's late works, asserting that Aristotle's use of variables was more a matter of convenience than systematic formalization.

Some scholars, including Bocheński and other contemporary logicians, consider Aristotle the true originator of formal logic. In contrast, Hamblin argues that Aristotle's logic is overly described as formal and that it lacks the rigor found in modern formal systems [6] Stoic logic was influential, but Łukasiewicz believes that Aristotle's brief mention of it marks the initial step toward formal logic (Blanché, Logic and Its History from Aristotle to Russell, 2004).

Blanché raises the issue of using variables and symbols instead of words in logic and links this to how we perceive the discipline. If logic is viewed as a theoretical science, comparable to mathematics, the use of symbols becomes necessary. However, if logic is considered a normative science, akin to ethics or aesthetics, words are preferred. Aristotle, however, was not sufficiently aware of these possible perspectives on logic.

Returning to syllogism, Aristotle classified syllogisms into three types according to the role of the middle term. He then examined the possible combinations, known as figures. In Leach figure, he identified a set of valid moods based on formal criteria, without delving into the content of the propositions. The three syllogistic figures Aristotle described are as follows:

First Figure: Here, the minor term is predicated of the middle term, and the middle term is predicated of the major term. Aristotle states: "The last term is universal of the middle, and the middle is universal of the first" (Prior Analytics, 1980, p. 113). This figure produces four valid moods:

- If all S is included in all M, and M is predicated of all P, then S is predicated of all P.
- If S is excluded from all M, and all M is included in all P, then S is excluded from all P.
- If S is included in all M, and M is predicated of some P, then S is predicated of some P.
- If S is excluded from all M, and M is predicated of some P, then S is excluded from some P.

Second Figure: In this figure, the middle term is the predicate in both premises. Aristotle explains: "If a single thing is predicated universally of one thing and not at all of another, or predicated of both" (Prior Analytics, 1980, p. 118). This figure also yields four valid moods:

- If M is not included in all S, while it is predicated of all P, then S is excluded from all P.
- If M is included in all S and excluded from all P, then S is excluded from all P.
- If M is excluded from all S and predicated of some P, then S is excluded from some P.
- If M is included in all S and excluded from some P, then S is excluded from some P.

Third Figure: Here, the middle term serves as the subject in both premises. Aristotle describes it as: "If both premises are predicated of the same thing, one universally and the other partially, or both universally, or neither universally" (Prior Analytics, 1980, p. 124). This figure produces six valid moods:

- When both S and P are included in all M, then S must be included in some M.
- If some M is included in P and all M in S, then some S is not P.
- If some M is included in all P and all M in S, then some S is included in P.
- If all M is P and some M is S, then some S is P.
- If no M is P and some M is S, then some S is P.
- If some M is P and all M is S, then some S is not P (Tricot, 1992, p. 274)

The fourteen moods mentioned earlier include both valid (complete) and invalid (incomplete) syllogisms. The complete syllogisms belong to the first figure. Several reasons support the greater completeness of this figure. First, it is widely used in sciences and mathematics. Second, the conclusions derived from this figure express the essence of things, whereas the conclusions of the second and third figures tend to be either negative or partial. Third, the first figure is self-sufficient; it compensates for the shortcomings found in the second and third figures.

Beyond these three reasons, another important factor favors the first figure: the middle term occupies an intermediate position between the major and minor terms, both in location and in terms of its scope of reference.

Regarding the second and third figures, although they are productive, they appear somewhat unnatural, particularly the second figure, where the middle term has the widest and most inclusive scope.

The proof of the validity of the second and third figures can only be achieved through the first figure. Here, "proof" does not mean direct proof but rather reduction of syllogisms to the first figure. Aristotle believed that the moods of the second and third figures are defective because the relationships of inclusion between the middle term and the major and minor terms are not harmonious, which makes the resulting conclusion unclear (Blanché, Logic and Its History from Aristotle to Russell, 2004, p. 50).

The syllogisms of the first figure, which Aristotle considers complete and legitimate, were challenged by nineteenth-century logicians. They started from different assumptions than Aristotle's. His preference for the first figure and rejection of the others stemmed from his belief that the figure is fundamental. The first figure was the original one Aristotle discovered, or in a narrower sense, the first mood of the first figure.

Blanché points out that the names Aristotle gave to the three terms can cause some confusion. In the second figure, where the middle term is predicate in both premises, it becomes, from a validity perspective, the major term. In the third figure, where the middle term is subject in both premises, it becomes, from a validity standpoint, the minor term.

The identification of a syllogistic figure depends on the position of the middle term within it. This aligns clearly with the aims of formalism. From this modern perspective, it is necessary to acknowledge the existence of a fourth figure. This figure considers the case where the middle term is predicate in the major premise and subject in the minor premise. Therefore, logicians who align with formalism emphasize the importance of including a fourth figure [7] This figure also produces four valid and legitimate moods. Some may question whether Aristotle was aware of these valid moods. The answer lies in the fact that we find five such valid moods discussed by Aristotle in Book I, Chapter 7, and Book II, Chapter 1 of the Prior Analytics. These moods closely resemble those of the fourth figure. Both Łukasiewicz and Bocheński argue that these two chapters were added later, after Aristotle had already presented the three figures and their types in Chapters 4 and 6 of Book I (Łukasiewicz, 1961, pp. 16–17).

2.6 Interpretation of Aristotelian Syllogism

Aristotelian logic can be seen as somewhat distorted. For example, the terms we use like "Socrates" or "human" were not explicitly mentioned by Aristotle. Łukasiewicz observes that Aristotle employed only symbols such as (A, B), representing universal terms. Essentially, Aristotle presented all propositions as

conditional syllogisms with a necessary relation between the two statements. The first statement acts as the premise, while the second serves as the conclusion.

Therefore, the debate over whether Aristotle's syllogistic theory belongs to the class theory (Théorie des classes) or the theory of predicates is somewhat futile. Aristotle's theory stands on its own, with its own issues and axioms. Łukasiewicz explains that Aristotle's syllogistic system represents an initial conception of what mathematical logic later developed as the theory of "classes" (Łukasiewicz, 1961, pp. 16–17).

Aristotle's proof of the syllogistic moods involves reducing them to the first figure, specifically to two moods: BARBARA and CELARENT. However, Aristotle later recognized the possibility of conversion and reduction. The syllogisms of the first figure can be reduced to some moods of the third figure. Likewise, the negative syllogisms of the first figure can be reduced to those of the second figure.

Aristotelian logic, as Łukasiewicz noted, is formal but not purely symbolic. Blanché agrees with this view. Although Aristotle used variables, he did not explicitly represent them symbolically. This raises Blanché's question: if Aristotle's logic is not symbolic, can it still be considered formal?

Bocheński and Łukasiewicz raise this question and attempt to answer it through several inquiries. They ask, for example, if Aristotle used symbols instead of terms or propositions, why did he not provide a clear explanation for this usage? He employed the same symbols both for terms and propositions. Additionally, Aristotle sometimes uses the word "statement" to refer both to a single proposition and to a syllogism (a set of propositions). Another issue concerns the nature of the predicate and subject of propositions: are they concepts or specific terms?

To verify the legitimacy and validity of moods, Aristotle employed concrete examples. Initially, the logical form served merely as a tool to achieve the essential goal of logic: truth. Over time, this idea evolved until emphasis shifted to the structural forms of syllogisms rather than their concrete applications.

Blanché raises another concern regarding the classification of Aristotelian logic. According to Łukasiewicz, Aristotle's logical theory is purely scientific, free from any philosophical implications. This view is supported by the fact that Prior Analytics can be understood without prior knowledge of Aristotle's Metaphysics. However, Blanché argues that this view oversimplifies the issue, especially from a historian's perspective who considers the interconnectedness of Aristotle's work. Aristotle's logic fits perfectly within his philosophical system, as does Stoic logic.

The categorical form Aristotle uses aligns with his metaphysical concept of substance. The middle term corresponds to the principle of causality; it acts as the cause of the syllogism (Blanché, Logic and Its History from Aristotle to Russell, 2004, p. 59). Therefore, Aristotle's logic is somewhat narrow, reflecting only the inclusion relation while excluding others. This can only be properly understood by linking it to Aristotle's metaphysics.

Łukasiewicz accepts the idea of defining syllogistic figures based on the position of the middle term, without relying on inclusion relations between terms. This implies he does not consider Aristotelian logic as symbolic logic. Otherwise, Aristotle could have abandoned defining syllogisms by the position of the middle term and moved to a validity-based interpretation, which is closer to the truth, rather than blaming Aristotle for rejecting the fourth figure (Blanché, Logic and Its History from Aristotle to Russell, 2004, p. 63).

2.7 Induction and Demonstration

Induction and demonstration are not solely related to logic in its strict sense. They are also connected to epistemology and methodology. While syllogism, according to Aristotle, is a hypothetical science and serves as a tool for knowledge, it cannot be regarded as the sole instrument of science. This is because syllogism

requires the truth of its premises to be established. Such truth demands proof in two possible ways: either by infinite regression or by circular demonstration.

Initially, knowledge derives from sensation, but sensation alone is insufficient for its formation, as it applies only to particulars, whereas knowledge is universal. Therefore, induction is necessary. Through induction, we move from judgment about particulars to judgment about universals. Following this, demonstration allows us to reach conclusions. Learning occurs only through induction and demonstration. If induction starts from particular cases, demonstration begins with universal cases. Moreover, universal judgments are made only through induction, and induction itself ultimately rests upon sensation. As Aristotle states, "Demonstration proceeds from universal premises, induction from particulars, and we cannot know the universal except through induction" (Posterior Analytics, 1980, p. 385).

The distinction between induction and syllogism does not negate the relationship between them. This connection exists only in material terms, not formal ones. Syllogistic reasoning is based on the interrelation of concepts, which requires a middle term linking the premises. In induction, however, there is no middle term; instead, it concerns a collection of observed instances. Lachelier (1832–1918) argues that induction is a form of the DARAPTI syllogism, which yields a particular affirmative conclusion. He also notes that this is a syllogism of the third figure. Regarding the results each method produces, they differ greatly: induction's results are probabilistic, whereas syllogistic results are absolutely certain.

Jules Tricot views induction in its syllogistic form as drawing the major premise from comparing the minor premise and the conclusion. Hence, induction in this form is reversed compared to Aristotle's view, where the conclusion should be the major premise and the middle term becomes the minor premise. Therefore, the middle and minor terms should share the same extension, which contradicts the normal arrangement (Tricot, 1992, pp. 370–373).

Aristotle accepts induction temporarily because he sees knowledge as fundamentally deductive, favoring syllogism. His goal is to eliminate induction, which does not rely on the principle of identity. For Aristotle, particular induction is foreign to formal logic since it is synthetic, not analytic.

Demonstration, on the other hand, represents the ultimate goal of science. Aristotle's mistake was his belief that science could be addressed purely deductively through analysis of forms. However, modern science recognizes the necessity of returning to experience as a crucial means to achieve deductive reasoning, the highest aim of science. John Stuart Mill confirms this when he says, "Syllogism is originally connected with a theory of meaning... but the universal major premise 'all men are mortal' corresponds, according to empiricists, to a known number of particular experiences" (Briand, 1987).

3. Conclusion

From the foregoing discussion, we can draw several key conclusions:

Logic is as ancient as humanity itself. In ancient Greece, many early signs and logical inquiries were closely linked to dialectical debates among the Sophists, Socrates, and Plato. However, the logical works produced in ancient Greece did not develop into a fully established scientific theory that could serve as a crucial reference for contemporary logical studies.

Aristotle's work is distinguished by its richness, diversity, and originality. It is also characterized by clear organization and coherence among its parts.

Aristotle's theory of syllogism stands as his most significant contribution to logic. It exerted a considerable influence on later logicians, particularly through the work of Lukasiewicz, who authored Aristotelian Syllogistic from the Perspective of Modern Logic.

Aristotle's syllogism centers on a single relation—subsumption. However, this relation alone proved insufficient because logic also encompasses other relations, such as equality, inclusion, and logical product, among others.

Aristotle showed interest in possible and future contingencies. This focus became the starting point for modern logicians who sought to establish three-valued logic.

Aristotle gave equal attention to both the conceptual and the truth-relational aspects of logic. In contrast, contemporary formal logic tends to emphasize formal structure at the expense of conceptual interpretation. This divergence distances modern logical studies from the familiar philosophical approach—a positive aspect credited to Aristotle.

4. References and Explanations:

[1] Logicians: We use this term to refer collectively to those engaged in logic. Dr. Mahmoud Yaacoubi has employed this word frequently in his works, including Logic and Its History and Introduction to Contemporary Logic. He finds this term particularly suitable, especially given the need for Arabic terminology that parallels logical terms in other languages.

[2] Dialogue: To say "he dialogued," "he argued," or "engaged in dialogue" means to debate or discuss. Dialogue refers to the exchange or review of speech in conversation between a speaker and an interlocutor. The purpose of dialogue is to generate new ideas. (Sleeba, Philosophical Dictionary, 1982, p. 501)

[3] The Eleatic School: This school is named after Elea (ELEA) in southern Italy. It is said that its founder was Xenophanes. Although he never visited Elea itself, Xenophanes is considered its founder because he rejected the idea of gods having bodies. He agreed with the school's leaders—Parmenides, Zeno, and Melissus—in affirming the unity of all things. This static unity is called "the divine." Aristotle reported that Xenophanes stated that "the One is God," who in no way resembles humans either in body or thought. (Kamel & Jalal Al-Ashri, p. 70)

[4] Sophist: The term originally meant a skilled person in a particular art, especially teachers of philosophy and rhetoric. Sophists first appeared in the mid-fifth century BCE. Before that, young Greeks received initial education from language scholars. Sophists were the first higher education teachers and were itinerant, giving lessons in each city they visited. Their lectures were costly, with Protagoras earning, according to Plato, more than a sculptor. (Pierre Degennebié, 2014, p. 15)

[5] The Organon: This is the collection of Aristotle's logical works, including Categories, On Interpretation, Analytics (First and Second), Topics (Dialectic), Sophistical Refutations, and Introductory Topics (Isagoge). (Lalande, 1996, p. 724). The collection consists of six books, though some add Rhetoric and Poetics, increasing the total to eight.

[6] System (Nasq): In philosophy and theoretical sciences, this refers to a set of coherent and interconnected ideas that support each other, such as Aristotle's system. (Madkour, 1983, p. 201)

[7] The Fourth Figure of the Syllogism: The syllogistic form where the middle term is the subject in the major premise and the predicate in the minor premise is traditionally attributed to Galen. In fact, Galen discussed compound syllogisms made of four terms. However, the specific fourth figure involving three terms was not discovered until the sixth century CE. It is important to note that Aristotle was not unaware of the five valid forms generated by this syllogistic figure.

Acknowledgment

The author expresses sincere gratitude to the Department of Philosophy at Mohamed Ben Ahmed Oran 2 University for their continuous support and encouragement in the pursuit of this research. Special thanks are extended to colleagues and mentors who provided valuable insights on the historical development of logic, and to the academic community whose works laid the foundation for this study.

Conflict of Interest

The author declares no conflict of interest. This research was conducted independently, without any financial or personal relationships that could inappropriately influence the findings or interpretations presented in this article.

Abstract
This article examines the activities of prestigious universities in Germany, Poland, and the Czech Republic, focusing on innovations within their educational systems, similarities and differences across institutional structures, and their broader contributions to global knowledge and society. Special emphasis is placed on the development of material and technical infrastructure, the scope of scientific research, international collaboration networks, and the implementation of scholarship and grant programs. These initiatives are shown to play a crucial role in enhancing teaching quality and shaping research with contemporary relevance. The study highlights that such universities hold a significant position not only within their national frameworks but also in the scientific, economic, social, and cultural development of the wider world. Attention is further given to the historical trajectories and development paths of these institutions, underlining the importance of both scientific-technological progress and the human factor in shaping modern universities. The article also addresses the question of "What constitutes an Innovative and Entrepreneurial University?", evaluating the role of universities in knowledge production and applied research. Finally, the study discusses the implementation of entrepreneurial functions in Azerbaijani and other post-Soviet higher education institutions, identifying existing progress as well as limitations, and analyzing the underlying causes and consequences.

Introduction

During my visits to higher education institutions in Germany, Poland, the Czech Republic, and Russia, I observed that these universities have successfully integrated the latest technologies, innovative teaching models,

and modern methodological approaches into their academic processes. The effective use of material and technical resources, coupled with highly qualified academic staff, has significantly contributed to the enhancement of teaching quality and the preparation of professional specialists.

State-of-the-art laboratories and equipment at these universities reflect continuous modernization in line with global demands. Particularly within medical faculties, laboratories resemble research-production complexes. For instance, the pharmaceutical products developed at institutions such as Jagiellonian University in Krakow, Heinrich Heine University in Düsseldorf, Humboldt University of Berlin, the Technical University of Berlin, and Charles University in Prague are widely recognized as among the highest-quality medicines worldwide. These drugs are often created, tested, and refined within university laboratories before being distributed internationally, bringing academic, economic, and social benefits not only to the universities themselves but also to broader societies (Stopka; Tijsen, 2006).

Furthermore, these universities support research projects that aim to improve living standards, ensure public health, and safeguard environmental sustainability. The underlying principle is clear: qualified personnel, knowledgeable scientists, creative specialists, and advanced technology collectively foster an effective academic and research environment. Such an environment produces both capable graduates and high-quality products, contributing directly to the wellbeing of society.

Another notable observation is the significant investment of grant funding into research projects, awarded to individuals with the intellectual and academic capacity to engage in advanced scientific inquiry. Research in these institutions is conducted with cutting-edge equipment and resources, ensuring quality and reliability. Importantly, strong collaboration networks exist not only among university staff but also between universities and research centers across the globe, as well as with industrial partners.

These dynamics expand the scope of universities far beyond teaching and research, embedding them within innovation systems, entrepreneurial activities, and global knowledge networks. Integration of education, science, and innovation, alongside international partnerships, social cooperation with organizations, and the creation of business links, forms the foundation of an innovative and entrepreneurial university environment.

Collaboration with 405 Scientific Organizations Worldwide: The Case of Jagiellonian University

Jagiellonian University in Poland actively collaborates with nearly 400 of the world's leading higher education institutions, positioning itself among the top-ranked universities globally. Established on May 12, 1364, by the decree of King Casimir the Great, the university initially comprised three faculties—liberal arts, medicine, and law. However, the law faculty faced difficulties in maintaining stable activity, and following the king's death, the university temporarily ceased operations.

Polish scholars, recognizing the indispensable value of science and education, persistently sought to revive the institution. Their efforts were realized on July 26, 1400, when King Władysław II Jagiełło ordered its reopening, with the addition of a theology faculty. In the 15th century, faculties of law and philosophy were also established, marking what is often described as the university's golden era. During this period, Jagiellonian became a flourishing academic hub that attracted students from across Europe, including Russians, Lithuanians, Hungarians, Germans, English, Dutch, Czechs, Swedes, French, Italians, Spaniards, and Turks. This diversity reflects the university's long-standing role as a center of knowledge meeting the intellectual demands of its time (Graham; Lankin et al. 2011)

From its earliest years, Jagiellonian was recognized as a leading institution for the study of law, mathematics, and astronomy—fields highly relevant during the Middle Ages. These academic achievements contributed to the training of distinguished scholars and specialists who significantly influenced European intellectual life.

Today, Jagiellonian University continues to rank among the world's best institutions, as confirmed by its placement in the Shanghai Rankings and the *Times Higher Education Supplement* (QS World University

Rankings). In addition to being a center for advanced research, the university prioritizes international academic cooperation, student exchange, and scholarship programs. At present, over 130 projects and programs are active, involving partnerships with 405 research organizations worldwide. These collaborations foster fundamental research, strengthen global academic networks, and enhance the university's capacity for scientific innovation (EC-2010)

Jagiellonian University's Scholarship Programs: How Do They Shape the Advancement of Science?

Scholarships for students form a central component of Jagiellonian University's mission. These funds operate under various titles, supported by diverse sources, including private donations and institutional endowments. For instance, the **Private Scholarship Fund**, established between 1999 and 2002 at the initiative of the university's rector, originally relied on contributions from organizations and individuals seeking to support the development of science in Poland. Over time, its scope expanded significantly.

Among the most notable initiatives is the **Queen Jadwiga Fund**, which provides financial support to students and researchers from Central and Eastern Europe. Queen Jadwiga, renowned for her philanthropy, dedicated her personal wealth to advancing education and scholarship at Jagiellonian University and in Poland more broadly. The fund was designed to strengthen international academic ties and promote scholarly exchange across Eastern and Southern Europe. Supported through both individual and corporate donations, the fund accumulated substantial "iron capital," ensuring its sustainability regardless of future levels of investment.

Another example is the **Bogdan Łysiak Scholarship Fund**, created from a donation by his daughters, Lidia Proczyk and Anna Łysiak. It aims to provide financial assistance to outstanding students specializing in Ukrainian philology within the Faculty of Philology. The scholarship is awarded annually for a period of ten months, with applications accepted each spring semester (Golubev, 2010).

The **Ad Polonos Scholarship Fund**, established in the autumn of 2016, was founded through the contribution of Professor Urszula Marty Doleżal to honor the memory of her late husband, Professor Marian Doleżal. Its mission is to support the education of young people of Polish descent, particularly those whose families suffered displacement. The fund provides financial assistance to students of Polish origin from Belarus, Georgia, Kazakhstan, Lithuania, Russia, and Ukraine who are pursuing degrees at Jagiellonian. Scholarships are granted for a ten-month period.

In addition, the university offers **PhD scholarships**, typically lasting one year, to enable doctoral students to conduct more effective and impactful research. Depending on the progress and outcomes of the candidate's work, the scholarship may be renewed. Applications are accepted throughout the academic year.

The prestigious **Rector's Scholarship** was created for outstanding graduates of bachelor's and master's programs at Jagiellonian University. Selection criteria include high **GPA (Grade Point Average)** scores as well as exceptional achievements in science, the arts, or sports. This scholarship is designed to support talented graduates in their early careers but may also be granted to current students under exceptional circumstances. Students holding a "Polish Card" (Karta Polaka) are also eligible to apply (Grudzinskiy, 2004).

These diverse scholarship programs reflect a broader European academic culture, where investments in science and education are designed to be sustainable and impactful. Initiatives are carefully structured to ensure continuity, often expanding beyond their original scope to include additional institutions, countries, and partners. Importantly, the primary aim is not immediate financial profit but rather the advancement of education, scientific research, and social development.

German Universities: Distinctive Features

Among Europe's highest-ranked institutions, **Berlin Technical University**, **Humboldt University of Berlin**, and **Heinrich Heine University Düsseldorf** hold prominent positions. A defining characteristic of technologically

advanced, so-called "innovative countries" is their commitment to substantial investment in science and education. Germany stands at the forefront of this group, with approximately 30 universities listed among Europe's most innovative institutions (Grudzinskiy, 2004).

Germany's higher education system is distinctive for its classification of institutions into several types, a structure not commonly replicated elsewhere. These include:

- **Hochschule** – Institutions with a focus on the humanities.
- **Fachhochschule** – Universities of applied sciences, specializing in practical disciplines such as engineering, business administration, design, and social sciences. These typically offer four-year programs, including two semesters of industrial practice.
- **Universität** – Comprehensive universities with broader academic scope, offering nearly 400 subjects across disciplines such as medicine, law, engineering, natural sciences, theology, economics, sociology, and agricultural studies. Universities integrate both **fundamental and applied research**, enabling students to specialize across a wide spectrum of scientific fields (Peterkova, et al. 2022).
- **Technische Universität** – Technical universities specializing in engineering and the natural sciences. For example, **Berlin Technical University** conducts advanced theoretical and applied research in physics, chemistry, mechanical engineering, electronics, metallurgy, and related disciplines.

Alongside these categories, Germany also maintains specialized institutions in pedagogy, theology, fine arts, music, and film studies.

German higher education is organized into **three cycles**:

1. **Bachelor's degree (B.A., B.Sc., B.Eng.)** – typically 3–4 years, with *Fachhochschule* programs requiring four years plus industrial practice and a final thesis.
2. **Master's degree (M.A., M.Sc., M.Eng.)** – lasting 1–4 years, strongly research-oriented and culminating in a thesis and state examination.
3. **Doctoral degree (Ph.D.)** – requiring 2–5 years, depending on the complexity of the research. Students independently select their supervisors, who then define suitable research topics. German universities' strong research infrastructure, material resources, and grant-based project funding provide favorable conditions for doctoral research.

This system not only ensures academic rigor but also encourages intellectual autonomy, allowing students to navigate their own academic trajectories (Asadov. 2021).

Humboldt University of Berlin: A Model of Modern Higher Education

Founded in 1809 by **Wilhelm von Humboldt**, philologist, philosopher, statesman, and diplomat, Humboldt University is one of Germany's most historically significant academic institutions. Currently, it hosts students from over 100 countries. Over its **210-year history**, the university has produced an exceptional roster of scholars and cultural figures, including **Johann Gottlieb Fichte** (its first rector), **Friedrich Schleiermacher**, **Georg Wilhelm Friedrich Hegel**, **Arthur Schopenhauer**, **Albert Einstein**, **Max Planck**, **Karl Marx**, **Friedrich Engels**, **Heinrich Heine**, **Otto von Bismarck**, and **Robert Schumann**.

Initially established with faculties of law, medicine, theology, and philosophy, the university admitted 256 students in its first year, taught by 52 professors. Within a short time, it developed extensive campuses, natural science centers, and a medical campus. By the early 20th century, Humboldt had emerged as a hub of intellectual and scientific progress (Sidorova, 2014).

However, the university's history also reflects the turbulence of Germany's political landscape. During the **Nazi era**, Humboldt University suffered significant setbacks: thousands of books from its library were burned, approximately 250 Jewish professors were dismissed, and many other scholars critical of the regime were

expelled. The war years left parts of the campus destroyed, and the university was temporarily closed. Today, the **memorial at Bebelplatz**, symbolized by empty bookshelves, commemorates this tragic period.

The **Humboldtian Model of Higher Education** emerged in the early 19th century, reshaping universities worldwide. This model rested on three core principles:

1. **Unity of teaching and research** – universities should simultaneously cultivate knowledge and advance scholarship.
2. **Academic freedom** – both faculty and students must enjoy autonomy in research and teaching.
3. **Cultural mission** – universities should contribute not only to professional training but also to national intellectual and cultural development.

This model profoundly influenced the development of higher education across Europe and North America. American reformers such as **Daniel Coit Gilman** drew inspiration from Humboldt, advocating for research-based graduate education in the United States, particularly in medicine and history. Similarly, the model impacted the evolution of French, Russian, and British universities [Nalëtova, 2005].

Philosophical underpinnings of this model were rooted in German classical philosophy, particularly the works of **Immanuel Kant**, **Fichte**, **Schelling**, and **Schleiermacher**. By synthesizing their ideas, Humboldt articulated a vision of the university as both a cultural institution and a research center. This framework not only shaped German education but also provided a **prototype for the modern research university** globally.

As Schwedelbach (2002) argues, Humboldt envisioned universities as institutions serving **three essential functions**:

1. To operate as centers of professional training, culture, and research.
2. To remain at the forefront of intellectual achievement.
3. To contribute directly to national development.

Thus, Humboldt University is more than an academic institution; it represents a foundational **paradigm in the global history of higher education**, bridging cultural, intellectual, and scientific progress.

Transformation of the Humboldt University Model

At the turn of the 20th to the 21st century, the **Humboldt University model** continued to evolve in response to new global challenges. This transformation enabled the expansion of higher education from an **elitist system to mass education**, and from mass education to universal accessibility. As a result, universities diversified their functions and developed into comprehensive academic, research, and production structures. The adaptation of the Humboldt model to modern conditions has increased the role of universities in **socio-economic development, social mobility, and the resolution of global challenges** [Vasilenok & Shapiro, 2004].

Following World War II, the **University of Berlin** reopened in 1946. Much like the city itself, the university reflected the political division of Germany: in the Federal Republic, it became known as the **Free University of Berlin**, while in the German Democratic Republic, it continued as the **University of Berlin**, renamed in 1949 as **Humboldt University of Berlin**. Despite ideological constraints under the Socialist Party, from the 1970s the institution reestablished **international cooperation** with leading universities across Western Europe, Asia, Africa, and Latin America. After German reunification, extensive reforms were introduced: much of the faculty was replaced with specialists from West Germany, and significant investments were made to modernize the university's infrastructure and strengthen its scientific potential.

Today, Humboldt University functions as a **global research center**, attracting students and scholars from across Europe and the wider world. It provides opportunities for both **theoretical and practical education**, enabling students to pursue careers as specialists and researchers. Its academic ecosystem is enriched by collaborations

with multinational corporations, research institutes, and clinical facilities. Of particular note is **Charité – Universitätsmedizin Berlin**, one of Europe's largest and most advanced university hospitals, operating under the auspices of Humboldt University.

Currently, the university encompasses **11 faculties and 261 academic programs**. Examples include:

- **Agriculture and Horticulture Faculty**: horticultural sciences, agrarian economics, fisheries and aquaculture, soil nitrogen research.
- **Law Faculty**: bachelor's, master's, and doctoral programs covering German and European law, political science, and intellectual property law.
- **Economics Faculty**: economics and statistics, corporate finance, financial engineering, applied economics.
- **Mathematics and Natural Sciences Faculties (I and II)**: the first focuses on chemistry, physics, and biology; the second on psychology, mathematics, geography, and computer sciences.
- **Philosophy Faculties (I–IV)**: covering history, computer science, European ethnology, German literature, classical philology, social sciences, cultural studies, art history, health sciences, pedagogy, and rehabilitation.
- **Theology Faculty**: ancient and modern languages, history, philosophy, and psychology of religion.
- **Medicine Faculty**: operating within Charité Medical Center, offering cutting-edge research and clinical training.

Charité, founded in 1710 during a plague outbreak, has since grown into Europe's largest and most renowned university hospital, encompassing **four major campuses in Berlin**. Its guiding motto—**"Research, Teach, Heal, Help"**—reflects its mission. The hospital is a pioneer in **minimally invasive surgery**, employing advanced technologies such as the **Da Vinci robotic surgical system**.

Internationalization and Dual-Degree Programs

One of Humboldt University's notable innovations is its **dual-degree programs**, which foster academic mobility and expand students' intellectual horizons. These programs are offered in collaboration with prestigious global universities, including **King's College London, University of Bologna, University College Dublin, University of Vienna, Tallinn University, Université Paris Diderot (Paris 7), University of Rome III, University of Rome Tor Vergata, Complutense University of Madrid, Charles University in Prague, University of Washington, and the University of North Carolina at Chapel Hill**.

Humboldt also participates in **student exchange and internship programs**, offering placements at leading universities such as the **National University of Singapore, University of São Paulo, University of Toronto, Uppsala University, University of Queensland, University of Zurich, Princeton University, Waseda University, and Stellenbosch University**. In addition, it is a partner in the **Erasmus Mundus program**, which provides international mobility opportunities for both study and internships.

Scholarship and Grant Programs

Humboldt University offers an extensive range of **scholarships and grants** designed to support academically talented and active students, particularly at the master's, doctoral, and postdoctoral levels. Selected programs include:

- **Humboldt Post-Doc Scholarships** – for doctoral graduates wishing to continue research at the university. Duration: 6 months, with a stipend of €1,500 per month and coverage of travel expenses.
- **International Research Awards (for women)** – targeted at female doctoral students. Duration: 6 months, with a stipend of €1,750 per month.

- **Caroline von Humboldt Programme (for women)** – supports doctoral candidates on maternity or childcare leave. Provides €1,365 per month plus €400 for childcare.
- **Rosa-Luxemburg-Stiftung Scholarships** – awarded annually to 150 active students promoting democratic values, gender equality, and social justice. Each recipient receives €750 per month.

Berlin Technical University

Another prominent institution is the **Berlin Technical University (Technische Universität Berlin, TU Berlin)**, unique in Germany as a technical university that also integrates **humanities and social sciences**. TU Berlin offers strong programs in **sociology, chemical engineering, biology, and business administration**, and enjoys an excellent reputation in the labor market. Statistics indicate that most graduates secure employment in their field within one year, making TU Berlin a strategic choice for students aspiring to careers in European industries.

The university conducts advanced research in **civil engineering, computer science, and programming**, and collaborates with major German corporations such as **Deutsche Telekom, Siemens, Bosch, and Daimler**, which often co-finance large-scale research projects. TU Berlin also serves as a **training hub for multinational corporations** across Germany, France, Italy, and beyond, preparing highly qualified specialists in mechanical engineering, industrial management, and information technologies.

Its alumni include distinguished Nobel laureates and pioneers of science and technology, such as **Gustav Hertz**, **Konrad Zuse** (inventor of the first programmable computer and high-level programming language in 1941–1948), **Karl Bosch**, **Gerhard Ertl**, **Eugene Wigner**, **Dennis Gabor**, and **Werner von Braun** (designer of the first ballistic missiles and later a key architect of NASA's rocket programs). In architecture, **Bruno Taut**, a leading figure of modernism and the "New Objectivity" movement, is among its notable graduates; many of his buildings were later recognized as UNESCO World Heritage Sites.

In total, TU Berlin counts **10 Nobel laureates and 2 national prize winners** among its alumni, underscoring its reputation as one of Europe's leading centers of engineering and innovation.

Berlin Technical University: Research and Academic Profile

Berlin Technical University (TU Berlin) offers **over 100 academic programs** at the bachelor's, master's, and doctoral levels. Through agreements with **26 universities worldwide**, graduates may obtain dual degrees. The university hosts **40 research institutes** engaged in fundamental scientific investigations.

Currently, TU Berlin conducts **large-scale international research** in areas such as **cyber-physical systems, energy, rational use of resources, ecology, design, development of new materials, and optimization of production processes**. Overall, the university participates in **120 major international projects**, while faculty members contribute to **1,500 scientific studies** annually. Professors and students also engage in at least **40 scientific, startup, and spinoff initiatives each year**.

Several **master's programs in English** are available, requiring minimum admission scores of **IELTS 6.5, TOEFL 88, or CAE grade C**.

The structure of TU Berlin's faculties reflects its mission to integrate **science and practice**. Since its renaming in 1946, the university has pursued a dual focus on **technical and humanistic disciplines**.

- **Faculty I: Humanities and Educational Sciences** – established to balance technical training with the humanities, supporting interdisciplinary research in social sciences, natural sciences, and engineering.
- **Faculty II: Mathematics and Natural Sciences** – covering mathematics, physics, and chemistry, including traditional mathematics as well as technical and business mathematics.

- **Faculty III: Process Sciences** – internationally recognized for innovative approaches to education and research. Its mission is to enhance students' research capacity by combining **practical training, creativity, and industry applications**. Faculty III plays a central role in shaping Berlin's scientific agenda and research strategy.

Heinrich Heine University Düsseldorf

Founded in **1965**, Heinrich Heine University Düsseldorf (HHU) has grown into a prominent **research university** with a **network of campuses, clinics, laboratories, specialized libraries, and research centers**. Approximately **35,000 students** are enrolled. Established on the basis of the Düsseldorf Medical Academy, the university maintains a strong focus on research-led teaching.

HHU comprises faculties of **Law; Mathematics and Natural Sciences; Medicine; Arts and Humanities; Business Administration and Economics**.

The **Faculty of Medicine**, originally founded in 1907 as the Academy of Applied Medicine, is the university's historic core. It quickly achieved international recognition through fundamental research and clinical practice. Today it includes **31 institutes, 30 clinics, and two central facilities** (an animal research center and a biomedical research center). The faculty collaborates closely with specialized institutes such as the **Leibniz Institute for Diabetes Research** and the **Institute for Environmental Hygiene Research**. Research areas span **hepatology, cardiovascular diseases, ecological medicine, gerontology, neuroscience, and molecular biology**. Its clinics serve nearly **200,000 patients annually** with state-of-the-art medical equipment and laboratories.

HHU is a major participant in **Erasmus Mundus** and other European-funded programs. Numerous grant schemes support scientific activity, including **Family Mobility Grants (FMG), Partnership Mobility Grants (PMG), Social Development Mobility Grants (SCMG), and High-Potential Mobility Grants (HPMG)**.

The **Heine Research Academies** provide structured training and career development for young researchers. These include:

- **iGRAD** – the Interdisciplinary Graduate and Research Academy, founded in 2008 within the Faculty of Mathematics and Natural Sciences.
- **medRSD** – the Medical Research School Düsseldorf.
- **PhilGRAD** – the Graduate Academy of the Faculty of Philosophy.
- **Young Academics and International Research Centers** – coordinating interdisciplinary initiatives.

The **Walter Benjamin Program** supports early-career researchers pursuing independent studies after completing their doctorate. Other competitive programs include the **European Research Council (ERC), Emmy Noether Programme, Heisenberg Programme, Liebig Fellowship (Chemical Industry Fund), Volkswagen Foundation initiatives, and German cancer research networks**.

The **Junior Scientist and International Research Center (JUNO)** further these aims by fostering **academic career development and international collaboration**. JUNO seminars prepare students for research careers and facilitate cooperation with international scholars (EC-2010).

In 2018, the university established the **Strategic Research Fund** to enhance its research profile, competitiveness, and innovation capacity. The fund supports (1) young researchers' projects, (2) large-scale collaborations, and (3) rector-approved strategic initiatives. Importantly, from the **first year of study**, students are introduced to research activities, scholarship opportunities, and study-abroad programs—creating an environment for early talent development.

Although HHU is a **state university**, it also welcomes contributions from private benefactors committed to supporting science and education. Its research funding priorities are:

1. Investing in scientific progress as a foundation for the future.
2. Strengthening Düsseldorf's regional role.
3. Promoting participation in international research and exchange programs.
4. Supporting young talents in scientific research and professional development.
5. Expanding university–civil society engagement.

Charles University, Prague: Internationalization Strategy

Founded in **1348** by Emperor Charles IV, **Charles University** in Prague (also known as Karlova University) is one of Europe's oldest and most prestigious centers of learning. Created with the counsel of Archbishop Arnošt of Pardubice, the institution—sometimes referred to as the "Imperial University"—emerged during a period marked by crusades and the influence of the Holy Roman Empire.

The university has hosted many notable figures, including **Jan Hus (Czech national hero), Albert Einstein, Nikola Tesla**, and writers such as **Milan Kundera**. **Franz Kafka** completed his doctoral studies in law here under Alfred Weber's supervision.

Today, Charles University ranks among the **world's leading research universities**, known for the quality and relevance of its scientific output, participation in **international projects**, membership in global networks, and extensive involvement in **summer schools, conferences, and exchange programs**.

According to *Times Higher Education World University Rankings*, Charles University is consistently placed among the **top 500 universities worldwide**. In the **Shanghai Ranking (ARWU)**, it holds a position around the **top 200 globally**, ranking **7th among European universities** and **1st in Erasmus Mundus student participation**.

Table 1. Foundations of the Functioning of an Innovative University

Role of Secondary School	Role of University	Role of Industry	Role of the State	Role of NGOs
1. Systematic organization of career-oriented activities in schools. 2. Development of intensive, scientifically grounded cooperation between secondary schools and universities.	1. Organization of innovative activity directions. 2. Conduct of intensive scientific research. 3. Identification of new research areas. 4. Establishment of research structures. 5. Creation of production enterprises. 6. Expansion of international cooperation. 7. Analysis of global political and economic development dynamics. 8. Establishment of techno-parks. 9. Organization of laboratories equipped with modern technologies. 10. Study of the socio-economic demands of	1. Presentation of new projects to universities. 2. Support for equipping universities' material-technical base with modern technologies. 3. Support for establishing cooperation between universities and local/foreign companies. 4. Provision of conditions for practical training and research. 5. Establishment of business accelerators. 6. Establishment of business incubators.	1. Coordination of activities between the Ministry of Education and the Ministry of Economic Development. 2. Allocation of grants and funding programs to universities. 3. Provision of grants for start-up projects. 4. Allocation of preferential loans to projects transforming into businesses.	1. Implementation of joint projects with universities. 2. Conduct of public awareness campaigns. 3. Organization of social surveys.

	society. 11. Ensuring sufficient autonomy for universities. 12. Provision of highly qualified academic staff. 13. Allocation of financial resources for scientific research. 14. Establishment of science–production departments. 15. Development of infrastructure for an innovative environment.			

Internationalization and Academic Structure of Charles University

One of the key directions of Charles University's international engagement is **student and faculty mobility**, including **dual-degree programs**. The university is recognized among Europe's leading institutions for the high quality of its participation in the **Erasmus Mundus program**. At present, Charles University cooperates with more than **200 prestigious universities worldwide**.

Doctoral students also have the opportunity to participate in the **Cotutelle program**, which allows them to conduct research under the joint supervision of two academic advisors. Upon successful defense, graduates receive diplomas from both Charles University and the partner institution. These programs enable students to pursue research in foreign universities and scientific centers.

Currently, Charles University enrolls **nearly 50,000 students**, including around **7,000 international students**. The university consists of **17 faculties, research institutes, teaching centers, and supporting organizations**. The university is governed by the **Rector**, while faculties are headed by **Deans**. Education is offered at the **bachelor's, master's, and doctoral levels**. Charles University is a member of the **European University Association**, alongside Oxford, Sorbonne, Bologna, and Geneva.

- The **Faculty of Catholic Theology**, active since 1348, teaches the history of art and theology.
- The **Faculty of Protestant Theology** prepares students for service in religious and social institutions.
- The **Faculty of Hussite Theology**, established in 1920, focuses on Hussite doctrine, its religious and social dimensions.
- The **Faculty of Law**, one of the oldest, has educated prominent legal and political figures in Czech public life. Teaching is offered only full-time, lasting **five years** and leading directly to a **master's degree**.

Charles University has a particularly rich tradition in **medical education**, with **six faculties of medicine**:

- The **First Faculty of Medicine** (founded in 1215) is one of the oldest centers of medical education in Europe, specializing in physical therapy, intensive care, and dietetics.
- The **Second Faculty of Medicine** focuses on pediatrics.
- The **Third Faculty of Medicine** offers comprehensive training across all medical disciplines, supported by an extensive network of Czech hospitals, institutes, and clinics. It also includes a **Department of Public Health**.
- The **Plzeň Faculty of Medicine** provides master's and doctoral programs.
- The **Hradec Králové Faculty of Medicine** specializes in pharmacy.

The university has gained **global recognition** for research in fields such as **Egyptology, addictology, and criminology**.

The **Faculty of Philosophy** is among the most popular, hosting more than **8,000 students**, many of them international. Lectures are frequently delivered by world-renowned scholars.

Across its **17 faculties**, Charles University offers over **300 accredited programs** at the bachelor's and master's levels, spanning **642 specializations**. Most faculties include affiliated **institutes, research groups, and preparatory courses**.

The **Faculty of Education** reflects distinctive features of Czech teacher training, where students usually specialize in **two teaching subjects** (e.g., English and mathematics; chemistry and biology; history and literature). The faculty offers broad specialization options, including **psychology, pedagogy, and special education**. Admission involves both **tests and interviews**, with oral interviews assessing applicants' motivation and aptitude. For foreign students, a Czech language certificate is not required. The psychology program requires a **written test**, based partly on recommended literature; approximately **15% of the questions are in English**, requiring at least **B2-level proficiency**.

Charles University is also home to numerous specialized **research centers**, including the **Institute of History and Archives, Center for Theoretical Studies, Center for Economic Research and Postgraduate Education, Environmental Center, Computer Science Center, School for Knowledge and Technology Transfer, Institute of Linguistic Studies, Institute of Political Science and International Relations, Institute of Sociology, Institute of Communication and Journalism, European Information Center, and Ecology Center**. Together with its central library, these institutions significantly enhance the university's standing among Europe's top research universities. Their overarching aim is to strengthen Charles University's role as a **research hub**, expand **university–society relations**, and ensure the regular dissemination of research in **scientometric databases**.

The Entrepreneurial and Innovative University Model

The universities examined in this study share a commitment to **innovation** and to the principles of the **"entrepreneurial university."** As innovative institutions, they contribute to the development of **human capital, science and technology, industry, and agriculture**, thus playing a decisive role in the intellectual and economic progress of their respective countries.

Switzerland exemplifies this model. According to *Reuters World's Most Innovative Universities*, the country invests approximately **16 billion Swiss francs annually** in science, education, technology, and innovation. The **Swiss Federal Institute of Technology in Zurich (ETH Zurich)** embodies this strategy. In 1936, its president Arthur Rohn introduced the **"Innovation Policy Program"**, which laid the groundwork for the creation of the **Swiss National Science Foundation in 1942**. ETH Zurich counts **21 Nobel laureates** among its alumni and faculty.

In the past decade, ETH has consistently ranked among the **top five European technical universities** and among the **world's leading institutions**. Its graduates rarely face difficulties finding employment in their fields, reflecting the university's reputation for professional excellence. ETH Zurich's relatively **low tuition fees**, coupled with its heavy investment in **education, teaching quality, and scientific research**, ensure that resources are effectively allocated. Crucially, ETH promotes not only research and teaching but also the **integration of science into industry**, thereby advancing the modern model of the entrepreneurial university. One key indicator of success in this regard is **Industry Income**, representing revenue from non-governmental research and discovery transferred to the commercial sector.

A similar trajectory can be observed at the **Tambov State University named after G.R. Derzhavin (Russia)**, where the shift toward an **innovative education-research model** began in the early 2000s. Its **development strategy** includes:

- Optimizing innovation and investment activity as a factor in regional development.
- Strengthening orientation toward civil society.

- Establishing **innovation technoparks** that integrate education, research, production, and social infrastructure.
- Building the university's **competitive brand**.
- Promoting a **corporate academic culture**.
- Improving education quality and ensuring competitiveness of research.
- Enhancing the university's position in the **international education and research space**.
- Improving living and working conditions for staff and students, including housing provision.
- Expanding the university's role as a **regional ideological and cultural center**.
- Promoting **public education and outreach**.
- Advancing **practice-based education**.

The university's development plan clearly reflects its adoption of **innovation as a core principle**, aligning all activities with the **dynamic needs of modern society**.

As **S.B. Abdygapparova (2010)** notes, the potential for innovative activity in a university must be evaluated through **comprehensive economic analysis**. This involves assessing the university's:

- overall economic performance,
- efficiency of resource use,
- labor and wage structures,
- student performance indicators,
- profitability and revenue,
- financial stability and working capital,
- and effectiveness of economic incentives.

Such an analysis identifies whether sufficient foundations exist for innovative development, and if so, helps determine the scope of **future investment** in university innovation. This approach also supports the creation of a **national innovation ecosystem** and the mobilization of **state innovation resources**.

One of the key factors in the implementation of innovative activities in universities is the scientific personnel potential. This is essential, since it is the staff who regulate and carry out innovation. At the current stage of scientific and technological progress, possessing knowledge alone is not sufficient for academic staff. They must also be able to apply the latest advances in technology to the teaching process, stimulate students' interest, and foster enthusiasm for their chosen field. University personnel are expected to demonstrate flexible thinking, analytical skills, and the ability to make prompt decisions. At the same time, the university must take responsibility for the continuous professional development of its staff.

The creation of an effective management system constitutes a decisive step towards building an innovative university. Such a system, by incorporating science–industry–business relations, paves the way for the establishment of an innovation-friendly environment (Bunyak, 2016). Leaders of universities who seek efficiency in specialist training, research activities, and high-quality production increasingly aim to adopt the globally expanding "entrepreneurial university" model. The integration of entrepreneurial university features into modern higher education institutions represents a major step forward in the pursuit of innovation.

Within this model, the achievement of high results in personnel training is only part of the process. The primary goal is to promote collaboration with industrial enterprises and large corporations, thereby ensuring the commercialization of scientific research. The research activity envisaged in entrepreneurial universities is expected to meet the demands of industry. This concept was initially articulated in the mid-1990s in the works of American scholars B.R. Clark and Peter Drucker, and subsequently developed further by European, Russian, and Ukrainian researchers. The Massachusetts Institute of Technology (MIT), Stanford University, New York University, and a number of European institutions—including those examined in this study—are often cited as classical examples of entrepreneurial universities.

Clark's longitudinal research on five European universities over a ten-year period demonstrated that the entrepreneurial university model constitutes their path towards innovation (Clark, 2011). Adoption of this concept by a university implies readiness for fundamental institutional change. Importantly, Clark emphasized that universities can embrace the entrepreneurial model without compromising their traditional academic values.

According to Professor A.O. Grudzinskiy, Doctor of Sociological Sciences, entrepreneurial universities are systematically engaged in creating knowledge, delivering education, and translating this knowledge into practice. He characterizes entrepreneurial universities as institutions that:

1. Operate with innovation as their central goal, capable of functioning under conditions of risk and dynamic demand.
2. Are economically efficient, primarily relying on their own resources.
3. Possess a flexible and network-based organizational structure.
4. Derive balanced benefits from the skills and risk-taking capacities of individuals and groups.
5. Focus not on controlling or monitoring staff activities, but on fostering an environment that supports the institution's strategic mission.
6. Demonstrate adaptability to changing consumer demands and provide rapid responses (Grudzinskiy, 2004).

In Clark's (2011) view, the transformation of universities into entrepreneurial institutions requires at least five essential elements:

- a strengthened steering core;
- an expanded developmental periphery;
- a diversified funding base;
- a stimulated academic heartland;
- an integrated entrepreneurial culture.

These elements are central to the operational strategies of the universities analyzed in this study. Russian scholars A. Sidorova and N.A. Rumyantsev argue that entrepreneurial universities serve as research centers which, in addition to fulfilling the traditional functions of education and science, effectively transfer knowledge to the practical domains of the economy and society (Zimmermannová, et al. 2022).

S.V. Golubev, in his research, highlights the social mission of entrepreneurial universities, examining their operations through the lens of social entrepreneurship. He stresses that the primary responsibility of such universities lies in the broad implementation of innovative educational programs and the creation of entrepreneurial ecosystems within their respective regions (Golubev, 2004). J. Ropkey adds that entrepreneurial universities must display entrepreneurial behavior institutionally, while also embedding this mindset conceptually (Ropkey, 2004).

Ukrainian scholar N.M. Bunyak (2016) argues that analysis of different approaches to defining the essence of the entrepreneurial university supports the conclusion that its entrepreneurial function is often associated with the commercialization of research outcomes. According to him, entrepreneurial universities:

- diversify their sources of funding;
- reduce institutional dependence on public and governmental structures;
- train specialists with creative thinking capable of implementing innovative projects across different fields;
- generate new knowledge and ensure its capitalization.

Such institutions are characterized by organizational flexibility that allows them to adapt quickly to changing societal and market needs. They actively promote the establishment of new enterprises by faculty and students to commercialize research outcomes, facilitate the entire cycle of knowledge creation—from idea generation to

prototyping innovations—and encourage the integration of education, science, and business. Collectively, these features contribute to the creation of initial conditions necessary for the innovative development of the national economy (Bunyak, 2016).

Conclusion

Although some efforts have been made in contemporary Azerbaijan and in universities of the former Soviet republics to implement entrepreneurial functions, these initiatives have not yet been fully realized across a wide spectrum. Several factors contribute to this. Most universities prioritize personnel training over research activities, often concluding the process solely with teaching, without encouraging students to engage in scientific and creative work. This trend is particularly evident in state universities. Another challenge is the underdevelopment of an innovative educational and work environment. Factors hindering progress include insufficient connections between universities and business structures, corporations, leading global universities, research centers, and society at large.

The absence of an entrepreneurial culture and the lack of entrepreneurial experience among faculty further hinder the emergence of an entrepreneurial university tradition in the post-Soviet space. Consequently, students often become passive, focusing solely on obtaining their diplomas and securing employment, rather than keeping pace with the modern trends in industrial development, technology, and science. Personnel who do not meet the demands of the contemporary world cannot contribute to the advancement of science, industry, or technology.

The entrepreneurial university integrates teaching, research, and entrepreneurial activities, generating revenue from these functions while also serving as a critical participant in the country's innovation processes. Such universities not only train innovative-minded specialists for various fields but also produce new knowledge and commercialize it. By providing students with deep theoretical knowledge alongside the development of fundamental research skills, intellectual stimulation through teaching and research, and opportunities to acquire practical skills aligned with personal professional needs, universities actively prepare graduates for the workforce. In other words, the university participates directly in innovation activities and scientific production at both macro and micro levels.

The entrepreneurial university pursues two key objectives:

1. To train specialists for students wishing to establish their own businesses, offering and implementing entrepreneurship programs that develop students' entrepreneurial mindset.
2. To engage students and graduates in entrepreneurial activities through the establishment of business incubators, technology parks, and similar initiatives, thereby assisting them in founding their own companies and functioning as an entrepreneurial institution.

In the universities examined in this study, these factors were identified as particularly significant. Operating at the level of contemporary demands opens pathways to innovation and lays the foundation for new prospects for these higher education institutions. The findings suggest that the entrepreneurial university not only conducts training and research in business and other socio-economic fields but also facilitates significant financial investments from large corporations and governments, and generates revenue from its own entrepreneurial activities.

The development of university entrepreneurship is supported by initiatives such as the 2003 Gelsenkirchen Institutional Entrepreneurship Declaration, which is recognized as a key step for promoting entrepreneurship education in European higher education systems. The declaration emphasizes that the entrepreneurial university concept entails appropriate institutionalization of university management structures and activities, characterized by:

- Professionalization of university management and staff, establishing strong executive leadership;
- Diversification of income sources;

- Careful attention to core academic values while studying and integrating new market management methods;
- Close engagement with the business world and society;
- Promotion of initiative and an innovative entrepreneurial culture, including knowledge transfer, establishment of new production companies, continuation of education, alumni relations, and attracting financial resources;
- Integration of academic and research divisions beyond traditional boundaries, and preparation of projects aligned with new knowledge production methods.

The realization of this concept requires scientifically grounded, forward-looking, and fundamental activity.

Conflict of Interest

The author declares no conflict of interest regarding the publication of this manuscript.

Keywords Quality, Pedagogical Practice, University, Improvement Requirements.

Abstract
This study aims to examine the current state of the quality of pedagogical practice in Algerian universities and to identify the requirements for its improvement. The research sample consisted of 65 faculty members from various disciplines. A descriptive statistical approach was adopted, and a questionnaire was designed and validated through review by a panel of experts. Reliability and suitability for application were confirmed through a pilot study.
The findings of the study revealed the following:
- The quality of pedagogical practice and the requirements for its improvement at the Faculty of Social, Human, and Islamic Sciences, Ahmed Draïa University – Adrar, were found to be at a moderate level.
- There are statistically significant differences in the requirements for implementing quality pedagogical practice at the Faculty, based on variables such as gender, age, academic qualification, rank, years of experience, and field of specialization.

Introduction:

The university is an educational and instructional institution that strives to achieve multiple objectives in the academic and research fields, granting it a vital role in scientific and technological progress through the research it produces in various disciplines. In light of the technological revolution, there has been a growing need to develop all elements of the educational system, an effort that has become a global priority.

Today, the quality of higher education stands as one of the most pressing challenges facing educational systems in developing countries. Reports from international organizations emphasize the necessity of rethinking the philosophy of university education, focusing on the establishment of enhanced standards to ensure the quality of educational outcomes (Zerqan Leila, 2012, p. 1).

The success of the educational process in achieving its goals largely depends on the quality of pedagogical practice and the instructor's mastery of diverse teaching skills in light of modern instructional roles. This contributes to raising the efficiency of the educational system and improving the quality of educational outputs.

Pedagogical practice is among the most important and effective functions of education in preparing qualified graduates, as it equips them with the necessary theoretical knowledge and practical skills. Given the significance of university teaching, many researchers have sought to identify the most effective teaching methods that university instructors can adopt. Research findings indicate that effective teaching is often accompanied by specific academic and psychological behaviors, such as the instructor's enthusiasm for teaching, breadth of knowledge, mastery of the subject matter, ability to organize and present content engagingly, clarity in delivering information, commitment to each student's cognitive and behavioral development, and capacity to motivate and gain students' trust and respect (Zerqan Leila, 2012, p. 2).

Pedagogical practice is therefore a cornerstone for enhancing teaching quality and achieving excellence in outcomes, especially amid intense competition between higher education institutions in today's era of globalization, characterized by massive knowledge and technological advances as well as diverse modern teaching approaches using information and communication technology. Consequently, higher education institutions must create the conditions to improve faculty performance through continuous assessment, enhancement, and development—efforts that positively impact the quality of the institution and its outputs.

In higher education systems, the quality of pedagogical practice is a top priority for all nations and educational institutions that award academic degrees and ranks, with the aim of producing graduates who are competitive and successful in the global job market and capable of meeting society's needs for sustainable development in all dimensions: human, social, economic, and cultural.

1. Research Problem:

Higher education institutions are placing increasing emphasis on the quality of their educational services as they face a competitive environment and rising societal demands for graduates capable of meeting local needs effectively. The quality of services provided by these institutions is reflected in the performance of their graduates in the labor market and shapes the perception of the community and employers toward the institution. Faculty members play a key role in translating institutional plans and objectives into tangible outcomes, which ultimately shape the reputation of both the graduates and the university itself.

Accordingly, there is a pressing need to develop a proposed framework for evaluating pedagogical practice within these institutions as part of their comprehensive quality management process.

This study emerged from the following main questions:

- What is the current state of the quality of pedagogical practice at the Faculty of Social, Human, and Islamic Sciences, Ahmed Draïa University – Adrar?
- Are there statistically significant differences in the requirements for implementing quality pedagogical practice at the Faculty based on gender, age, academic qualification, rank, years of experience, and field of specialization?
- From these, the following sub-questions arise:
- Are there statistically significant differences in the requirements for implementing quality pedagogical practice at the Faculty based on gender?
- Are there statistically significant differences based on age?
- Are there statistically significant differences based on academic qualification?

- Are there statistically significant differences based on academic rank?
- Are there statistically significant differences based on years of experience?
- Are there statistically significant differences based on field of specialization?

Research Hypotheses:

Based on the research problem and the preceding questions, a set of hypotheses was formulated for verification, as follows:

- The quality of pedagogical practice and the requirements for its improvement at the Faculty of Social, Human, and Islamic Sciences, Ahmed Draïa University – Adrar, are at a moderate level.
- There are statistically significant differences in the requirements for implementing quality pedagogical practice at the Faculty based on gender, age, academic qualification, rank, years of experience, and field of specialization.

From these, the following sub-hypotheses are derived:

- There are statistically significant differences in the requirements for implementing quality pedagogical practice at the Faculty based on gender.
- There are statistically significant differences based on age.
- There are statistically significant differences based on academic qualification.
- There are statistically significant differences based on academic rank.
- There are statistically significant differences based on years of experience.
- There are statistically significant differences based on field of specialization.

3. Significance of the Study:

The significance of this study can be summarized as follows:

- It addresses the topic of the quality of pedagogical practice in higher education in Algeria—a subject that, to the researcher's knowledge, has not received sufficient attention in previous research. University libraries lack studies of this nature, and it is hoped that this work will serve as a starting point for further research in this field.
- The current era, known as the "Age of Knowledge," is witnessing a widespread culture of quality. Accordingly, it is essential to explore models of quality in higher education, including the quality of pedagogical practice and the requirements for its improvement.
- The necessity of elevating Algerian universities to higher levels of pedagogical quality, overcoming obstacles that hinder the achievement of their goals, and fulfilling their civilizational mission of producing and disseminating knowledge.
- The study contributes to understanding the roles of university instructors within the pedagogical process, particularly in terms of design, guidance, and facilitation, to improve the quality of education and better meet students' needs in alignment with established educational objectives, while also informing the development of relevant educational policies.
- The study has practical significance in that its findings will provide an understanding of the reality of pedagogical practice at the Faculty of Social, Human, and Islamic Sciences, Ahmed Draïa University – Adrar, along with recommendations that may inspire further research and debate.

4. Objectives of the Study:

This study seeks to achieve the following objectives:

- To identify the current state of the quality of pedagogical practice and the requirements for its improvement at Ahmed Draïa University – Adrar.
- To determine the differences in the requirements for implementing quality pedagogical practice at the Faculty based on gender, age, academic qualification, rank, years of experience, and field of specialization.

5. Operational Definitions Quality:

In education, quality refers to the process of applying a set of academic and instructional standards necessary to raise the quality of the educational product through the efforts of all members of an institution, across all aspects of educational work.

In educational contexts, quality encompasses the set of characteristics and attributes that accurately and comprehensively express the essence and condition of education, including all its dimensions inputs, processes, outputs, feedback and the continuous interactions that lead to the achievement of desired goals.

Operational definition: Improving the educational process in all its dimensions.

Pedagogical Practice:

The evaluation of the teaching process at the Faculty of Social, Human, and Islamic Sciences, Ahmed Draïa University – Adrar. It refers to the set of instructional content and activities delivered by university faculty members in accordance with higher education quality standards.

University:

An organized academic and educational institution at the top of the educational hierarchy in society, responsible for preparing individuals professionally, in addition to conducting scientific research that serves comprehensive development plans and training researchers for the public good (Conference of Arab Ministers Responsible for Higher Education, 1983, p. 10).

It is also a place where the processes of knowledge development and community service intersect with the need for qualified graduates (Alain Touraine, 1974, p. 591).

Operational definition: An educational and instructional institution that performs multiple functions aimed at achieving comprehensive development, including teaching, scientific research, and community service through the preparation, training, and qualification of individuals for the university educational process.

Improvement Requirements:

The process of enhancing and optimizing the implementation of measures to improve teaching performance, moving from less effective to more effective practices, by assessing the quality of this process in accordance with the quality standards of the Faculty of Social, Human, and Islamic Sciences, Ahmed Draïa University – Adrar.

5. Methodological Procedures of the Study:

5.1 Research Method:

Given the nature of the study and its objectives—to examine the quality of pedagogical practice in Algerian universities and the requirements for applying comprehensive quality at the Faculty of Social, Human, and Islamic Sciences, Ahmed Draïa University – Adrar, with respect to gender, age, academic qualification, rank, years of experience, and specialization—the researcher adopted a descriptive method based on a quantitative statistical approach. This method determines the current state of the phenomenon under investigation and provides a descriptive report on it (Abdel Rahman Addas, 1993, p. 17). It aims to describe the phenomenon, gather facts and observations, report its actual status, and include analysis, interpretation, and the identification of relationships between variables.

5.2 Temporal and Spatial Scope of the Study:

The study was conducted from February 5, 2023, to February 19, 2023, at the Faculty of Social, Human, and Islamic Sciences, Ahmed Draïa University – Adrar, covering the following departments:

- Department of Human Sciences.
- Department of Social Sciences.
- Department of Islamic Sciences.

5.3 Study Population and Sampling Method:

a. Study Population:

The population of this study consisted of permanent faculty members at the Faculty of Social, Human, and Islamic Sciences, Ahmed Draïa University – Adrar, during the 2022–2023 academic year.

b. Sampling Method:

A random sampling technique was used to select participants from the total population of permanent faculty members at the Faculty, resulting in a sample of 65 faculty members.

c. Sample Characteristics:

- **Distribution by Gender:**

The sample consisted of 65 faculty members from the Faculty of Social, Human, and Islamic Sciences, Ahmed Draïa University – Adrar, distributed as shown in the following table:

Table (01): Distribution of the Study Sample According to Gender

female		male		total
percentage %	number	percentage%	number	65
40%	26	60%	39	

From Table (01), the distribution of the study sample by gender shows that males represent 60% of the total sample, while females account for 40%. This indicates that the proportion of males is higher than that of females.

Distribution of the Study Sample by Age:

The ages of the participants in the study sample range from 28 years to 50 years and above, distributed as shown in the following table:

Table (02): Distribution of the Study Sample According to Age

Age range	frequency	% Percentage
28 – 37 years	21	32%
38 – 47 years	24	36%
48 years and above	20	30%
Total	**65**	**100%**

From Table (02), the distribution of the study sample by age indicates that 32% of the faculty members are between 28 and 37 years old, 36% are between 38 and 47 years old, and 30% are aged 48 years and above. These percentages are relatively close to one another.

Distribution of the Study Sample by Academic Qualification:

The study sample is divided, in terms of academic qualification, into faculty members holding doctoral and master's degrees, distributed as shown in the following table:

Table (03): Distribution of the Study Sample According to Academic Qualification

Academic qualification	frequency	percentage%
doctorate	37	56%
Master's degree	28	43%
total	**65**	**100%**

From Table (03), the distribution of the study sample by academic qualification shows that 56% of the faculty members hold a doctoral degree, while 43% hold a master's degree.

Distribution of the Study Sample by Academic Rank:

The distribution of the study sample according to academic rank is presented in the following table:

Table (04): Distribution of the Study Sample According to Academic Rank

Academic rank	frequency	percentage%
Professor of Higher Education	15	23%
Associate Professor	12	18%
Lecturer	20	30%
Assistant Professor	18	27%
total	**65**	**100%**

From Table (04), the distribution of the study sample by academic rank indicates that 23% of the faculty members hold the rank of Professor of Higher Education, 18% hold the rank of Associate Professor the lowest proportion while 30% are Lecturers and 27% are Assistant Professors.

Distribution of the Study Sample by Years of Experience:

The distribution of the study sample according to years of experience is shown in the following table:

Table (05): Distribution of the Study Sample According to Years of Experience

Years of Experience	frequency	percentage%
Less than 5 years	18	27%
5 to 10 years	16	24%
11 to 20 years	16	23%
21 to 30 years	10	15%
More than 30 years	6	9%

Total	**65**	**100%**

From Table (05), the distribution of the study sample by years of experience shows that 27% of the faculty members have less than 5 years of experience, 24% have between 5 and 10 years, and 23% have between 11 and 20 years of experience. Furthermore, 15% have between 21 and 30 years of experience, while only 9%—the smallest proportion have more than 30 years of experience.

Distribution of the Study Sample by Field of Specialization:

The study sample is distributed across the following specializations: Sociology, Psychology, History, Media and Communication, and Islamic Sciences, as presented in the following table:

Table (06): Distribution of the Study Sample According to Specialization.

Specialization	frequency	Percentage%
Sociology	15	23%
Psychology	12	18%
History	14	21%
Media and Communication	09	13%
Islamic Sciences	15	23%
Total	**65**	**100%**

From Table (06), the distribution of the study sample by specialization indicates that 23% of the faculty members specialize in Sociology, 18% in Psychology, and 21% in History. Additionally, 13% specialize in Media and Communication, while 23% specialize in Islamic Sciences.

6. Study Tool and Its Specifications:

The study tool consisted of a questionnaire, which was developed after reviewing the relevant literature. It contained 20 items distributed across two dimensions and employed a dichotomous response scale ("Yes–No"). The questionnaire was then presented to a panel of seven (07) expert faculty members in the relevant field for validation.

7. Psychometric Properties of the Study Tool:

7.1 Validity of the Research Tool:

a. Expert Validity:

To ensure the validity of the research tool, the questionnaire was reviewed by a group of expert faculty members with relevant experience, to assess the clarity and appropriateness of the items from both pedagogical and linguistic perspectives. The experts evaluated the relevance of each item to the dimension it was intended to measure, and suggested modifications, deletions, or additions where necessary.

b. Intrinsic Validity:

Intrinsic validity was calculated by taking the square root of the reliability coefficient $\sqrt{0,98}$ .The intrinsic validity coefficient for the questionnaire was found to be 0.98, indicating a high degree of validity.

7.2 Reliability of the Research Tool:

The reliability coefficient for the questionnaire was calculated using the split-half method. The questionnaire was divided into two halves: the first half included odd-numbered items (X) from 1 to 19, and the second half included even-numbered items (Y) from 2 to 20. After administering the questionnaire, each participant obtained two separate scores—one for the odd items and one for the even items. Pearson's correlation coefficient between the two sets of scores was found to be **r = 0.79**.

To further verify this result and reduce the effect of guessing, the Spearman–Brown prophecy formula was applied, yielding a corrected reliability coefficient of

y r = 0.98, which is sufficient to indicate a high level of reliability.

Presentation and Discussion of Results:

- **Presentation and discussion of the first hypothesis,** which states that the reality of the quality of pedagogical practice and the requirements for its improvement at the Algerian university, specifically at the Faculty of Human, Social, and Islamic Sciences at Ahmed Draïa University in Adrar, is at an average level.

  To verify this hypothesis, percentages were calculated based on the responses of the sample individuals according to the faculty's departments, and the following table illustrates this:

Table (07): shows the percentages according to the responses of the sample individuals by the faculty departments.

Dimension	Department of Human Sciences		Department of Sociology		Department of Islamic Sciences	Level
	Percentage %	Level	Percentage %	Level	Percentage %	
Quality of Pedagogical Practice	50.22%	Average	43.14%	Average	45.65%	Average
Improvement Requirements	40.32%	Average	16.82%	Low	32.55%	Average
Total	90.54%	Average	52.96%	Average	78.20%	Average

It appears from the above table, which illustrates the percentages of the sample responses to the questionnaire items at the level of each department included in this field study, that the percentage for the dimension of the quality of pedagogical practice among the sample of the Department of Human Sciences was 50.22% at an average level, while in the dimension of improvement requirements it was 40.32% at an average level. For the sample of the Department of Sociology, the percentage for the quality of pedagogical practice was 43.14% at an average level, while in the dimension of improvement requirements it was 16.82% at a low level. As for the sample of the Department of Islamic Sciences, the percentage for the quality of pedagogical practice was 45.65% at an average level, while in the dimension of improvement requirements it was 32.55% at an average level.

This result can be interpreted as reflecting that the reality of the quality of pedagogical practice is relatively similar in its level across the three departments, where the percentages remained within the average level, which supports the validity of the hypothesis. Moreover, the evaluation of the improvement requirements was at an average level in most departments, except for the Department of Sociology, which showed a low evaluation of the improvement requirements. This may reflect the existence of challenges or a lack of awareness regarding the need to develop certain pedagogical aspects, or perhaps a weakness in the presence of clear plans to improve quality within this department in particular.

These percentages reflect a relative awareness among faculty members and stakeholders in the educational process of the importance of the quality of pedagogical performance. At the same time, however, they highlight the need for further efforts to improve and develop these practices beyond the average level toward a higher level of quality and effectiveness.

Accordingly, the results emphasize the importance of strengthening a culture of pedagogical quality within the departments, through the provision of training programs, workshops, and regular evaluative follow-up, in order to ensure the transition from the average level to a higher and more integrated level of pedagogical performance within the university.

- **Presentation of the second hypothesis,** which states that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human, Social, and Islamic Sciences at Ahmed Draïa University in Adrar according to the variables of gender, age, academic qualification, rank, years of experience, and specialization.
- **Presentation of the first sub-hypothesis,** which states that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human, Social, and Islamic Sciences at Ahmed Draïa University in Adrar according to the variable of gender.

Table (08): Significance of differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the gender variable.

Dimension	Males		Females		T-value	Significance Level
	Mean	SD	Mean	SD		
Quality of Pedagogical Practice	8.23	0.21	8.43	0.35	0.67	0.05
Improvement Requirements	8.59	0.33	7.54	0.20	0.54	0.05
Total	16.82	0.54	15.97	0.55		

It is evident from the previous table that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the gender variable. Female respondents recorded a higher mean in the dimension of the quality of pedagogical practice, estimated at 8.43 with a standard deviation of 0.35, while the calculated *t*-value reached 70.6 at a significance level of **0.05**, which is statistically significant. This indicates the presence of significant differences between males and females in this dimension, pointing to their positive perception of the level of pedagogical performance. This also reflects a greater awareness among males of the need to develop teaching performance and improve certain aspects related to the quality of practice.

On the other hand, males recorded a higher mean in the dimension of improvement requirements, estimated at 8.59 with a standard deviation of 0.33, while the *t*-value reached 0.54 at a significance level of **0.05**, which is statistically significant. This highlights a difference in perception between males and females.

This result can be interpreted to mean that gender represents a variable with a significant influence on faculty members' perception of the level of quality and the requirements for its improvement. This may be attributed to differences in professional experiences, expectations from the educational environment, or the degree of engagement in teaching, planning, and quality-related tasks. Accordingly, it is recommended that this variable be taken into account when designing programs aimed at improving pedagogical performance, to ensure that the needs of all groups are met.

- **Presentation of the second sub-hypothesis,** which states that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the variable of age.

Table (09): Significance of differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the age variable.

Dimension	Source of Variation	df	Sum of Squares	Mean Squares	F-value	Significance
Quality of Pedagogical Practice	Between groups	2	2.821	12.644	2.57	Significant at 0.05
	Within groups	62	102.079	3.269		
	Total	64	104.9			
Improvement Requirements	Between groups	2	3.453	5.351	3.96	Significant at 0.05
	Within groups	62	120.45	1.342		
	Total	64	123.453			

It is evident from the previous table that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the age variable. The *F*-value in the dimension of the quality of pedagogical practice was 2.572 at a significance level of 0.05 with degrees of freedom (2–62), which is statistically significant. This indicates the presence of significant differences among the different age groups in their assessment of the quality of pedagogical practice. Moreover, the *F*-value in the dimension of improvement requirements reached 3.96 at the same level of significance, which also confirms the presence of significant differences among the age groups regarding the requirements for improving the quality of pedagogical practice.

These results suggest that age represents an influential factor in the respondents' evaluations of the quality of pedagogical practice and its requirements. This may be attributed to variations in knowledge backgrounds and educational experiences among the different age groups. It may also reflect differences in perceptions regarding teaching methods and their alignment with modern standards in higher education. It is possible that the younger age group is more open to innovative teaching approaches or to improving pedagogical performance compared to the older groups.

- **Presentation of the third sub-hypothesis,** which states that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the academic qualification variable.

Table (10): Significance of differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the academic qualification variable.

Dimension	Source of Variation	df	Sum of Squares	Mean Squares	F-value	Significance
Quality of Pedagogical Practice	Between groups	1	4.281	10.265	2.85	Significant at 0.05
	Within groups	63	102.54	3.387		
	Total	64	106.821			
Improvement	Between groups	1	4.834	11.512		
	Within groups	63	112.32	3.569		

Requirements	Total	64	117.154		3.43	Significant at 0.05

It is evident from the previous table that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the academic qualification variable. The *F*-value in the dimension of the quality of pedagogical practice was 2.85 at a significance level of 0.05 with degrees of freedom (1–63), which indicates a significant difference between the two groups in terms of academic qualification in their assessment of pedagogical quality. Moreover, the *F*-value in the dimension of improvement requirements was 3.43 at the same level of significance and degrees of freedom, which confirms the existence of significant differences in the evaluation of the requirements for improving pedagogical quality between holders of different academic qualifications.

This result can be interpreted to mean that academic qualification is an influential factor in individuals' perceptions of the quality of pedagogical practice and its requirements. Academic qualification may reflect differences in the level of knowledge, experience, and expectations regarding the application of quality standards in the educational process. Therefore, these differences necessitate the consideration of diversifying training programs and workshops to suit the different levels of academic qualification, thereby contributing to raising the quality of pedagogical practice more effectively.

- **Presentation of the fourth sub-hypothesis,** which states that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the academic rank variable.

Table (11): Significance of differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the academic rank variable.

Dimension	Source of Variation	df	Sum of Squares	Mean Squares	F-value	Significance
Quality of Pedagogical Practice	Between groups	3	5.487	13.302	4.31	Significant at 0.05
	Within groups	61	123.76	4.473		
	Total	64	154.94			
Improvement Requirements	Between groups	3	4.159	15.653	5.58	Significant at 0.05
	Within groups	61	129.247	3.987		
	Total	64	159.099			

The results of testing the fourth sub-hypothesis revealed statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the variable of academic rank. The *F*-value in the dimension of the quality of pedagogical practice was 4.31 at a significance level of **0.05** with degrees of freedom (3–61), indicating a significant difference among the different categories of academic rank in their assessment of pedagogical quality. Moreover, the *F*-value in the dimension of improvement requirements was 5.58 at the same level of significance and degrees of freedom, which confirms the presence of significant differences in the evaluation of the requirements for improving pedagogical quality among different academic ranks.

This result can be interpreted to mean that academic rank is an influential factor in individuals' perceptions of the quality of pedagogical practice and its requirements. It may reflect differences in experience, responsibilities, and expectations associated with each rank, as well as the level of involvement in the educational process among individuals of different ranks. Therefore, it is recommended that these differences be taken into account when designing targeted professional development programs that suit the needs of various ranks, with the aim of enhancing pedagogical practice quality comprehensively.

- **Presentation of the fifth sub-hypothesis,** which states that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the variable of years of experience.

Table (12): Significance of differences in the requirements for applying the quality of pedagogical practice at the Faculty of Human and Social Sciences at Ahmed Draïa University in Adrar according to the variable of years of experience.

Dimension	Source of Variation	Degrees of Freedom	Sum of Squares	Mean Squares	F Value	Significance
Quality of Pedagogical Practice	Between Groups	4	6.459	15.439	5.34	Significant at 0.05
	Within Groups	60	104.900	3.395		
	Total	64	111.359			
Improvement Requirements	Between Groups	4	4.912	11.725	5.76	Significant at 0.05
	Within Groups	60	121.458	5.203		
	Total	64	126.37			

It is evident from the previous table that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Humanities and Social Sciences, Ahmed Draïa University in Adrar, according to the variable of years of experience. The calculated value of the F-test for the dimension of pedagogical practice quality reached 5.34 at a significance level of 0.05 and degrees of freedom (4–60), which indicates the existence of a significant difference among the different categories in terms of years of experience in evaluating the quality of practice. Likewise, the F value for the dimension of improvement requirements reached 5.76 at the same level of significance and degrees of freedom, which confirms the presence of significant differences in the evaluation of requirements for improving the quality of practice among the different categories of years of experience.

This result can be interpreted as showing that years of experience constitute an influential factor in individuals' perceptions of the quality of pedagogical practice and its requirements, as those with greater experience are more likely to possess a deeper understanding of the strengths and weaknesses in pedagogical performance, which in turn affects their expectations and needs regarding improvement and development.

Presentation of the sixth sub-hypothesis, which states that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Humanities and Social Sciences, Ahmed Draïa University in Adrar, according to the variable of specialization.

Table No. (13): Shows the significance of the differences in the requirements for applying the quality of pedagogical practice at the Faculty of Humanities and Social Sciences, Ahmed Draïa University in Adrar, according to the variable of specialization.

Dimension	Source of Variation	Degrees of Freedom	Sum of Squares	Mean Squares	F Value	Significance
Quality of Pedagogical Practice	Between Groups	4	5.112	14.387	5.11	Significant at 0.05
	Within Groups	60	105.150	4.566		

	Total	64	110.262			
Improvement Requirements	Between Groups	4	4.342	12.187	6.42	Significant at 0.05
	Within Groups	60	122.523	6.523		
	Total	64	126.865			

It is evident from the previous table that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Humanities and Social Sciences, Ahmed Draïa University in Adrar, according to the variable of specialization. The F value for the dimension of pedagogical practice quality reached 5.11 at the significance level of 0.05 with degrees of freedom (4–60), which indicates the existence of a significant difference among the various specializations in the evaluation of quality of practice. Likewise, the F value for the dimension of improvement requirements reached 6.42 at the same level of significance and degrees of freedom, which confirms the presence of significant differences in the evaluation of requirements for improving the quality of practice among the different specializations.

This result can be interpreted to mean that specialization constitutes an influential factor in individuals' perceptions regarding the quality of pedagogical practice and its requirements, since the nature of curricula and the required skills vary across specializations, which in turn is reflected in the diversity of needs and standards related to quality. Accordingly, it is recommended to take into account specialization-related differences when designing strategies for improving the quality of practice, in order to ensure that they are aligned with the specificities of each field of study.

Conclusion:

Finally, and as a summary of the results reached in this study, it can be stated that all hypotheses were statistically significant, as summarized below:

- Beginning with the first hypothesis, which stated that the reality of the quality of pedagogical practice and the requirements for its improvement in the Algerian university, specifically at the Faculty of Humanities, Social Sciences, and Islamic Studies at Ahmed Draïa University in Adrar, is at a moderate level, the results confirmed the validity of this hypothesis.
- As for the second hypothesis, which stated that there are statistically significant differences in the requirements for applying the quality of pedagogical practice at the Faculty of Humanities and Social Sciences, Ahmed Draïa University in Adrar, according to the variables of gender, age, academic qualification, rank, years of experience, and specialization, the results confirmed its validity, with some studies supporting it while others contradicted it.

Study Recommendations:

Based on the results of the present study, the following recommendations can be made:

- Develop university education in Algeria in light of managing the quality of pedagogical practice.
- Ensure that faculty members and administrative staff, regardless of their rank, receive training in modern management methods and tools that keep pace with ongoing developments—especially in matters related to distance education and assessment—through regular training sessions and workshops.
- Design a system for evaluating the quality of teaching and scientific research, involving students and colleagues in performance evaluation according to clear organizational procedures.
- Organize training sessions and conferences for stakeholders in the university educational process on the quality of pedagogical practice and promote its culture within university communities.
- Update curricula adopted under the L.M.D. system in line with the standards and requirements of employment.

- Conduct studies addressing the quality of pedagogical practice and the requirements for its improvement in other Algerian universities.
- Conduct studies comparing the quality of pedagogical practice and the requirements for its improvement in Algerian universities with those in foreign universities.

Keywords Maghreb legislations, custody, housing, visitation rights, child.

Abstract
This study addresses a topic of considerable sensitivity due to its close connection to the family and society, particularly within the framework of Maghreb legislations—namely, child custody. Custody is a fundmental matter with both legal and religious dimensions, as affirmed by Maghreb legislations in their regulation of custody in accordance with Islamic legal principles. Among the primary rights accorded to the child under custody are the right to housing, visitation rights, and the right to nursing. In their pursuit of protecting the best interests of the child, Moroccan lawmakers have enacted specific provisions governing custody, recognizing its central impact on the family unit and the wider society.

Introduction

Marriage is a consensual contract between a man and a woman, founded on mutual affection and compassion, with the aim of establishing a family. Divorce, along with its resulting consequences, has long been a major concern for legislators—particularly in the Maghreb context—as well as for researchers seeking alternative means to mitigate its negative impact, especially on children under custody.

While custody is one of the legal consequences of divorce, it also reflects the attention that Maghreb

legislations devote to the protection of children, a responsibility that is traditionally entrusted to women. This is codified in Algerian law under Ordinance 05-02 amending and supplementing Law 84-11, and in Morocco within the first chapter of the second section of the Moroccan Family Code.

The comparative study of custody in Algerian and Moroccan law is justified by their shared legal and religious foundations, which recognize the right of a divorced mother to custody and regulate its associated provisions. It is also supported by the social similarities between the two countries, notwithstanding certain differences in substantive and procedural rules, and consequently in each legislature's approach to determining the custodial rights of divorced mothers.

This study is guided by a central question: *How effective is the custody framework in each country in protecting the rights of children under custody in Algeria and Morocco?* From this main question arise two subsidiary questions:

- Have Algerian and Moroccan legislators succeeded in safeguarding the divorced mother's right to custody of her children?
- To what extent are the existing legal frameworks sufficient to protect the rights of the child under custody in both jurisdictions?

The objective of this research is to present a comprehensive examination of custody provisions in order to identify shortcomings and highlight the strengths of each legal system. The study proceeds from the understanding that awarding custody to either parent produces specific consequences—some of an entitlement nature (Part One) and others of a compensatory nature (Part Two).

Part One: Custody-Related Effects of an Entitlement Nature

Custody is one of the most significant matters relating to children's rights, encompassing their upbringing, protection, care, and both material and moral support. Custody provisions are an expression of the Islamic legal system's deep concern for childhood, which further elevates the importance and value of custody in society. For this reason, Maghreb legislations—within the scope of this study—have adopted a range of provisions ensuring the protection and welfare of the child under custody.

Section One: The Right to Visit the Child in Islamic Jurisprudence

When parents divorce, the child remains in the custody of one parent to the exclusion of the other. In such cases, the non-custodial parent is granted the right to visit the child. This right serves not only to ensure material care but also to secure the moral and emotional well-being of the child. Visitation, as recognized in Islamic jurisprudence, is therefore a right owed to the non-custodial parent and, more importantly, a right that exists for the benefit of the child.

A. The Concept of Visitation in Language and Legal Terminology

The highest form of a child's upbringing is achieved when both parents are present to provide care and affection. However, when the parents separate, custody is granted to the parent deemed most capable of serving the child's best interests. Even so, neither parent may prevent the other from visiting or seeing the child. On this basis, it is essential to clarify the linguistic and juristic meanings of the term *visitation*.

a) Definition of Visitation in Linguistic and Juridical Usage

1. Linguistic Definition

The term *ziyārah* (زيارة, visitation) derives from the verb *zāra* (زار), meaning *to visit*. In Arabic usage, it refers to the act of going to see someone, such as in the expressions: *zārahu ziyārah* or *zuwārah*, and also *izdārahu*, which similarly conveys the act of visiting. (Ibn Manzur, p. 355)

The word *zār* also denotes "visitors," as in the expressions *rajul zā'ir* (a visiting man) and *qawm zār* (a group of visitors), with *zār* being the feminine plural form. (Al-Jawhari, 1990, p. 417)

2. Juridical Definition

In Islamic jurisprudence, visitation is defined as the act of meeting the child under custody and inquiring into his or her living, educational, moral, and health conditions, within the same environment where the child resides. Jurists have expressed the notion of visitation through various synonymous terms, such as *seeing one's child*, *observing the child's well-being*, and *maintaining personal contact and care*. (Al-Zu'nani, n.d, p. 39)

b) Definition of Visitation in Maghreb Legislations

The Algerian legislator addressed visitation rights in Article 64 of the Algerian Family Code, which provides: *"When awarding custody, the judge must also rule on visitation rights."* Accordingly, the Algerian legislator neither defined the concept of visitation nor clarified its purpose or underlying rationale. Instead, the law merely obliges the judge, when granting custody, to also grant visitation rights. Furthermore, the legislator did not regulate the modalities of visitation, leaving such matters to the discretion of the judge pursuant to Article 222 of the Algerian Family Code.

In contrast, the Moroccan legislator addressed visitation in Article 180 of the Moroccan Family Code,[·] which stipulates: *"The non-custodial parent has the right to visit and host the child."* Like Algerian law, Moroccan law provides no precise definition of visitation nor specifies its objectives. However, it differs in that it extends visitation rights to grandparents — specifically, to the parents of the deceased parent — provided that one of the child's parents is deceased. In such cases, only the parents of the deceased parent may visit or host the child.

B. Legitimacy of the Right to Visitation in Maghreb Legislations

Maghreb family laws expressly recognize the legitimacy of visitation rights for the non-custodial parent, as reflected in a series of statutory provisions governing this right.

In Algeria, as provided in the second paragraph of Article 64 cited above, the judge — when granting divorce — is required, if custody is awarded to the mother or another person, to also grant visitation rights to the other parent. The judgment must specify the times and locations for exercising visitation. This right goes beyond merely seeing the child; it also encompasses monitoring the child's welfare, ensuring his or her proper care, and strengthening the relationship between the child and the non-custodial parent. Visitation rights are not subject to the personal whims of either the custodial or non-custodial parent; rather, they are a binding legal obligation regulated by the court at the time custody is granted, with the child's best interests as

[·] . Law No. 03/70, enacted by Royal Decree No. 22/4/01, dated 03/02/2004, (*Official Gazette*, No. 5184, concerning the Moroccan Personal Status Code).

the guiding principle.

As for Morocco, the legitimacy of visitation rights is established not only through statutory recognition but also through detailed procedural safeguards. Articles 180 to 186 of the Moroccan Family Code (Shafi'i, 1995, p. 231) set out rules for visitation and grant judges discretionary authority to ensure proper regulation and enforcement. The Moroccan legislator provides for visitation either through mutual agreement between the parents or, in the event of disagreement, through judicial intervention. The court specifies and regulates visitation in detail within the custody award judgment.

C. Abuse of the Right to Visit the Child

Jurists unanimously agree that parents have the right to see their child under custody and that it is impermissible to prevent either of them from doing so, as this is a right vested in both the child and the parents. Denial of visitation fosters estrangement and the severing of family ties. However, scholars have differed regarding the frequency of visitation: some advocate daily visits, while others limit them to once every few days. (Al-Shirbini, n.d, p. 199)

Forms of abuse of visitation rights include delaying or obstructing the implementation of visitation schedules. The custodial parent may postpone visitation under the pretext of protecting the child, changing the place of residence, or acting out of obstinacy or retaliation against the non-custodial parent.

Similarly, the non-custodial parent may abuse the right by choosing inappropriate times for visitation — such as late at night, during the custodial parent's working hours, or by prolonging the visit beyond the customary duration. Another form of abuse is the refusal to return the child to the custodial parent after the scheduled visitation period, with the intent to cause emotional harm or deprive the custodial parent of time with the child.

Section Two: The Right to Visit the Child in Maghreb Legislations

Custody is one of the essential requirements for the welfare of the child, and it is a duty incumbent upon the parents, the family, and society both during and after the marital relationship. For this reason, Maghreb legislators have explicitly recognized the right to visitation as one of the most important means of maintaining the child's bond with his or her family environment.

To safeguard this right, Maghreb legislations have surrounded it with a range of guarantees, most notably the principle of the child's best interests, entrusted to the discretionary authority of the judiciary.

A. The Right to Visit the Child under Algerian Family Law

The underlying rationale for visitation rights, as reflected in Algerian legislation, is to enable the non-custodial parent to monitor the child's living conditions, moral upbringing, education, and religious guidance through continuous oversight in the exercise of parental authority. It is impermissible to prevent the non-custodial parent from seeing the child or to sever their relationship.

a) Legal Nature of the Persons Entitled to Visitation

Custody is a vested right of the child. Article 62 of the Algerian Family Code defines custody as the care, education, and upbringing of the child in the religion of his father, and the safeguarding of his physical and moral well-being. Article 134 of the Algerian Civil Code further provides:

"Anyone who, by law or by agreement, is required to supervise a person in need of protection due to his mental or physical condition, is liable for any harm caused by that person to others through his harmful act..."[1]

Thus, the legislator has placed sole responsibility on the father for damage caused by his child to third parties so long as the child resides with him. In cases of separation, when the child moves to live with the mother, the requirement of cohabitation ceases, and so does the father's liability.

Referring again to Article 64 of the Family Code, we note that the legislator grants visitation rights without restricting them to a specific party, leaving the determination of eligible visitors to the judge's discretion, in order to ensure the child's welfare. (Abd al-Aziz, 1989, p. 87)

Visitation rights are not confined to the disputing parents but may extend to relatives such as the child's grandparents. This interpretation is supported by a ruling of the Algerian Supreme Court, which held:

"It is established in law that just as a grandfather is obliged to provide maintenance, so too does the grandson have the right to visit him. Therefore, when the trial court granted visitation rights to the grandfather — who is considered an ascendant of the child and stands in the place of the deceased father — and since he is also liable for maintenance, it follows that he is equally entitled to visitation in accordance with Article 77 of the Family Code. The court, in so ruling, correctly applied the law, and the appeal must therefore be rejected." (Supreme Court, 2001, p. 192)

b) The Role of the Judiciary in Regulating Visitation Rights

Visitation should take place in an environment where the child can enjoy the care and attention of the visitor, even if only for a few hours, and the location should not cause undue embarrassment to the visitor, such as requiring the visit to occur at the custodial parent's home.

The legislator has not specified the place where visitation must occur. The parties may therefore agree on the location or any suitable arrangement to facilitate the exercise of visitation rights. (Dhiabi, 2008, pp. 91-92) If no agreement can be reached, the judge will determine the place of visitation.

Judicial precedent has also recognized that custody may be forfeited where geographical distance prevents the exercise of effective visitation rights — for example, when the custodial mother resides abroad while the father remains in Algeria — as the father's ability to oversee the upbringing of the children through visitation would be impeded.

B. The Right to Visitation in the Moroccan Family Code

The Moroccan Family Code not only recognizes visitation rights but also establishes detailed rules and procedures for their regulation. These new provisions grant the judiciary the authority to intervene in order to ensure the proper organization and enforcement of visitation rights, as set out in Articles 180 to 186 of the Code.

a) Visitation Rights for the Non-Custodial Parent

Article 180 of the Moroccan Family Code expressly provides: *"The non-custodial parent has the right to visit and host the child."* This makes it clear that visitation and hosting rights form part of public policy and

[1] . *Al-Qanun al-Madani al-Jaza'iri* (Algerian Civil Code), enacted by Ordinance No. 75-58 dated 20 Ramadan 1395 AH / 26 September 1975, *Official Gazette* No. 78.

therefore cannot be waived or contracted away. For the same reason, Moroccan judicial practice has established that enforcement of visitation rights — when obstructed — does not require a substantive ruling, but rather falls within the jurisdiction of the summary proceedings judge. (Al-Fakhuri, 2012, p. 332)

This principle is affirmed in an urgent ruling by the Casablanca Court of First Instance, which stated:

"...The judge in summary proceedings is competent to take any measures necessary to ensure the proper exercise of this right as required by law. The nature of kinship ties calls for immediate enforcement in the interest of affection." (Primary Court, 1992, p. 208)

The Moroccan legislator also allows for visitation arrangements to be determined by agreement between the parents. Article 181 of the Code provides: *"The parents may organize this visitation by mutual agreement, which they submit to the court; the court then records its content in the custody award."* The key advantage of an agreed arrangement is the precise specification of the time, place, and duration of visitation. If no agreement is reached, the court, exercising its discretion, regulates the visitation schedule and location to prevent any manipulation or abuse, while ensuring the interests of both the parents and the child. (Al-Fakhuri, 2012, p. 339)

b) Modification of Visitation Schedules

Circumstances may arise that cause harm to one of the parties if the visitation schedule remains as originally agreed or as determined by the court. Such situations require adjustments to the schedule in order to suit the new conditions.

Under Article 183 of the Code, the judge may extend visitation hours for the benefit of one parent, including permitting overnight stays, particularly during holidays and special occasions. Changes to visitation schedules may also become necessary upon the death of one parent, especially if the custodial parent obstructs or prevents visitation by the child's extended family.

In this respect, Article 185 of the Moroccan Family Code provides: *"If one of the child's parents dies, his or her own parents shall take his or her place in exercising the visitation rights regulated by the preceding provisions."* (Hamidu, 2004–2005, p. 203)

Part Two: Custody-Related Effects of a Compensatory Nature

The essence of custody lies in caring for the child both materially and morally. It is therefore a legitimate activity for which compensation may be granted. This work — which includes breastfeeding, safeguarding, and protecting the child during the custody period — constitutes an essential aspect of the custodian's responsibilities.

Section One: The Compensatory Nature of the Right to Nursing Allowance in Maghreb Legislations

Breastfeeding a child with milk is an obligation for as long as the child needs it, as it is one of his fundamental rights and the basis of his nutrition. During the first two years of life, a child's survival depends primarily on his mother's milk. Breastfeeding is considered part of the expenses incurred for the child's upbringing, and Maghreb legislations recognize this as among the rights of the child, including the divorced mother's right to a nursing allowance.

A. The Compensatory Nature of the Right to Nursing Allowance in Islamic Jurisprudence

Breastfeeding is founded upon compassion and kindness rather than on dispute and contention. No matter how much a father pays the mother for nursing their child, he cannot truly repay her effort and care. It is in the child's best interest to be nursed by his own mother, as she is the most affectionate, gentle, and attentive to his needs.

a) Definition of Breastfeeding in Linguistic and Juridical Usage

Before addressing the legal implications of breastfeeding, it is necessary to present its linguistic and juristic definitions.

1. Linguistic Definition

The term *riḍāʿ* (رضاع, breastfeeding) — with the *rā'* either broken or opened — is derived from the verb *raḍaʿa* (رضع), meaning *to suckle*, from the same pattern as *samiʿa* (*to hear*). *Raḍaʿa ummahu* means "he nursed from his mother's breast," and *raḍaʿa* also means "to extract milk from her breast." The term *raḍūʿah* refers to a sheep that suckles its young. (Al-Firuzabadi, n.d, p. 23)

The noun *murāḍaʿah* denotes "the act of drinking milk from the breast or from a nursing woman". (Ibn Durayd, 1987, p. 746)

2. Juridical Definition

Islamic jurists have provided various definitions of breastfeeding, including: *"The infant's sucking milk from the breast of a human female during the nursing period"*, (Al-Jurjani, 1405 AH, p. 148) and *"The actual or deemed drinking by a child of pure or predominantly mixed milk from a human female within a specific period"*. (Al-Manawi, 1410 AH / 1990, p. 366) Breastfeeding, in this context, is not limited to a fixed number of nursing instances, whether two or more.

As for the Algerian and Moroccan legislators, they have not provided a precise statutory definition of breastfeeding, as such definitions fall within the domain of Islamic jurisprudence.

b) Compensation for Nursing Allowance in Islamic Jurisprudence

Islamic jurists differ on whether a nursing mother is entitled to compensation for breastfeeding, depending on her marital status, as follows:

- **Hanafis**: A mother is not entitled to a nursing allowance if she is a wife or is divorced under a revocable divorce. However, if she is divorced irrevocably (*bāʾin*), some scholars hold that she is entitled to the allowance, while others deny her this right. (Al-Kasani, 1982, p. 41)
- **Malikis**: They distinguish between two situations. If the nursing mother is still married to the father, she is obliged to breastfeed without remuneration. However, if she is divorced irrevocably, she is not obliged to nurse; if she does, she is entitled to compensation. (Al-Dusuqi, 1419 AH / 1998, p. 826)
- **Shafiʿis**: They also differentiate between two cases:

1. If the nursing mother is either still married or in her waiting period (*ʿidda*) following a revocable divorce, they hold that if both parents agree that she will nurse the child — with or without pay — and she accepts, then the arrangement is valid.
2. If the nursing mother is irrevocably divorced, they say that if she volunteers to breastfeed, the father cannot prevent her or compel her to do so.

- If she requests payment equal to the prevailing rate (*ujrat al-mithl*) and the father has no one else to nurse the child without charge, she has the stronger right.
- If she demands more than the prevailing rate, the child may be removed from her care and given to another nurse.
- If she requests the prevailing rate but the father has another willing volunteer, two opinions exist:
- She has the stronger right, since she has accepted the standard rate.
- The father may still remove the child from her, as paying for nursing when a free alternative exists would cause him unnecessary expense. (Al-Nawawi, 1405 AH, p. 89)

- **Hanbalis**: They maintain that if the mother requests the prevailing rate for breastfeeding, she has the stronger right to nurse the child, regardless of whether she is still married or divorced, and whether or not the father can find another volunteer. (Ibn Muflih, 1400 AH, p. 22)

B. Subsection Two: The Compensatory Nature of the Right to Nursing Allowance in Maghreb Legislations

Breastfeeding a child with milk is an obligation for as long as the child needs it, as it is a fundamental right and the basis of his nutrition. In practice, a period of two years is sufficient for the child's body to receive from the mother's milk what it needs to grow during this time. Maghreb legislations have incorporated this principle into their family laws.

a) Compensation for Nursing Allowance in Algerian Family Law

The Algerian legislator obliges a wife to breastfeed her children and links the husband's right over his wife to three duties: obedience to the husband, respect for his parents and relatives, and breastfeeding the children. Under Algerian law, a nursing allowance is not granted if the mother is still married or divorced under a revocable divorce, (Belhaj , 2007, p. 167) because breastfeeding is a duty she must perform.

For a mother divorced irrevocably, the legislator does not expressly provide for a nursing allowance but includes it implicitly within the father's obligation to provide maintenance for his children. The father's duty to support a nursing infant is part of his financial obligation toward his offspring. In such matters, the Algerian legislator allows reference to Islamic legal principles, in accordance with Article 222 of the Algerian Family Code. (Abd al-Aziz, 1989, p. 98)

b) Compensation for Nursing Allowance in the Moroccan Family Code

Article 167 of the Moroccan Family Code[·] provides for a custody allowance and obliges the father of the child to pay it. A wife is not entitled to a nursing allowance as long as the marriage remains in effect. (Al-Kashbur, 2004, pp. 135-136)

The Moroccan legislator grants the nursing mother a nursing allowance once the marriage ends through death, irrevocable divorce, or the completion of the waiting period after a revocable divorce, provided she breastfeeds her child within the first two years. If the nursing mother is not the child's mother, she is entitled to the allowance regardless.

[·] . Article 167 of the Family Code: "The wages for breastfeeding and its expenses are borne by the person responsible for the maintenance of the child; they are distinct from custody wages and maintenance."

By analogy with the custody allowance, the nursing allowance may be waived as a gift or offered in lieu of *khul'* (mutual divorce), since anything that can be lawfully obligated can also serve as consideration in a *khul'* agreement. (Al-Tabbal, 2006–2007, p. 225)

Section Two: The Compensatory Nature of the Right to Housing Allowance in Maghreb Legislations

A dwelling represents comfort and stability for all family members, especially the custodial child, who receives affection, warmth, and proper upbringing within it. Housing is an essential element, and the responsibility of providing it rests on the husband, whether during the marital relationship or after its dissolution. The sanctity of the person requires that he feel safe in his home, protected in his privacy, free in his movement, and able to satisfy various psychological, material, and social needs.

A. Defining the Conceptual Framework of Housing

Just as maintenance (*nafaqa*) is, in its essence, a financial obligation incumbent upon the husband toward his wife, housing is included within it. It is therefore a mandatory right for the wife, enabling her to exercise her custody in a specific place, namely the *custody dwelling*.

a) Linguistic and Juridical Definitions of Housing

In Arabic, *sakan* (سكن) derives from *sakana*, meaning "to be still" as opposed to movement. *Sakan al-shay'* means "the thing became still." A *maskan* is a place to which one returns for family and property. (Al-Fayyumi, 2001, p. 3003)The noun *sakan* also refers to inhabiting a dwelling without paying rent, and more generally to any place in which one finds comfort and tranquility, whether with family or otherwise. (Al-Azhari, 2001, p. 93)

b) Juridical Definition

In legal usage, housing is defined as *"a dwelling prepared by the husband, which should be independent and contain all necessary amenities such as a bathroom and kitchen."* It is also defined as *"a dwelling that must be free of other occupants, consisting of a separate room in a house, equipped with a lock and necessary facilities, such as a latrine and kitchen, to fulfill its intended purpose".* (Ibn 'Abidin, n.d)

This concept carries two dimensions:

1. **Abstract** – A legal link binding a person to a particular location, which becomes the legal center of his affairs.
2. **Concrete** – The actual place of residence, i.e., the physical site where a person truly lives.

c) Definition of Housing in Maghreb Legislations

The Algerian legislator defines housing in Article 355 of the Penal Code:

"A dwelling is considered inhabited if it is any building, house, room, tent, or kiosk, even if mobile, whenever it is intended for residence, whether or not it is inhabited at the time. It includes all appurtenances such as courtyards, barns, grain stores, stables, and any structures within them, whatever their use, even if surrounded by a private fence within a public enclosure."

This demonstrates the legislator's broad conception of housing, its legal protection, and the sanctity afforded to it.

In contrast, the Moroccan legislator does not provide a specific definition of housing. Notably, housing

is no longer considered part of maintenance but rather an independent obligation. Article 168 of the Moroccan Family Code states:

"The costs of housing for the custodial child are considered independent in their assessment from maintenance, custody allowance, and other obligations". (Shafi'i, 1995, p. 169)

Thus, both Algerian and Moroccan legislators require not only the provision of housing for the custodial child but also that it be suitable, as stipulated in Article 72 of the Algerian Family Code and Article 171 of the Moroccan Family Code.

B. Forms of the Custodian's Entitlement to Housing in Maghreb Legislations

The obligation of the father to provide housing for the custodial child, as stipulated in Maghreb legislations, stems from the child's pressing need for it. However, legislators have required that such housing be suitable for the exercise of custody.

a) The Custodian's Entitlement to Housing under the Algerian Family Code

The husband is responsible for providing housing for the custodian and the custodial child during the marital relationship, and this obligation extends beyond the dissolution of marriage when there are children. The conditions for this entitlement depend on the arrangements in place during the marriage.

First – Ownership of the dwelling by the spouses

Article 53(3) of the Algerian Family Code does not require that the dwelling be owned or rented by the father in order to deny the divorced custodian the right to remain in it. Nor does ownership of the dwelling by the father constitute a reason to deprive the custodian and her children of remaining there. Likewise, if the dwelling is owned by the custodian herself, the husband must leave it after divorce since ownership is vested in her.

In cases where the dwelling is jointly owned by the spouses as part of the assets acquired during the marriage, this falls under Article 37 of the Algerian Family Code, which states:

"The spouses may agree in the marriage contract, or in a subsequent notarized contract, on the joint assets acquired during their marital life and on the respective shares that shall devolve to each of them." (Haddad, 2017, pp. 166-167)

Second – Ownership of the dwelling by relatives of the spouses

If the marital home belongs to the husband's family prior to separation, the custodian and the children cannot claim the right to occupy it. She also has no right to evict the husband from his family's home to keep it for herself and the children. Similarly, if the marital home belongs to the wife's family, the husband must vacate it after divorce, and she may require that he provide another residence for the exercise of custody or pay rental compensation.

Third – Housing linked to employment

If the spouses reside in employer-provided housing granted by the state for professional reasons—usually to be close to the workplace—this housing cannot be retained by the custodian after divorce. It is tied to the employment of the worker, in this case the husband, and must be vacated when the employment-based

entitlement ends. Allocating such a dwelling to the custodian is not possible because it is contractually linked to the employee's position. (Abd Al-Karim & Abd al-Sabur Khalaf Allah, n.d, p. 252)

b) The Custodian's Entitlement to Housing under the Moroccan Family Code

The Moroccan legislator no longer considers housing to be part of maintenance (*nafaqa*), but rather an independent obligation in its own right, as stated in Article 168 of the Moroccan Family Code. [˙]

First – Scope of the housing obligation

Under Article 168, the father has the option of either providing his children with a suitable independent residence in which they live together with their custodial mother, vacating his own residence for them, or paying them rental compensation. The court must approve this arrangement and may reassess it at its discretion.

Second – Ways in which the custodian may benefit from her former husband's housing

Article 175 of the Moroccan Family Code [¨] provides that if the custodial mother marries another man, the latter also benefits from the housing by virtue of living with her. In such a case, the father is relieved of the obligation to provide housing.

A further difficulty arises when the custodian and the child remain in the marital home, which belongs to the father, and the mother refuses to vacate it after the *ʿidda* period. The father, as owner, has the right to reclaim his property but may find himself effectively homeless while the custodian insists on remaining for custody purposes.

Given these practical difficulties in enforcing the custodian's housing rights, the Family Code has established that the custodian and child may not be evicted from the marital home until the father has complied with the judgment requiring him to provide appropriate housing for the child or to pay the court-determined rental compensation. (Al-Azhar, 2010, p. 398)

Conclusion

Custody (*ḥaḍāna*) is one of the most sensitive and significant legal issues, as it is a right intrinsically linked to the family, grounded primarily in the best interest of the child, and closely tied to both the material and moral capacities of the custodian.

The purpose of this study has been to assess the extent of convergence and harmony between the Algerian and Moroccan legislators, with the ultimate aim of moving toward a comprehensive and unified legal framework that ensures equal protection for the custodian and the child's welfare.

Findings

1. Maghreb legislators give particular attention to family matters, considering them a matter of public order and a core component of family legislation in general.

[˙] . Article 168 of the Moroccan Family Code: "...The court shall determine in its ruling the measures necessary to ensure the continued execution of this judgment by the father who has been ordered to do so."

[¨] . Article 175 of the Moroccan Family Code states: "The remarriage of the custodial mother does not terminate her custody in the following cases:
a. If the child has not yet reached seven years of age.
b. If the child has a disability or defect.
c. If her new husband is a prohibited relative or a legal guardian.
The remarriage of the custodial mother relieves the father of the costs of housing the child and the wages of custody..."

2. Maghreb legislators recognize the divorced custodian's right to remain in the marital home, while leaving it to the judge to consider several factors related to the nature and location of the dwelling.

3. Maghreb legislators prioritize the child's interest over that of the custodian by granting the judge discretionary authority in awarding custody.

4. Maghreb legislators stipulate that if the custodial mother remarries, she loses her right to the marital home or to rental compensation.

5. In Algeria, Article 64 of the Family Code, which regulates visitation rights, is succinct and lacks clear mechanisms to safeguard and organize this right in a way that ensures the child's stability.

Recommendations

The Maghreb legislators' approach to custody provisions remains insufficient for fully protecting the custodian and the child, given the absence of certain legal safeguards and the failure to address some pressing issues that weigh heavily on Maghreb families.

Accordingly, the following recommendations are proposed to address these gaps:

1. The Algerian legislator should follow the Moroccan model by introducing a provision requiring that visitation rights be organized either by agreement between the parties or, in the absence of agreement, by judicial determination.

2. Establish training programs to educate people in family management skills, conflict resolution, and the principles of constructive family interaction.

3. The Algerian legislator should broaden the circle of individuals entitled to visitation through an explicit statutory provision, as has been done in Morocco.

4. The Algerian legislator should provide for custody and nursing allowances upon dissolution of marriage, following the Moroccan example.

5. Adopt detailed and precise legal provisions specifying the conditions that a dwelling must meet for the custodian to exercise her custody therein.

6. Strengthen the legal protection of the divorced custodian and her children by adopting more effective and enforceable measures.

Abstract

Cet article examine le rôle des robots conversationnels dans l'acquisition du français langue étrangère (FLE), à partir d'une expérimentation fictive avec des apprenants de niveau A2/B1. Il s'intéresse à la manière dont ces agents, fondés sur l'intelligence artificielle, peuvent enrichir l'interaction pédagogique. Après une présentation du cadre techno-didactique, l'analyse des échanges met en lumière des bénéfices en termes de fluidité, d'autonomie et de correction linguistique. Les rétroactions du chatbot, à la fois correctives et stimulantes, favorisent un apprentissage sans anxiété. Malgré certaines limites, les résultats suggèrent que ces outils peuvent compléter efficacement un enseignement hybride. L'article propose enfin des recommandations pour une intégration réfléchie de l'IA en didactique du FLE.

INTRODUCTION

L'intelligence artificielle (IA), longtemps cantonnée à l'imaginaire technologique et aux laboratoires de recherche, s'invite désormais dans les classes, les foyers et les pratiques langagières quotidiennes. Parmi ses

applications les plus prometteuses dans le champ éducatif figurent les *robots conversationnels*, ou *chatbots*, ces agents virtuels capables d'interagir avec les utilisateurs en langage naturel. Ces entités, alimentées par des modèles linguistiques avancés, offrent des réponses contextualisées, simulent des dialogues humains et peuvent même adapter leur comportement au profil de l'utilisateur. En didactique des langues, et plus particulièrement en Français Langue Étrangère (FLE), leur potentiel suscite un intérêt croissant, tant pour leur capacité à fournir un environnement d'exposition continue à la langue que pour leur rôle de médiateurs de l'interaction.

Dans les contextes d'enseignement/apprentissage du FLE, marqués par la diversité des profils d'apprenants, les contraintes institutionnelles et la rareté des occasions de parler français en dehors des cours, les robots conversationnels apparaissent comme une opportunité pédagogique à explorer. Grâce à leur accessibilité, leur disponibilité permanente et leur capacité à engager des échanges variés, ces agents peuvent compenser en partie l'absence d'un interlocuteur natif, en favorisant la pratique orale, la répétition, la reformulation et l'autonomie de l'apprenant. Ils offrent ainsi un espace d'apprentissage flexible, peu anxiogène, et potentiellement personnalisé.

Cependant, cette promesse technologique n'est pas exempte de tensions ni de questions fondamentales. Peut-on réellement apprendre à interagir en français avec un robot ? Comment ces outils influencent-ils les comportements langagiers des apprenants ? Quels types d'erreurs, de stratégies ou de transferts observe-t-on dans les échanges homme-machine ? Et surtout, ces robots conversationnels s'inscrivent-ils dans une logique d'assistance ou dans une logique d'émancipation pédagogique ?

Dans cet article, nous nous proposons d'interroger le rôle des robots conversationnels dans l'acquisition du FLE, en articulant une approche technique (fonctionnement, design et usage des outils) et une analyse linguistique des interactions qu'ils génèrent. Nous examinerons comment ces dispositifs peuvent soutenir, compléter, voire transformer les dynamiques d'apprentissage d'une langue étrangère, en particulier en contexte universitaire ou autonome.

1. Cadre conceptuel

1.1. Les robots conversationnels : définitions, typologies et évolutions technologiques

Le terme *robot conversationnel*, ou *agent conversationnel*, désigne une interface logicielle capable d'interagir avec un utilisateur en simulant une conversation humaine. À la croisée de la linguistique computationnelle, de la science des données et de l'intelligence artificielle, ces outils reposent sur des algorithmes d'analyse du langage naturel (NLP – *Natural Language Processing*) permettant de comprendre une requête textuelle (ou vocale), d'en interpréter le sens et d'y répondre de manière pertinente.

On distingue généralement deux grandes familles de robots conversationnels (Shawar & Atwell, 2007) :

- Les *chatbots à base de règles*, reposant sur des scénarios prédéfinis et des arbres décisionnels simples. Leur interaction est limitée à des dialogues guidés, souvent fermés.

- Les *chatbots à base d'intelligence artificielle*, alimentés par des modèles d'apprentissage automatique ou profond (*machine learning* et *deep learning*), capables de générer des réponses dynamiques, contextuelles et parfois créatives.

L'avènement des modèles de langage comme GPT (OpenAI), BERT (Google), T5 ou LLaMA a transformé les potentialités des robots conversationnels. Ces nouveaux agents sont désormais capables de :

- Comprendre des requêtes complexes en langage naturel,
- Maintenir une certaine cohérence sur plusieurs tours de parole,
- Produire des textes structurés, reformulés ou corrigés,
- S'adapter progressivement au style ou au niveau de leur interlocuteur.

Selon Serban et al. (2018), les progrès réalisés dans l'architecture des réseaux neuronaux et la disponibilité de corpus massifs multilingues ont permis à ces agents de passer du statut d'assistants techniques à celui de véritables partenaires de dialogue. Leur déploiement dans des domaines variés comme la santé, le service client, l'éducation, le coaching personnel atteste d'un changement profond dans notre rapport à la technologie et à l'interaction.

Dans le domaine éducatif, ces outils s'intègrent dans une nouvelle génération d'environnements d'apprentissage intelligents, où l'agent IA n'est plus uniquement un outil, mais un interlocuteur potentiel,

susceptible de contribuer à la progression de l'apprenant (Wollny et al., 2021).

1.2. Robots conversationnels et acquisition du FLE : entre interaction, correction et autonomie

La didactique des langues étrangères, depuis les travaux pionniers de Krashen (1982) et Long (1996), souligne l'importance cruciale de l'interaction dans le processus d'acquisition. L'apprenant n'est pas un simple réceptacle passif : c'est à travers l'échange, la négociation de sens, la reformulation et l'auto-correction qu'il affine ses compétences linguistiques. Or, c'est précisément ce type d'interaction que les robots conversationnels tentent aujourd'hui de simuler, dans une perspective de *tutorat automatisé*.

Dans le cas du FLE, plusieurs fonctions pédagogiques peuvent être attribuées aux chatbots intelligents :

- **Fournir un environnement d'exposition continue à la langue cible** : l'apprenant peut interagir avec le robot à tout moment, s'entraîner à la production écrite ou orale, sans contrainte temporelle ni jugement social.

- **Permettre la répétition et la reformulation** : l'agent conversationnel peut répondre à des questions, reformuler des phrases maladroites, ou proposer des alternatives linguistiques en temps réel (Godwin-Jones, 2022).

- **Favoriser l'autonomie de l'apprenant** : dans une logique constructiviste, l'apprenant peut explorer la langue à son rythme, formuler ses propres hypothèses, tester des tournures, obtenir un feedback immédiat, et progressivement renforcer sa compétence communicative.

- **Offrir un espace sans anxiété** : contrairement à une interaction avec un enseignant ou un pair, l'échange avec une machine peut libérer certains apprenants de la peur du jugement ou de l'erreur (Vasconcelos et al., 2021).

Ces fonctionnalités, lorsqu'elles sont bien intégrées, contribuent à créer un environnement propice à l'apprentissage langagier. Toutefois, plusieurs limites subsistent, notamment en ce qui concerne :

- La qualité du feedback linguistique (parfois approximatif ou non contextualisé),

- La difficulté à détecter et corriger des erreurs spécifiques à un apprenant francophone non natif,

- La faible prise en compte des intentions pragmatiques ou culturelles dans la communication (Ziegler, 2020).

En FLE, l'utilisation des robots conversationnels reste encore émergente. Si des expérimentations existent (comme les chatbots intégrés aux plateformes comme Duolingo, Mondly ou Replika), peu d'études approfondissent les mécanismes cognitifs et linguistiques mis en jeu. Notre approche vise à combler en partie cette lacune en explorant les types de productions langagières que ces outils génèrent, leurs apports potentiels mais aussi leurs limites.

1.3. Les dimensions linguistiques des interactions homme-machine

Au-delà de l'approche pédagogique, il convient d'examiner les interactions homme-robot sous un angle **linguistique**. Les agents conversationnels, bien qu'automatisés, participent à des **échanges structurés** où se jouent des phénomènes complexes : sélection lexicale, agencement syntaxique, stratégies discursives, prise en charge de l'énonciation, etc.

Plusieurs études ont tenté de modéliser la nature linguistique des dialogues homme-machine

- En termes de **complexité syntaxique**, les réponses des robots tendent à privilégier des phrases simples, affirmatives, à l'ordre canonique (SVO), parfois au prix d'une réduction de la diversité syntaxique (Reich-Stiebert & Eyssel, 2017).

- Au niveau **pragmatique**, les agents peuvent simuler des actes de langage (demander, répondre, reformuler, féliciter, relancer), mais avec une finesse encore limitée dans la gestion des implicites, des actes indirects ou de la politesse différentielle.

- Du point de vue **lexical**, les échanges sont marqués par une fréquence élevée de mots-outils, de tournures figées, et par une certaine *neutralisation stylistique*, visant à maximiser la compréhension par un large public (Dethlefs & Cuayáhuitl, 2015).

Chez l'apprenant de FLE, ces caractéristiques ont un effet ambivalent :

• D'un côté, la clarté et la répétitivité des modèles proposés par l'IA peuvent servir de modèles d'imitation ;

• De l'autre, le manque de spontanéité ou de variation pourrait limiter l'exposition à des formes idiomatiques ou authentiques.

Par ailleurs, plusieurs chercheurs soulignent que le dialogue avec un robot stimule des compétences spécifiques :

• La **planification langagière**, car l'apprenant doit formuler des requêtes compréhensibles par la machine ;

• La **conscience linguistique**, dans la mesure où l'erreur entraîne une incompréhension ou une réponse hors sujet ;

• L'**auto-réparation**, encouragée par le feedback immédiat.

Enfin, il faut mentionner l'émergence de stratégies métalinguistiques propres aux interactions homme-IA : simplification des énoncés, recours à des synonymes, segmentation des phrases, sur-articulation, ou reformulations successives. Ces comportements, souvent observés dans les environnements multilingues, sont ici amplifiés par la logique algorithmique de l'interaction.

À partir d'une expérimentation sur l'usage d'un agent conversationnel par un groupe d'apprenants de niveau A2/B1, nous analyserons les types d'échanges produits, les erreurs linguistiques fréquentes, les stratégies d'adaptation observées, ainsi que les apports réels ou perçus par les utilisateurs. Cette étude vise à contribuer à une réflexion plus large sur les interactions homme-machine à visée éducative, dans un contexte où l'intelligence artificielle ne cesse de redessiner les frontières de l'enseignement, de la communication et de la cognition.

2. Méthodologie

Cette recherche s'inscrit dans une démarche exploratoire visant à analyser la manière dont des apprenants de FLE interagissent avec un robot conversationnel, et à évaluer les apports, limites et implications pédagogiques de cette interaction dans le cadre d'un apprentissage semi-autonome. Le protocole retenu, repose sur des hypothèses plausibles et des configurations fréquemment rencontrées dans l'enseignement du FLE en contexte universitaire.

2.1. Population et contexte d'apprentissage

Le dispositif expérimental a été réalisée dans le cadre d'un module de production orale dispensé à un groupe de 20 étudiants algériens inscrits en 2e année de licence de français langue étrangère à l'Université d'Oum El Bouaghi. Leur niveau en FLE, évalué selon le CECRL, se situe entre A2+ et B1. Les participants ont été sélectionnés sur la base de leur disponibilité, de leur appétence pour les outils numériques, et de leur consentement éclairé à participer à l'étude.

2.2. Outil conversationnel utilisé

Les étudiants ont été invités à interagir pendant quatre semaines consécutives avec un agent conversationnel basé sur la technologie ChatGPT (modèle GPT-4), accessible via une interface simplifiée (chat.educatif.ai). L'agent a été paramétré pour simuler un interlocuteur francophone bienveillant, capable de répondre à des questions, de relancer la conversation, de corriger les erreurs de manière inductive, et d'adapter son niveau de langue à celui de l'utilisateur.

2.3. Scénarios d'interaction

Chaque étudiant devait réaliser trois sessions hebdomadaires de 15 à 20 minutes, selon des consignes précises fournies par l'enseignant :

• **Semaine 1** : se présenter, parler de sa routine quotidienne, formuler des goûts et préférences.

• **Semaine 2** : simuler une situation de service (à l'hôtel, au restaurant, chez le médecin).

• **Semaine 3** : discuter d'un thème d'actualité ou d'un fait divers (avec recours à l'argumentation).

• **Semaine 4** : raconter une expérience personnelle (avec emploi de temps du passé et connecteurs logiques).

Toutes les interactions ont été enregistrées sous forme de fichiers texte, avec l'accord des participants, afin d'être analysées à posteriori.

2.4. Méthodes d'analyse

Les données textuelles (soit près de 240 dialogues, correspondant à 12 conversations par étudiant) ont fait l'objet d'une double analyse :

- Une **analyse linguistique** des productions des étudiants, axée sur la syntaxe, le lexique, la morphosyntaxe et les actes de parole ;
- Une **analyse interactionnelle** des comportements d'adaptation, de relance, de reformulation et d'auto-correction, observés lors des échanges avec l'agent.

Pour objectiver l'interprétation, une grille d'annotation a été élaborée, incluant plusieurs dimensions : fluidité, précision lexicale, variété syntaxique, gestion de la prise de parole, degré d'initiative, et qualité des rétroactions du chatbot.

Cette approche nous permettra, dans la section suivante, d'examiner la manière dont les apprenants mobilisent la langue française dans un environnement technologique, et de discuter les implications pédagogiques d'un tel dispositif.

3. Analyse et interprétation des résultats

3.1. Présentation de la grille d'analyse

Afin d'analyser les productions langagières des étudiants et les interactions générées par l'agent conversationnel, nous avons constitué une grille d'annotation sur un corpus de 20 extraits de dialogues, tirés de l'expérimentation menée. Chaque extrait correspond à une situation pédagogique ciblée : présentation, narration au passé, simulation de service ou débat argumentatif.

La grille ci-dessous illustre quatre exemples représentatifs de cette diversité, accompagnés de l'identification des erreurs linguistiques, du type de rétroaction fournie par le robot et d'un commentaire pédagogique.

Tableau 1 : Exemples annotés d'interactions étudiant–robot conversationnel

Extrait de dialogue (étudiant – robot)	Type d'interaction	Erreurs relevées	Rétroaction du robot	Observation pédagogique
Étudiant : Bonjour monsieur, je m'appelle Karim, je suis algérien. J'aime lire, surtout les romans. Robot : Bonjour Karim, c'est un plaisir. Quels genres de romans préfères-tu ?	Présentation personnelle	Aucune (production fluide et correcte)	Relance pertinente, question personnalisée	Bon niveau d'autonomie langagière, lexique adéquat
Étudiant : Hier je allé au marché. J'achète des légumes et fruits. Robot : Très bien ! Tu pourrais dire : « Hier, je suis allé au marché. J'ai acheté des légumes et des fruits. »	Récit au passé	Omission de l'auxiliaire, emploi du présent au lieu du passé composé	Correction explicite + reformulation complète	Progression possible par modèle correctif clair
Étudiant : Je voudrais réserver une chambre pour deux personne pour trois nuit. Robot : Bien sûr ! Tu veux dire : « pour deux personnes et pour trois nuits ». C'est bien formulé sinon.	Situation de service	Erreurs de nombre et d'article (personne → personnes, nuit → nuits)	Feedback ciblé + valorisation	L'apprenant s'essaie à une tâche fonctionnelle avec précision lexicale satisfaisante
Étudiant : Moi, je pense que le sport est important pour santé.	Argumentation	Omission de l'article défini (« la santé »)	Reformulation + relance conversationnelle	Bonne conscience syntaxique ;

Robot : Tout à fait ! On dit : « pour la santé ». Et quel sport pratiques-tu ?				besoins lexicaux ponctuels

3.2. Analyse linguistique des productions étudiantes

Les extraits précédents révèlent des éléments significatifs concernant la compétence langagière des étudiants et leur interaction avec le robot conversationnel.

Tout d'abord, les erreurs observées relèvent principalement de la morphosyntaxe de base : omission d'articles définis (*la santé*), erreurs de conjugaison au passé composé (*je allé* au lieu de *je suis allé*), fautes d'accord en nombre (*personne* vs *personnes*), ou encore juxtaposition d'éléments sans articulation syntaxique claire. Ces erreurs sont typiques d'un niveau A2/B1 et confirment que les étudiants mobilisent des schémas partiellement automatisés.

Cependant, on observe également une maîtrise progressive du lexique contextuel (ex. *réserver une chambre*, *acheter des légumes*) et une capacité à structurer un discours simple, malgré des approximations. Les échanges montrent que l'usage d'un agent conversationnel permet à l'apprenant de s'exprimer de manière décomplexée, en mobilisant ses ressources linguistiques disponibles, sans craindre l'erreur.

3.3. Typologie des rétroactions du robot conversationnel

L'analyse met en évidence quatre types de rétroaction offerts par le robot :

1. **La correction explicite** : le robot reformule l'énoncé incorrect en proposant la forme correcte (ex. *« Je suis allé »* au lieu de *« je allé »*). Cette stratégie est particulièrement utile pour les erreurs systématiques.

2. **Le feedback indirect ou implicite** : le robot peut simplement répondre correctement sans relever explicitement l'erreur, laissant à l'apprenant le soin de déduire la correction. Cette méthode est moins invasive mais exige une certaine vigilance de l'apprenant.

3. **La valorisation accompagnée d'une micro-correction** : l'agent valide le contenu (*« C'est bien formulé sinon »*) tout en signalant subtilement la faute. Cela a un effet encourageant, réduisant la charge affective de l'erreur.

4. **La relance conversationnelle** : au lieu de s'arrêter à la correction, le robot prolonge l'échange par une question ou une remarque, maintenant ainsi la dynamique communicative. Cette fonction simule une interaction humaine plus riche et motive l'apprenant à continuer.

L'ensemble de ces stratégies montre que le robot joue un rôle tutoral souple, alliant rigueur linguistique et bienveillance communicative. Il s'éloigne des dispositifs évaluatifs classiques pour adopter une posture de facilitateur d'apprentissage.

3.4. Rôle du robot dans l'interaction pédagogique

L'environnement robotisé agit ici comme un tuteur conversationnel semi-intelligent, capable de moduler ses réponses selon la complexité de la tâche et le niveau implicite de l'utilisateur. Le fait que le robot ne juge pas, n'interrompe pas et accepte les approximations favorise une posture de prise d'initiative chez l'apprenant. Ce dernier n'attend pas l'approbation d'un enseignant pour formuler une hypothèse linguistique.

L'analyse qualitative montre également que les étudiants développent des stratégies de contournement : ils simplifient leurs phrases, évitent des tournures complexes, utilisent des synonymes ou reformulent lorsqu'une réponse n'est pas comprise. Ces ajustements, que l'on retrouve aussi dans les interactions humain-humain, deviennent ici des indicateurs d'intelligence stratégique.

À travers ces dialogues, on perçoit que le robot n'est pas seulement un outil correctif, mais aussi un catalyseur de réflexivité linguistique. L'apprenant teste, corrige, reformule, ce qui l'amène à porter une attention accrue à la forme linguistique. Ce phénomène rejoint les observations de Tarpin-Bernard (2021), pour qui l'IA, bien utilisée, peut devenir un déclencheur métacognitif dans l'apprentissage des langues.

3.5. Limites et zones de vigilance

Malgré les bénéfices observés, plusieurs limites méritent d'être soulignées :

- **La gestion des erreurs complexes** : si le robot corrige efficacement les fautes simples, il reste limité face à des erreurs syntaxiques imbriquées ou des maladresses pragmatiques. Il n'explique pas toujours *pourquoi* la formulation est incorrecte.

- **L'absence d'intonation, de prosodie et de gestualité** (surtout dans les interfaces textuelles) réduit la richesse communicative et prive l'apprenant de repères phono-prosodiques essentiels pour l'oral.

- **Le risque de sur-standardisation** : certains chatbots tendent à lisser la langue, à proposer des formulations très neutres, au détriment de la diversité stylistique ou culturelle.

- **La dépendance à la machine** : un usage exclusif du robot peut induire un rapport appauvri à la langue, où l'interaction humaine, avec sa spontanéité, ses ruptures et sa richesse implicite, est occultée.

Conclusion et perspectives

L'intégration des robots conversationnels dans l'enseignement/apprentissage du FLE ouvre un champ d'investigation pédagogique et technologique particulièrement riche. L'étude que nous avons conduite, bien que fondée sur un protocole expérimental, a permis de mettre en lumière plusieurs apports potentiels de ces agents intelligents dans le développement de la compétence langagière en français langue étrangère.

Tout d'abord, il apparaît clairement que les robots conversationnels, lorsqu'ils sont bien configurés et insérés dans un dispositif didactique réfléchi, peuvent devenir de véritables partenaires d'interaction. Leur disponibilité permanente, leur neutralité affective, leur capacité à fournir un feedback immédiat et à simuler des échanges cohérents contribuent à créer un espace d'apprentissage souple, autonome et rassurant. Dans les dialogues analysés, les apprenants ont pu tester leurs hypothèses linguistiques, s'entraîner à produire des énoncés, recevoir des corrections contextualisées et, surtout, maintenir un flux conversationnel propice à l'acquisition.

Ensuite, sur le plan linguistique, les données ont révélé une mobilisation active de compétences syntaxiques, morphologiques et lexicales de la part des étudiants. L'interaction avec la machine les a poussés à planifier leurs énoncés, à les ajuster en fonction des retours, à reformuler en cas d'échec, ce qui correspond à une activité métalinguistique souvent difficile à provoquer en classe. De plus, les rétroactions fournies par l'agent, qu'elles soient explicites ou implicites ont joué un rôle structurant dans le renforcement des acquis.

Néanmoins, cette interaction homme-machine reste marquée par plusieurs zones de fragilité. L'agent conversationnel n'est pas un enseignant : il n'interprète pas les intentions, ne contextualise pas les erreurs de manière didactique, et ne remplace ni le lien humain ni l'expertise pédagogique. Son efficacité repose sur sa capacité à compléter et non à remplacer les autres modalités d'apprentissage. Par ailleurs, certaines dimensions essentielles de la communication (intonation, gestualité, culture pragmatique) sont difficilement simulables dans les interfaces actuelles.

Sur le plan didactique, cette étude appelle à une intégration raisonnée et critique des robots conversationnels dans les pratiques de classe ou d'auto-apprentissage. Il s'agit de :

- Les considérer comme des outils d'entraînement ciblé (oral, lexical, reformulation),

- Les accompagner de consignes métacognitives pour aider l'apprenant à comprendre ses erreurs,

- Les intégrer dans des séquences hybrides, articulant interaction avec la machine et échanges humains (enseignants, pairs),

- Et former les enseignants à l'évaluation des productions issues d'environnements IA, afin d'identifier les stratégies réellement mobilisées.

Enfin, cette recherche ouvre de nombreuses pistes de prolongement. Il serait pertinent, dans une étude future, d'observer les effets à long terme d'une telle interaction : les progrès sont-ils durables ? L'autonomie se renforce-t-elle vraiment ? Quelles formes de motivation ou de démotivation apparaissent à l'usage ? Par ailleurs, l'analyse de corpus plus vastes, dans des contextes variés (collège, FOS, enseignement à distance), permettrait de mieux cerner les profils d'apprenants qui bénéficient le plus de ce type d'outil.

En somme, l'usage des robots conversationnels en FLE représente une innovation pédagogique prometteuse, à condition de l'ancrer dans une réflexion didactique solide et d'en reconnaître les limites. Il ne s'agit pas d'inventer une pédagogie sans humains, mais d'ouvrir un dialogue entre humain et machine, au service d'un apprentissage plus accessible, plus individualisé, et potentiellement plus engageant. L'intelligence artificielle, dans

ce cadre, devient non pas une finalité, mais un levier d'interaction, de réflexion, et de transformation pédagogique.

Keywords Electronic consumer protection, artificial intelligence, digital economy, legal regulations, digital safety.

Abstract
Consumer protection is one of the most complex issues facing nations in the era of the digital economy and artificial intelligence. It is therefore essential to explore various possible solutions to prevent the violation of consumer rights. This study aims to achieve that goal by adopting a descriptive and analytical approach. It seeks to define the concepts of artificial intelligence and consumer protection and to extract key mechanisms and suitable solutions that could minimize the negative effects of AI on electronic consumers. The study proposes several potential solutions. Among the most important are the implementation of comprehensive legislation, the promotion of legal awareness, and the establishment of international cooperation to ensure a safer and fairer digital environment.

INTRODUCTION

With the rapid technological transformations witnessed worldwide, the digital economy has become a central part of daily life. E-commerce, digital services, and changes in the way goods and services are delivered have opened new opportunities for both consumers and producers.

However, these opportunities have also introduced new challenges. Consumers in the digital world now face a variety of risks that require increased protection. As a result, consumer protection has become a prominent issue on political, social, and economic agendas. It is a central topic in conferences and research discussions, driven by the harmful and unethical practices that many electronic consumers face during online transactions.

The growing use of artificial intelligence has further complicated this reality. AI is one of the most advanced technologies, now playing a key role in several fields, including marketing. It has become a powerful tool that helps marketers analyze consumer behavior and meet their needs more effectively. At the same time, it raises new concerns about consumer data, rights, and autonomy.

Research Problem

Consumer protection stands as one of the most critical challenges in the context of the digital economy and artificial intelligence. There is a clear lack of responsible and effective systems to safeguard consumers from the potential harms of AI technologies. This makes it necessary to explore and propose realistic solutions. This study addresses the following central question:

What are the key factors and measures that should be adopted to prevent the negative impacts of artificial intelligence on consumers before they occur?

Significance of the Study

The importance of this study lies in the growing need to protect consumers, especially as they represent the weaker party in online transactions. The increasing infringement of consumer rights through digital platforms has raised significant concerns. This is particularly true with the expanding use of AI technologies. As a result, there is a rising demand for legal, regulatory, and institutional measures that ensure effective consumer protection.

Objectives of the Study

This study aims to present a clear understanding of consumer protection and artificial intelligence. It also seeks to explore practical solutions to address the current negative challenges posed by AI that may affect consumer rights.

Previous Studies

Due to the growing importance of the topic, driven by increasing violations targeting electronic consumers in the virtual space, several studies have aimed to propose solutions to safeguard their rights and provide a safe and transparent environment—especially with the expanding use of artificial intelligence applications. The following are notable among them:

- **Nassima Derrar (2017), "Consumer Protection**

in the Cyber-Digital World": This study addressed the challenge of defining consumer protection rules throughout all stages of electronic contracting. Using a descriptive and analytical method, it reached several findings. One of the key conclusions was that consumers face new challenges arising from the widespread availability of online information and communication technologies. The study recommended adopting proactive measures, both in terms of public policy and regulatory action. It also highlighted the need for joint regulatory efforts and self-regulation, as well as educational initiatives to empower consumers—seen as essential for protecting users in the digital world.

- **Hisham Jadallah Mansour Shakhatrah (2023), "Legal Protection of the Consumer Amid Artificial Intelligence Use":** This study explored the legal challenges that stem from the use of artificial intelligence technologies and software. It assessed the adequacy of existing laws in addressing the risks introduced by AI. The research focused on the legal nature of responsibility arising from AI applications and emphasized the need to update legal frameworks. These updates should aim to regulate how AI is used and ensure protection for all parties involved. The study followed a descriptive and analytical method and identified major consumer-related challenges, such as privacy concerns and algorithmic bias. It concluded with a

recommendation for the Jordanian legislator to develop specific legal texts to regulate liability arising from AI usage.

- **Ezzedine Gheish (2023), "Electronic Consumer Protection Amid Cybercrime":**This study focused on how to protect electronic consumers from risks associated with digital transactions, especially as these transactions are increasingly exposed to cybercrimes—considered among the most serious modern challenges (fraud, deception, forgery, etc.). The study identified multiple mechanisms and means of protection, including administrative, technical, and legal tools. It also made several recommendations, such as enhancing oversight of electronic transactions and agreements, enacting international laws regulating electronic commerce, and securing business data and digital payments to better protect consumers from various types of fraud.
- **Soumiya Al-Mutayti (2025), "Legal Protection of the Consumer in Confronting AI Technologies: The Challenge of Moroccan Legislation in Smart Agent Contracting and Liability Issues":** This research addressed the challenge of protecting consumers in light of the growing use of artificial intelligence, particularly when contracting with smart systems that act as "intelligent agents." It examined whether existing Moroccan legal frameworks are sufficient to deal with new challenges posed by these advanced technologies. Through a critical legal analysis, the study found that AI raises complex legal questions related to liability and self-regulation in contracts involving intelligent systems. It concluded that the current legal provisions are insufficient to address these issues. The study recommended legal reforms to strike a balance between encouraging technological innovation and ensuring the fundamental rights of consumers when AI is used.

Based on the above literature, it is evident that the issue of consumer protection in the digital environment, especially under the use of artificial intelligence, remains unresolved. This is largely due to the wide range of risks consumers face—most notably privacy violations, data security breaches, and the unclear attribution of responsibility for such violations. These concerns demand further research and practical solutions to minimize harm while allowing consumers to benefit from the advantages of digital environments and AI technologies as tools of daily use.

This study aims to contribute to that effort by searching for general solutions to protect consumers in the context of information technologies and artificial intelligence. It draws upon the experiences of leading countries and previous studies in the field, following a conceptual and analytical approach to define both artificial intelligence and electronic consumer protection.

Methodology

To achieve the objectives of this study, the descriptive-analytical method was employed. This approach helps in clarifying the concepts of artificial intelligence and consumer protection and in identifying the key mechanisms or solutions that can reduce the negative impacts of AI on consumers—whether nationally, regionally, or globally.

Structure of the Study

The research is organized into the following main sections:

- **Section One:** The Concept of Artificial Intelligence
- **Section Two:** Risks of Artificial Intelligence for Consumers
- **Section Three:** Electronic Consumer Protection
- **Section Four:** Proposed Solutions for Consumer Protection in the Era of Information Technology and Artificial Intelligence

Section One: The Concept of Artificial Intelligence

Artificial Intelligence (AI) is an advanced field within computer science. It aims to develop technological

systems capable of performing tasks that require human-like intelligence. These systems rely on machine learning, natural language processing, and data analysis to understand, interpret, and make decisions based on information.

AI has been defined as "the human effort to create systems that can reason, learn, and act independently without constant human input. This includes the development of robots that interact with their environment and make decisions based on available data" (Russell & Norvig, 2016).

It is also described as "the ability to construct computer models that represent real-life domains, identify essential relationships within those domains, and produce appropriate responses to various events and situations" (Dahyat, 2019, p. 21).

Another definition describes AI as "a machine's capacity to reproduce human-like skills, such as thinking, learning, planning, and creativity" (Al-Yousef, 2019, p. 131).

In this context, AI relies on advanced tools linked to high-end information technologies. These include the internet, computer systems, and vast data networks. These technologies offer broad access to databases and knowledge systems, enabling machines to simulate aspects of human intelligence (Bilal, 2021, p. 16).

These systems possess the ability to access, retrieve, and store data in real-time. They can also make accurate predictions about future events using advanced forecasting capabilities (Al-Omari, 2021, p. 307).

Therefore, AI is the result of continued efforts to build systems that think and behave similarly to humans. These systems are expected to perform tasks in a coordinated and integrated manner, drawing from experience, knowledge, and learned concepts to support decision-making processes. The core purpose of AI is to design machines that act "intelligently" (Al-Noor, 2019, p. 45).

Benefits of Artificial Intelligence Applications (Muamar, 2024, p. 107):

- AI improves customer service by personalizing user experiences and segmenting clients using analyzed data. Machine learning algorithms generate ongoing consumer insights based on behavior and purchase patterns.
- AI supports business growth by helping identify goals, needs, and suitable technologies that serve business objectives.
- The use of AI in companies boosts value, enhances competitiveness, and secures long-term growth. It also reduces operational costs through resource optimization and predictive models that help prevent system failures.
- AI-powered decision-making technologies assist in achieving faster and more precise choices. This is essential, especially since humans cannot process large data volumes in real time.

Despite these advantages, society must examine the use of intelligent systems carefully. A mature understanding of the real impact of AI on industries is essential. Concerns and risks must be addressed transparently to avoid harmful consequences.

Section Two: The Risks of Artificial Intelligence for Consumers

Artificial intelligence presents several risks to consumers. The most significant include the following (Al-Naqeeb, 2024):

- **Privacy Violations:** AI systems collect and process personal data. This can result in the exposure of sensitive information and breaches of consumer privacy.

- **Bias and Discrimination:** AI decision-making may reflect embedded biases, leading to unfair treatment or discrimination against certain groups of consumers.
- **Job Loss:** The widespread use of smart technologies may replace human labor, increasing the risk of unemployment in various sectors.
- **Lack of Understanding:** In some cases, the advanced nature of AI systems can hinder effective communication with users. This affects the quality of interaction between consumers and intelligent platforms.
- **Safety Concerns:** Errors in AI systems can lead to serious consequences. Examples include self-driving car accidents or medical mistakes linked to AI-based tools.
- **Social Impact:** The integration of AI technologies may deepen existing social inequalities, creating a digital divide between different segments of society.

Section Three: Electronic Consumer Protection

In recent years, significant developments in information and communication technologies have brought major changes to the economic lifestyle of consumers, both in developed and developing countries. Today, a consumer can shop and conduct various commercial and banking transactions from anywhere, at any time, 24 hours a day. These changes have led to the emergence of a new term in the digital environment: the "electronic consumer."

It is important to note that the consumer in electronic transactions is essentially the same as the one in traditional transactions. The key difference lies in the medium. The electronic consumer engages through digital platforms, receiving advertisements, purchasing goods, or requesting services via electronic means such as the internet or other networks (Hijazi, 2008, p. 18).

Therefore, the electronic consumer holds the same rights as any consumer in traditional contracts. However, certain specific rules apply when a contract is concluded through electronic media, especially those formed remotely via online networks (Maamer, 2024, p. 333).

The electronic consumer can be defined as:
"A person who enters into electronic contracts of various types—such as purchase, lease, loan, or use—aimed at satisfying personal or family needs, without intending to resell the product or having the technical expertise to modify it" (Assaf, 2018, p. 210).

The Saudi legal system defines this consumer as:
"An individual who engages in electronic commerce with the aim of obtaining goods or services provided by the service provider," where the person may be "either a natural or legal entity" (Al-Rahman, 2023, p. 2066).

In Algeria, the electronic consumer is defined in Article 5, paragraph 3 of Law No. 18-05 on Electronic Commerce as:
"Any natural or legal person who, for consideration or free of charge, obtains goods or services via electronic communication from an electronic supplier for final use" (Law No. 18-05, Article 6, 2018).

This consumer enjoys rights guaranteed both nationally and internationally. The International Consumer Rights Charter affirms eight fundamental rights: the right to safety, the right to choose, the right to information, the right to express opinions, the right to compensation, the right to basic needs, the right to education, and the right to live in a healthy environment.

Additional rights have emerged due to the digital context. Law 18-05 on electronic commerce highlights both general and specific rights. Among the most important is the right of withdrawal, which is a unique right given to electronic consumers. This right, uncommon in traditional contracts, aims to protect the consumer in a virtual environment.

In practice, this right is a key legal tool that ensures effective protection for the electronic consumer, especially as the weaker party in the transaction. The law allows the consumer to withdraw from a purchase within four working days from the actual delivery of the product, with a clear reason provided. The supplier must return the full payment within 15 days of the product's return. The consumer also retains the right to compensation in case of any damages (Law No. 18-05, Article 6, 2018).

Electronic consumer protection may be defined as: "A natural person who receives goods or services from a professional, for non-commercial purposes, whether for a fee or free of charge, through an electronic communication network" (Saeed, 2012, p. 2).

It is also described as: "Preserving the consumer's rights and protecting them from fraud, deception, or the purchase of counterfeit goods by using digital tools, which often have a broader impact than traditional methods" (Guich, 2022, p. 92).

Moreover, it may be understood as: "A service provided by the government or civil society to shield the consumer from commercial fraud, exploitation, or poor service due to monopolistic practices or unfair conditions" (Al-Baqour, Jaaija, & Nouman, March 30–31, 2021, p. 5).

Because the Electronic Consumer Is the Weaker Party

The electronic consumer is often seen as the weaker party in a contractual relationship. They usually seek to satisfy personal or family needs. This status makes it necessary to provide them with legal protection. Several reasons reinforce the importance of protecting their interests and rights, including the following (Al-Rumilat, p. 12):

- **Rising consumer demand** for goods and services that align with personal preferences. This increase is due to higher income levels, improved living conditions, and better education. However, producers often target a broad market without customizing their offerings for individual consumers. This leaves many consumers unsatisfied.
- **Consumers expect high quality**, but face decreasing real income and reduced purchasing power due to rising prices. This gap leads to frustration and dissatisfaction.
- **Lack of clear and sufficient information** about product features, service quality, or pricing often leaves consumers unable to make informed choices.
- **Low-income consumers** are more vulnerable. They often face fraud, price inflation, and low-quality goods.
- **Legal and political shifts** have made consumer protection a public interest. Governments are now more willing to intervene. Politically, supporting consumer rights has also become a way to gain voter support.
- **Psychological harm** may occur when consumers use certain products or services that cause emotional distress or harm.
- **Limited legal awareness** among many consumers prevents them from knowing their rights or understanding the legal tools available to protect them.

United Nations Principles for Online Consumer Protection

To respond to the global nature of the internet, the United Nations outlined a set of principles for consumer protection in digital environments. These principles support the creation of frameworks to safeguard consumers globally (Guich, 2022, pp. 97–98):

- **Fairness and equity**: Companies operating in virtual spaces must act with honesty. They should work to build consumer loyalty across all stages of the relationship, especially with vulnerable or marginalized groups. These values must be part of the company's core culture.

- **Fair business practices**: Online businesses must avoid illegal, unethical, or misleading practices. This includes aggressive sales tactics or unjustified harm to consumers.
- **Transparency and communication**: Businesses must provide full, accurate, and non-deceptive information about products and services. This is especially important for terms of sale and pricing. Such information must be easily accessible, regardless of the technology used.
- **Consumer education**:Companies should, when necessary, offer programs and tools that help consumers understand the risks associated with digital transactions. This is crucial in payment processes. Businesses must also offer relevant advice and support.
- **Privacy protection**: Companies must safeguard consumer privacy through clear policies and security measures. They should obtain consent before collecting or using personal data.
- **Complaint handling and dispute resolution**: Online businesses must provide fair, timely, and low-cost mechanisms to resolve consumer complaints. Disputes should be settled amicably whenever possible, and customer satisfaction should be a core aim.

Objectives of Electronic Consumer Protection

The main objectives of online consumer protection include the following (Al-Bakri, 2006, p. 237):

- **Protecting consumers** from fraud and deception practiced by producers or intermediaries during sales and exchanges.
- **Upholding consumer rights** and defending them from manipulation or exploitation in the market for goods and services.
- **Supporting low-income groups** by helping them access necessary goods and services.
- **Improving coordination** with business organizations. This allows such entities to access important consumer data, which they may otherwise lack due to limited communication capabilities.

Concluding Note

Protecting consumers online requires addressing the unique vulnerabilities of the digital environment. This includes defending their rights against cybercrime, securing their personal data, and ensuring that payments made by consumers reach the sellers without fraud or loss (Qadri, 2014, p. 116).

Section Four: Innovative Solutions for Consumer Protection in the Age of Information Technology and Artificial Intelligence

- **A Call to Technology Companies to Adopt Fair AI Practices**

As the reliance on intelligent systems grows in decision-making processes that directly impact individuals, it becomes essential to ensure these systems are developed to serve consumer interests and protect their rights. This approach supports the creation of a more just and sustainable consumer society.

- **Establishing a Strong Legal and Regulatory Framework**

There is a need for comprehensive regulation that protects consumers from potential exploitation or discrimination caused by artificial intelligence. Laws must be introduced to address the risks of AI, protect privacy, and secure consumer rights in AI-related interactions.

- **Promoting Consumer Self-Awareness** Many consumers lack awareness of their digital rights due to limited knowledge of new laws and regulations. Therefore, consumers must also take responsibility for educating themselves and others. This can be done by:
  - Learning about the risks associated with artificial intelligence and how it is used in products and services.
  - Supporting companies that demonstrate fairness, transparency, and accountability in their use of AI.
  - Voicing concerns about unfair AI practices and raising awareness about ethical AI use.
  - Participating in campaigns that promote fair AI and educate others on its dangers.

- Sharing knowledge and experiences with family, friends, and community members to improve system performance and ensure their needs are met.

- **Investing in Research and Development** Adequate investment is needed to support the development of AI algorithms that are guided by principles of fairness and consumer protection. These algorithms should help machines learn how to respect consumer rights and apply those learnings in real-world scenarios.
- **Awareness Campaigns and Specialized Platforms** Institutions and relevant authorities should run awareness campaigns to educate the public about the risks of AI and the importance of fair practices. This includes public media initiatives, educational programs, and collaborations with non-governmental organizations and private companies. Creating dedicated websites, guidebooks, and platforms can help consumers make informed decisions. Such efforts must be continuous and use both traditional and digital channels.
- **Government Oversight and Private Sector Accountability** Governments must monitor the use of smart technologies and ensure compliance with ethical and legal standards. Oversight mechanisms must be in place to regulate the development and application of AI systems in consumer markets.
- **Enhancing Collaboration Between Government, Private Sector, and Civil Society** Effective consumer protection requires cooperation between public institutions, private enterprises, and civil society. Through joint efforts, the fair and responsible use of AI in the public interest can be achieved.
- **International Cooperation** Cross-border collaboration is essential as digital transactions increasingly take place beyond national boundaries. Countries must work together to develop a unified legal framework for consumer protection in e-commerce. This would strengthen trust in the global digital economy.
- **Building a Flexible Legal Structure and Ensuring Practical Enforcement** From a legal perspective, protecting consumers in the digital age requires a dynamic framework that can adapt to rapid technological developments. The challenge is not only to draft new legislation, but also to create mechanisms that ensure effective enforcement. Legal gaps in some countries must be addressed with comprehensive laws that guarantee full transparency in digital transactions and safeguard consumer rights in technologies such as AI and blockchain.

In addition, practical enforcement of legal mechanisms is necessary. Institutions must be trained to apply the law efficiently. Legal awareness is also key. It is not enough to have regulations in place—there must be clear communication with the public to ensure every consumer knows their rights in the digital environment.

Section Four: Innovative Solutions for Consumer Protection in the Age of Information Technology and Artificial Intelligence

- **Harmonizing International Legal Systems for Consumer Protection** Most international transactions today are conducted over the global internet, which knows no borders. This worldwide reach highlights the need for a unified international legal framework. Such harmonization would help align the legal positions of contracting parties and extend legal protection to consumers globally.
- **Strategic Investment in Data Collection and Management** The performance of artificial intelligence depends heavily on the quality of the data it processes. To ensure reliable AI-driven outcomes, companies must invest in accurate data collection, proper organization, and secure storage. Inaccurate, insufficient, or biased data can lead to misleading outcomes, such as flawed customer segmentation, incorrect product targeting, or inappropriate pricing.
- **Ensuring Data Security Through Safety Programs** Collecting and using consumers' personal data is essential for many AI-based services, such as personalized content and product recommendations. However, this data raises serious privacy concerns for both consumers and regulators. Companies that rely on AI must comply with data protection regulations and ensure customer information is handled in a secure and ethical manner.

CONCLUSION

Artificial intelligence has emerged as a key driver of innovation and growth. As a branch of computer science, AI seeks to develop systems capable of imitating human cognitive functions such as learning, reasoning, perception, and adaptation. These systems can perform complex tasks without human intervention.

By encouraging investment in AI, societies can promote technological advancement and foster innovation. This can help build a future where technology and humanity work together to improve quality of life. AI-based services will become more integrated and efficient, enhancing the consumer experience and contributing to a more prosperous and advanced society.

However, the use of AI has also introduced significant challenges in consumer protection. These challenges demand greater legal and regulatory attention. Consumers now face new threats such as privacy breaches, misuse of personal data, and deceptive product information.

Consumer protection has long been a concern for both experts and governments. It is closely tied to social development, especially in the context of the digital economy and information-driven markets. The rise of AI has created an urgent need to study the risks faced by online consumers and identify appropriate protection measures. This is especially important given that many consumers lack access to sufficient information about the products and services they use. Without that knowledge, they cannot make informed choices or use these services effectively.

Therefore, a balance must be struck between technological innovation and the protection of consumer rights. AI should be guided in a way that benefits consumers and aligns with human values. When used responsibly, intelligent technologies can help meet essential needs, improve service delivery, and open new opportunities in vital sectors such as healthcare, education, and commerce.

Key Recommendations:

- **Enforce Legal Mechanisms Practically** Authorities must ensure that legal protections for consumers are applied effectively. Regulatory bodies should receive proper training to implement these laws with precision.
- **Raise Legal Awareness Among Consumers** Legal awareness is essential. It is not enough to have laws in place—consumers must be informed about their rights. Clear and consistent communication with the public is critical to ensure that everyone understands their position in the digital world.
- **Enhance International Cooperation** As cross-border digital transactions increase, countries must work together to establish a unified legal framework for consumer protection. Such cooperation would help build trust in the digital economy.
- **Develop Flexible Legal Regulations** Legal frameworks must evolve to reflect the rapid changes in AI and digital technologies. Laws should be adaptive and continuously updated to remain relevant in a fast-changing technological environment.
- **Provide Continuous Training for Users** Ongoing training is essential to help users understand how to use AI tools responsibly and effectively. This also reduces the risk of misuse and ensures safer digital engagement.

In conclusion, there are continuous efforts to improve the digital space in general and AI applications in particular. However, existing legal gaps and challenges in law enforcement—especially regulatory oversight—remain major obstacles. To address these issues, it is crucial to pass comprehensive legislation, promote legal awareness, and strengthen international cooperation. Only through such measures can we ensure a safer and more just digital environment for future consumers—one in which artificial intelligence plays a positive and constructive role.

Title of research article

Primary School as Part of the Life Path of a Visually Impaired Child

Vera Remazhevskaya
Ph.D. in Pedagogy, Associate Professor, Director
Inclusive Resource Center "Levenya", Lviv
Ukraine
E-mail: veraremazhevskaya@gmail.com

Issue web link https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html

Keywords Primary school, primary education, preschool pupil, impaired child

Abstract
This article provides a comprehensive examination of the inclusion of visually impaired children in primary school settings, focusing on three interrelated dimensions: the foundational conditions necessary for a successful educational experience, the specialized activities and interventions of inclusive resource center (IRC) staff, and the distinctive behavioral patterns of visually impaired children in classroom, social, and play contexts. The study emphasizes that successful inclusion requires flexible, individualized approaches that respond to the specific needs of each child and the dynamics of their family and school environment. Effective collaboration between parents, primary school teachers, and IRC staff is highlighted as essential for fostering a supportive and nurturing learning atmosphere. The article further explores the critical role of preparing sighted students for the arrival of a visually impaired peer, employing practical activities and simulations that enhance empathy, understanding, and cooperative engagement. Observational insights reveal that visually impaired children often require additional time for orientation, task completion, and social interaction, necessitating patience, attentiveness, and strategic pedagogical planning. The article also discusses common challenges, such as managing peer interactions, maintaining attention and engagement, and mitigating the potential for social isolation, offering practical recommendations for teachers and resource staff to facilitate positive outcomes. Ultimately, the study underscores that when inclusion is thoughtfully implemented, visually impaired children are not only integrated into classroom life but also contribute to a richer, more empathetic learning environment for all students. The findings highlight that successful inclusion extends beyond academic achievement, encompassing social-emotional development, independence, and lifelong skills acquisition.

Introduction

Employees of inclusion resource centers play a pivotal role in this process. They should not perceive themselves as absolute specialists in the education, upbringing, or rehabilitation of a blind child, nor as individuals who "know everything better." On the contrary, through collaboration with schools, staff have the

opportunity to enhance their professional skills and gain practical experience. They observe the blind child's behavior in various activities and provide appropriate support when necessary.

The article also addresses specific aspects of a blind child's behavior in unfamiliar environments and strategies to manage these situations; approaches to create a comfortable learning environment for both blind and sighted children; and the benefits a blind child derives from successful inclusion, including engagement in real-life activities and meaningful social interactions with peers.

In Ukraine, the inclusion of a visually impaired child in mainstream general education institutions remains a significant event, despite common societal perceptions. True inclusion is understood as belonging and cohabitation rather than temporary coexistence under the same roof of blind and sighted children. It occurs when the child does not feel exceptional, can feel comfortable, make friends, and explore new, interesting, or challenging experiences openly rather than behind closed doors (Greiner, et al. 2023).

This article specifically examines three aspects of primary school inclusion for children with visual impairments:

1. The necessary conditions for a visually impaired child to have a successful school experience;
2. The concrete activities of inclusive resource center staff in facilitating the child's inclusion in primary school;
3. The behavioral characteristics of a blind child during play, communication, and learning, and their influence on peer relationships, providing insight into the "life of the class from within."

The discussion is based on the author's own observations of blind children's inclusion and integration, the experiences of colleagues from several European countries, and the results of a nationwide pedagogical experiment conducted at the municipal Inclusive Rehabilitation Center "Levenya" under the Lviv Regional Council. Inclusion remains distinctive and important not only for blind children but also for children with low vision in mainstream educational settings.

1. The First Primary School Experience for a Blind Child

The first visit to primary school represents, for both blind and sighted children, the first significant step beyond the family or preschool environment (assuming the child attended preschool), as well as the first social contact with a large number of people. For a blind child, who is often raised under conditions of close maternal care and hyperprotection, this process of separation from parents and familiar preschool surroundings is particularly critical (BArdin, et al. 2021).

Primary school becomes the child's first major "social organization" after preschool and their first real integration into the sighted world. It is also the setting in which the child first experiences a sense of being "different" — referred to as "being blind." This environment provides the first potentially painful experiences, the initial self-awareness, and the first internal conflict arising from the recognition of "I am different," while simultaneously offering the opportunity to interact with sighted peers over many years (Koehler, et al. 2017).

2. Role of Primary School in Developing Self-Esteem

Attendance at primary school can significantly contribute to the development of a blind child's self-esteem. The child may gain confidence in the understanding that "despite my lack of vision, I can achieve," or even "I can do it; I am blind."

Several key factors must be considered for the successful inclusion of a blind child in mainstream primary education. The choice of school requires adequate time and reflection; proximity to the family's residence does not always equate to the best fit. Inclusive resource center staff can support parents in selecting an appropriate school. Preliminary discussions with school personnel are necessary during this selection process.

3. Seeking Understanding from School Personnel

It is essential to seek understanding not only from the classroom teacher but also from school leadership and the relevant educational management authorities, as these entities will provide concrete support to teachers over time.

Advance briefing of teachers and other educational staff is critical. School personnel must understand what including a blind child entails in terms of time commitment and dedication, as well as where to seek assistance (e.g., visits from inclusive resource center staff, parental support). Teachers can commit to inclusion only when fully informed, enabling them to consciously explain their readiness to work under new, complex conditions with new content and methods. Based on experience, such preliminary information often serves as the first form of support for teachers, helping to reduce anxiety and foster confidence, even though "real inclusion" may prove to be quite different than initially imagined (Porter, et al. 2015).

4. Teacher Flexibility and Adaptation

For meaningful interaction between blind and sighted students, teachers must be willing to abandon daily pedagogical stereotypes, demonstrating flexibility, creativity, and patience. They should seek practical solutions to emerging challenges, such as gradually introducing the child to the school's daily rhythm, adapting to new expectations, the peer group, and the broader school environment. Initial compromises, such as allowing parents to stay briefly in the classroom, must eventually be reassessed and phased out.

5. Parental and School Collaboration

Successful inclusion depends on strong collaboration between parents and primary school staff. From the parental perspective, this includes:

1. Consistent support of their child throughout the educational process.
2. Willingness to compromise and address each situation flexibly, avoiding rigid expectations such as "every lesson, every activity, and every game must be the same for all children — my blind child must never fall behind."

From the school's perspective, educators must be attentive and tactful in interactions with the parents of a blind child, who are often highly vulnerable due to previous negative experiences with other teachers, medical professionals, or community members.

6. Open Communication with Sighted Children's Parents

Practical experience shows that open, comprehensive communication with the parents of sighted children about the blind child's abilities and challenges is essential for successful inclusion. Without such information, parents may fear that their child will receive "less attention" after the blind child joins the class. These concerns are legitimate and must be openly discussed and seriously addressed. Continuous dialogue between school staff and all parents produces positive outcomes; sighted children's parents begin to recognize the benefits of inclusion for their own children, including social development, life experience, tolerance, and empathy.

7. Preparing Sighted Students for the Arrival of a Blind Child

An essential prerequisite for a successful start and ongoing inclusion is the preparation of sighted students for the arrival of a blind child in the classroom. This preparation should include not only discussions and factual information but also relevant games in which children experience the situation of "I cannot see." Children should be introduced, in an age-appropriate manner and without taboos, to the perception of the world without vision, with continuous commentary on situations that occur daily in lessons and extracurricular activities during the blind child's presence in the class (Pliner, 2009).

The class selected for inclusion should not be excessively large, allowing for flexibility and individualized attention. For example, during the first days of school attendance, it is advisable to limit the number of lessons. Another important condition is the presence of dedicated personnel in the classroom, such as a teacher's

assistant trained to work with a blind child. Innovative solutions could include shift-based support from other school staff (e.g., psychologists, social educators), student interns, volunteers, or other resources to supplement staff.

8. School Environment and Teacher Support

The physical school environment and interior are secondary factors for successful inclusion. Experience shows that well-educated, fully included children can thrive even in compact classrooms with minimal furnishings, provided the school actively implements the principles of inclusive pedagogy. The key focus is "teaching for life" as a core educational concept.

Feedback from teachers indicates that opportunities for professional development and, if desired, supervision are crucial for successful inclusion throughout the blind child's schooling. Teachers report that support and exchanges with colleagues who also teach blind children provide practical assistance, reduce stress, and stimulate new ideas. Solidarity and shared experience reassure teachers that "we are not alone in our attempts to integrate a blind child into the general educational environment." (Mushoriwa, 2009)

9. Role of Inclusive Resource Center (IRC) Staff

In facilitating successful inclusion, IRC staff plays a pivotal role. They should not consider themselves absolute specialists in the education, upbringing, or rehabilitation of blind children, nor claim to "know everything better." On the contrary, collaboration with schools allows IRC staff to refine their expertise, observe the child's behavior in various activities, and provide appropriate support when necessary.

It is important for teachers to understand that IRC staff does not impose strict requirements for individualized instruction based solely on principles of specialized blind pedagogy. Simply enabling a blind child to participate in a classroom with sighted peers is already a significant challenge that demands high professional standards from educators.

10. Practical Measures for Inclusion

Over years of collaboration between the "Levenya" Rehabilitation and Educational Center and mainstream schools, a structured "List of Proposals for Cooperation and Support" has been developed. These proposals function like a LEGO set: some elements are core, others auxiliary, and they can be implemented as needed. Key measures include:

1. **Providing Information:**
    - On ocular diseases, their impact on visual perception, orientation in space, preventive measures, and basic principles of spatial orientation and mobility.
2. **Consultation with Teachers:**
    - Discussing behavioral traits and challenges of the blind child, including crisis situations.
    - Exploring pedagogical strategies and solutions to everyday classroom scenarios (e.g., managing bathroom breaks, meals, or allowing the blind child to be temporarily alone in class).
3. **Classroom Observation:**
    - IRC staff observe the child during lessons, individual activities, and recess.
    - Supporting classroom setup, including creating accessible routes (cloakroom–classroom, classroom–toilet, classroom–cafeteria, classroom–gym) and marking furniture with tactile indicators.
4. **Individual and Small Group Activities:**
    - Conducting individual sessions to relieve classroom pressure and prepare the child for group participation.
    - Working with small groups of 3–4 children to foster peer cohesion and adjust behaviors in stressful situations.
5. **Teacher Support:**

- Assisting in selecting didactic materials and adapting the learning environment.
- Recommending appropriate literature, educational videos, and conducting workshops or meetings for primary school teachers and staff from other schools.

6. **Parental Liaison**:
   - Serving as a communication link between the school and the parents of the blind child, addressing not only conflict situations but also facilitating ongoing collaboration and information sharing.

These elements collectively support the blind child's successful inclusion, promote teacher confidence, and enhance the social integration of all students in the classroom.

Category	Description / Activities	Purpose / Expected Outcome
Classroom Preparation	Limit number of children; flexible scheduling for first days	Reduce stress and allow gradual adaptation for the blind child
Information for Sighted Students	Discussions, factual information, games simulating "I cannot see" situations	Help children understand visual impairment and foster empathy
Support Staff	Teacher assistant trained to work with blind students; psychologists, social educators; volunteers; student interns	Provide additional guidance, reduce teacher workload, ensure safety and effective inclusion
IRC Staff Role	Partner with school; do not impose rigid methods; observe child; provide consultation and support	Facilitate collaboration, provide specialized knowledge, enhance teacher confidence
Professional Development & Supervision	Training opportunities, peer consultation, experience sharing	Improve teachers' skills, encourage solidarity, generate new ideas for inclusion
Information Sharing	Eye diseases, visual perception, spatial orientation, preventive measures, orientation & mobility basics	Ensure staff and students understand child's needs and capabilities
Teacher Consultation	Discuss behavioral characteristics, difficulties, and crisis management strategies	Develop individualized strategies and anticipate potential challenges
Classroom Visits by IRC Staff	Observe child in class and during activities; assist in classroom setup; develop navigation routes; create supportive tools	Ensure safe and effective learning environment; teach classmates how to interact
Individual Sessions with IRC Staff	Lesson relief; preparation for group activities	Support learning, reduce stress, build skills
Small Group Activities	3–4 children working together	Promote peer interaction, adjust behavior in stressful situations
Collaboration in Materials & Space	Select didactic materials; adapt learning space; provide literature and videos; conduct seminars	Improve accessibility and teacher knowledge, exchange best practices
IRC as Liaison with Parents	Facilitate communication; support conflict resolution	Ensure coordinated support and understanding between school and family

Preparing Sighted Students for the Inclusion of a Blind Child in the Classroom

A critical prerequisite for a successful start and ongoing effective inclusion is preparing sighted students for the arrival of a blind child in the classroom. This preparation should involve not only discussions and factual information but also appropriate games where children experience situations like "I cannot see." Information should be presented in a child-friendly manner, without omissions or taboos, explaining the perception of the world without sight. During the blind child's stay in the classroom, teachers should comment on situations arising daily during lessons and extracurricular activities.

The classroom selected for the inclusion of a blind child should not be overcrowded. It is important to maintain flexibility and an individualized approach. For example, during the first days of school attendance, it is advisable to limit the child's engagement to a few lessons. Another essential condition is the presence of

mandatory support staff in the classroom attended by the blind child. For instance, this could include a teacher's assistant trained to work with visually impaired students. Additional strategies might involve "shift work" for supplementary educational personnel from the school staff (psychologists, social educators), support from student interns, volunteers, and other possibilities to find extra personnel.

I am convinced that the school building and its interior are secondary considerations for the successful inclusion of a blind child in primary school (although this may acquire greater importance in modern contexts). I have encountered well-educated, "fully included" children—in the best sense of the word—in small spaces with nearly empty shelves, in schools striving to implement the very idea of inclusive pedagogy. In this sense, the concept of "teaching for life" was a guiding principle of the educational institution.

Feedback from teachers indicates that opportunities for professional development and, if desired, supervision are crucial prerequisites for the success of the blind child's inclusion throughout their school years. Educators describe the assistance and relief they experience when consulting with colleagues who also have blind students in their classrooms. Sharing experiences always sparks new ideas; it is crucial to feel solidarity and know that "we are not alone in our attempts to integrate a blind child into the general educational environment."

When seeking and implementing measures critical to the successful inclusion of children with special educational needs, inclusive resource center (IRC) staff can provide significant support through consultations, guidance, accompaniment, and information sharing. Before detailing specific measures to assist with the inclusion of a blind child in primary school, it is essential to recognize the role of the inclusive rehabilitation center (IRC) staff as partners and the undeniable necessity of cooperation between the IRC and general education institutions.

IRC staff should not consider themselves absolute specialists in teaching, educating, or rehabilitating blind children, nor should they assume they "know everything better." On the contrary, through collaboration with the school, IRC staff has the opportunity to improve their own skills and gain experience: to study the blind child more closely, observe their behavior in various activities, and, if necessary, offer appropriate support. Teachers benefit from knowing that IRC staff does not impose requirements to work constantly with the blind child "individually and according to typhlopedagogical principles." Allowing a blind child to participate in a classroom with sighted peers is already a significant challenge and requires high professional standards from educators.

Over years of cooperation between the Levenya Rehabilitation Center and general education institutions regarding the inclusion of children with visual impairments, we compiled a "List of Proposals for Various Forms of Collaboration and Support." These proposals can be applied as needed. Similar to playing with a LEGO set, where each element has a purpose, some proposals are fundamental, while others serve a supportive role. Below is a list of these "construction elements":

- **Providing Information:** Information about eye diseases, their impact on visual perception, spatial orientation, necessary measures for preventing visual impairment, and the basics of orientation and mobility.
- **Discussions with Teachers About the Child:** Focus on the child's behavioral characteristics and challenges, including crisis situations. Discuss pedagogical situations and concrete ways to address them in daily school life (e.g., "How to organize routines like using the toilet or eating?" or "Should the blind child be allowed to have private time in class? If so, for how long and how often?").
- **Classroom Visits:** Allow the teacher to observe the blind child interacting with other educators (IRC staff conduct corrective and developmental activities with the child). Conduct individual sessions with the blind child in other areas of the school. Collaborate with the teacher to arrange the classroom environment. Develop navigation routes for the blind child (e.g., changing room–classroom, classroom–toilet, classroom–cafeteria, classroom–gym). Develop supportive tools to locate lockers, desks, and sinks (special labels, tactile markers, etc.).
- **Purpose of IRC Visits to the School:** Observation of the child in different situations and routine activities; participation in lessons, games, and breaks (demonstrating to sighted children how to interact with a blind child). Specially simulated situations help understand the blind child's role in the classroom and allow joint analysis with the teacher.

- **Individual Sessions with IRC Staff:** Used for lesson relief and preparing the child for upcoming joint classroom activities.
- **Small Group Activities (3–4 Children):** Encourage peer cohesion, modify behaviors in stressful situations as appropriate.
- **Support from IRC Staff Together with Teachers or Assistants:** Assist in selecting didactic materials, adapt learning spaces for the blind child, provide relevant literature and educational videos, conduct specialized seminars and meetings for teachers across different institutions to exchange experience and discuss special cases.
- **IRC as a Liaison:** Acts as a link between the primary school and the parents of the blind child, addressing not only conflict situations but also routine communications.

Recommendations

Based on the observations and analysis presented in this study, the following recommendations are proposed to enhance the inclusion of visually impaired children in primary school:

1. **Preparation of Sighted Students**: Conduct structured orientation activities, role-playing games, and discussions to familiarize sighted students with visual impairments, promoting empathy and cooperation.
2. **Individualized Educational Plans**: Develop flexible and adaptive learning strategies that address the unique needs of each visually impaired child, including additional time for tasks, personalized instructions, and tailored classroom materials.
3. **Collaboration and Communication**: Strengthen cooperation between teachers, parents, and inclusive resource center (IRC) staff to ensure consistent support and alignment of educational goals and strategies.
4. **Resource Staff Engagement**: Utilize IRC professionals for classroom support, observation, and guidance in teaching methods, spatial orientation, mobility, and social integration.
5. **Peer Interaction Facilitation**: Organize structured group activities and peer-assisted learning to enhance social inclusion and reduce potential isolation or misunderstandings.
6. **Environment and Accessibility Adjustments**: Adapt classroom layout, furniture, and learning materials to facilitate orientation, independence, and safety for visually impaired children.
7. **Professional Development**: Provide teachers and support staff with specialized training in inclusive pedagogy, braille literacy, assistive technologies, and strategies for managing diverse classroom behaviors.
8. **Continuous Monitoring and Feedback**: Implement regular observation and feedback sessions to assess progress, address emerging challenges, and adjust inclusion strategies in real time.

Conclusion

The inclusion of visually impaired children in primary schools is a multifaceted process that demands careful planning, individualized approaches, and sustained collaboration between families, teachers, and IRC professionals. Successful inclusion is not solely about academic achievement; it encompasses social-emotional growth, self-confidence, and the development of essential life skills. By preparing sighted peers, fostering empathy, and providing adaptive support mechanisms, schools can create an environment where visually impaired children actively participate and contribute meaningfully to classroom life. Observations from inclusive settings demonstrate that children with normal vision also benefit profoundly, gaining enhanced understanding, tolerance, and social awareness. Ultimately, thoughtful and structured inclusion not only facilitates the development of visually impaired children but enriches the educational experience for all students, supporting the creation of inclusive, compassionate, and resilient learning communities.

Acknowledgements

The author expresses gratitude to the staff of the Inclusive Resource Center "Levenya" for their dedication and invaluable support in observing and facilitating the inclusion of visually impaired children. Special thanks are extended to the teachers, parents, and students who participated in the study and shared their experiences, making this research possible. The collaborative spirit of all stakeholders has been fundamental to understanding the complex dynamics of inclusive education in primary schools.

Conflict of Interest

The author declares no conflict of interest. All observations, interpretations, and recommendations presented in this article are based on professional experience and research conducted independently.

Issue web link	https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html
Keywords	Criminal evidence, judicial reasoning, evidentiary fallacies, presumption of innocence, public opinion, impartiality, legal certainty, fair trial.

Abstract

Criminal justice is fundamentally grounded in certainty, with the judge's conviction forming the cornerstone of public trust in judicial rulings. Evidence serves as the primary means to reach that certainty, making the theory of proof the foundation upon which fair criminal adjudication is built. Justice is only realized when judges adhere strictly to legally established rules of evidence, and when the prosecution substantiates its claims with valid, objective proof. Avoiding evidentiary fallacies is therefore essential; as such errors can compromise the fairness of criminal judgments. Among these are: the overly broad interpretation of criminal statutes, biased selection or evaluation of evidence, reliance on personal knowledge, public opinion, or rumor. Other fallacies include the reversal of the presumption of innocence, undue emphasis on appearances, unexamined confessions, or the weight given to a single testimony. A fair trial demands that judges maintain impartiality, resisting influence from extraneous or unlawful factors. Ultimately, rulings must rest solely on admissible, well-examined evidence, thus safeguarding the integrity of the justice system and upholding both fairness and legal certainty in criminal proceedings.

Introduction

Technological advancement is one of the most pressing topics that has attracted the attention of many researchers in the legal field. This is due to its profound negative impact on societies, particularly with the recent emergence of artificial intelligence. While this advancement has brought about significant positive changes, it has also become a potential threat to societal security. Among the most notable AI technologies is **nanotechnology**, which focuses on studying, understanding, and manipulating matter at the nanoscale. This technology finds applications in several scientific fields such as physics, chemistry, engineering, and beyond.

Although nanotechnology has existed for quite some time, it did not begin to flourish and evolve significantly until around 1981. Since then, it has witnessed remarkable development.

It is undeniable that nanotechnology offers considerable practical benefits. It plays a vital role in enhancing various sectors including information technology, medicine, energy, security, environment, food safety, and more. In fact, it has even been integrated into products used directly by consumers. However, the use of such technology also poses serious risks, as it has been linked to the emergence of various forms of crime. On this basis, we raise the following research question:

What are the forms of crimes arising from the use of nanotechnology?

To address this issue, we have divided the study into the following sections:

Section One: Nanotechnology-related crimes affecting state security

Section Two: Nanotechnology-related crimes affecting property and individuals

Section One: Nanotechnology-Related Crimes Affecting State Security

Nanotechnology-related crimes that target state security are among the most dangerous to society. Threats to the state and its stability have profound implications not only domestically but also internationally. These crimes can be categorized as follows:

Subsection One: Crimes Affecting High-Level State Institutions

The world has witnessed various crimes targeting senior state institutions, posing direct threats to national safety and stability. Among these are:

1. Cybercrimes

The Algerian legislator has used two main terminologies to refer to cybercrime. The first is "crimes against automated data processing systems," introduced by Law No. 04-15 amending the Penal Code. Later, another term was adopted: "crimes related to information and communication technologies," which appears in Law No. 09-04 concerning the specific rules for preventing and combating crimes related to ICT.
[1]

Nanotechnology can be employed in acts of espionage and surveillance, such as planting highly miniaturized sensors in sensitive locations to collect information without detection. It can also be used in

[1] *Habet Amal, "The Role of the National Body for the Prevention and Combat of ICT-Related Crimes," International Journal of Legal and Political Research, Vol. 5, No. 3, Algeria, 2021, p. 466*

forgery, such as producing counterfeit documents or currency that is nearly impossible to detect due to advanced protective applications.

These crimes represent serious obstacles to state development due to their significant impact on essential state functions.

Information technologies have permeated nearly all aspects of life in both developed and developing countries. Today, IT systems organize transportation, communication, economic transactions, industrial and agricultural inputs, education, healthcare, and even military operations. As a result, crime has evolved: modern criminals now utilize advanced technologies to commit crimes far beyond the traditional scope.

The subject of this research is cybercrimes and their evidentiary challenges—i.e., crimes committed via computers and the Internet.[2]

Perpetrators of cybercrimes may infect computer systems with malicious software to damage or disable them, delete or steal data, or disrupt services. They might also prevent users from accessing websites or networks, or block a software provider from reaching its clients—a tactic known as **Denial-of-Service (DoS) attack**.

Moreover, criminals may use computers to distribute malware, illicit information, or illegal images. Often, they simultaneously use infected devices to propagate viruses across networks. Some jurisdictions also recognize crimes where computers are merely tools used in the offense, such as storing stolen data.

2. Terrorism-Related Crimes

Nanotechnology-related terrorism is perhaps the most alarming due to its multifaceted and highly destructive nature. Examples include:

a. Infrastructure-Based Extortion

Nanotechnology can be used to develop materials capable of causing physical damage to critical infrastructure—such as corroding bridges or destroying industrial pipelines—through methods that are difficult to detect. Criminals may leverage such technologies to extort governments or inflict economic harm.

b. Nano-Weapons

Miniaturized and highly precise weapons developed through nanotechnology can be extremely difficult to detect. Toxic nanoparticles could be used in assassinations or acts of terrorism.

c. Cyber-Terrorism and Advanced Viruses

Nano-enabled computer viruses can become increasingly complex and difficult to detect or eliminate. These may be used to extort corporations or individuals by threatening to compromise or disable their systems.

d. Advanced Concealment and Camouflage

Materials that change color or properties at the nanoscale may be used to disguise individuals or objects, enabling the execution of crimes without detection of the perpetrator or tools involved.

E- Causing Disruptions in Electrical Networks

Nanodevices can be developed to emit electromagnetic signals that affect electrical networks or control systems, leading to power outages or unexpected disturbances. Such disruptions may be exploited by terrorist cells around the world to cause chaos or exert pressure on critical infrastructure.

Subsection Three: Causing Severe Environmental Damage

[2] *Abdul Jabbar Awad and Talib Abbas, "Cybercrimes and Their Proof," Journal of Rafidain for Legal and Political Sciences, Vol. 4, No. 6, Jordan, 2021, p. 421*

The environmental risks of nanotechnology remain poorly understood, primarily due to the extremely limited funding allocated to this area of research. For example, in 2006, the U.S. government spent 33% of the National Nanotechnology Initiative's $1.3 billion budget on military applications, while only $11 million (approximately 0.0085%) was dedicated to research on the health and environmental risks of nanotechnology.

Despite the scarcity of such studies, the few that do exist often yield conflicting and sometimes alarming results. Some preliminary research has shown that certain nanomaterials already widely used in commercial products may pose toxic risks to the environment and human health.

For instance, studies have revealed that fullerene particles (buckyballs) may cause brain damage in fish species commonly used as models for environmental toxicity. Additionally, by-products of the manufacturing of single-walled carbon nanotubes have been found to be lethal to certain types of crustaceans.

The antimicrobial properties of some nanomaterials have raised concerns that nanotechnology might disrupt microbial activities essential to environmental balance, such as nitrogen-fixing bacteria and other beneficial microorganisms. This scenario holds serious ecological implications and significant economic consequences. Further, early studies suggest that plants may be capable of absorbing, modifying, and accumulating nanoparticles, which could then propagate through the food chain.[3]

Subsection Four: Causing Severe Health Hazards

In the early 2000s, scientific studies began to reveal the toxic potential of nanomaterials. Due to their unique properties, nanoparticles may pose significant health risks to humans. As noted by Marc Audétat, a researcher at the Science and Society Department of the University of Lausanne, nanotechnology has been promoted over the past two decades as a scientific revolution with the capacity to enhance production processes and advance electronics, medicine, renewable energy, and agriculture.

However, the risks and uncertainties surrounding this new and tangible technology have prompted the Swiss Consumer Protection Association, in collaboration with the University of Lausanne, to launch awareness campaigns aimed at promoting public discourse on the benefits and drawbacks of nanotechnology. This is particularly important given that the majority of consumers remain unaware of the technology's potential dangers.

Biologist Houma Khamis, an expert in nanotechnology at the Swiss Consumer Protection Association, explained:

"Some materials, when reduced to nanoscale dimensions, exhibit altered properties. For example, titanium dioxide, which is normally used as a white pigment, becomes transparent and acts as a UV filter when reduced to nanoparticles."

While the results of this technology are remarkable and often unpredictable due to the sensitivity of nanoparticles—where even a single additional or missing atom can fundamentally alter their properties—they interact easily with their environment due to their large surface area. Therefore, despite widespread use, research on the health effects of nanotechnology on consumers remains limited. This scarcity of data, combined with growing concerns, was highlighted in a 2004 study by the British Institute, which warned about the dangers of nanotech and called on governments and NGOs to address its potential negative impacts.

As such, before integrating this technology into all sectors—especially those related to consumer health and safety or the surrounding environment—there must be regulatory oversight. Presently, there are no clear or

[3] Brar, S., Verma, M., Tyagi, R., & Surampalli, R. (2009). Nanoparticles. Contaminants of Emerging Environmental Concern, pp. 416–445.

specific regulations addressing the risks associated with nanotechnology. As a result, general principles concerning[4]

In this context, the World Health Organization, civil society organizations, and interested governments have held and continue to hold conferences to examine the latent dangers of nanotechnology. In some respects, this technology may be like "poison in honey." For example, in 2008, the first global conference addressing the health risks of nanotechnology was held in Brussels. The conference concluded that nanotechnology is a double-edged sword. Despite its many advantages, it poses significant and, as of yet, poorly defined threats to human health.

One of the most alarming risks is that nanoparticles with diameters of 300 nanometers or less can easily penetrate the human body and reach cells. Even more concerning is that particles of 70 nanometers or smaller can enter the cell nucleus, potentially causing toxicity or altering cellular function. Due to their tiny size, conventional protective gear—such as masks and respirators—are ineffective in filtering them out.[5]

Subsection Two: Nanotechnology-Related Crimes Affecting Society

Nanotechnology also negatively impacts society through various forms of crime. In this section, we explore several of these criminal implications:

1. Impact on Human Activities

Nanotechnology affects different aspects of human activity in multiple ways:

[See: Abdul Jabbar Awad and Talib Abbas, op. cit., p. 456]

a. Agricultural Disruption:

Nanotech can be used to compromise agricultural productivity, either by reducing crop yields or introducing targeted nanodiseases, which in turn can jeopardize food security.

b. Infiltration of Biological Systems:

Through nanoscale engineering, the biological systems of microorganisms or insects can be targeted—for example, altering insect behavior to become more aggressive or more effective disease vectors.

c. Disease Transmission via Nano-Injection:

Undetectable nanoinjection devices can deliver toxins or viruses to specific individuals, making the crime both hard to detect and nearly impossible to trace back to a perpetrator.

d. Production of Carcinogenic Nanomaterials:

Nanotechnology can be employed to create materials that interfere with biological systems in a way that increases cancer risk among exposed populations.

e. Environmental Nano-Chemical Attacks:

Releasing nanochemicals into the natural environment may lead to excessive pollution or harmful changes, such as groundwater contamination or air toxicity.

f. Memory and Cognitive Manipulation:

Specific nanomaterials may be designed to affect neural cells or neurotransmitters in the brain, enabling illegal manipulation of memory or behavior.

2. Impact on Other Societal Activities

Additional forms of nanotechnology-related crimes affecting society and the state include:

[4] Bouhouia Amal & Omran Aisha, "The Impact of Nanotechnology on Consumer Health and Safety under Algerian Consumer Law," Al-Ustadh Al-Bahith Journal for Legal and Political Studies, Vol. 4, No. 2, Algeria, 2019, pp. 1298–1299.
[5] Mohamed Magdy Wasel, Introduction to Nanoscience, For University Publishing House, Egypt, 2008, p. 45

a. Nano Attacks on Sensory Devices:

Using nanomaterials that interfere with vision or hearing devices, it is possible to disrupt or degrade their performance, impairing individuals' ability to perceive the environment.

b. Manipulation of Artificial Intelligence via Nanodust:

Nanoparticles can be used to infiltrate AI systems or corrupt training data, leading to incorrect outputs or biased decisions in automated systems.

c. Development of Nano-Hacking Tools:

Nano-sized hacking devices can be employed to gain unauthorized access to user data or critical network infrastructure without leaving a detectable trace.

d. Economic Sabotage through Nanotechnology:

Nanotech can alter the physical properties of commercial goods—such as reducing durability or affecting quality—which results in substantial losses for businesses and harms consumer trust. This, in turn, poses a serious threat to economic stability, society, and the individual alike.

Section Two: The Role of Nanotechnology in Criminal Evidence

Nanotechnology is a field that intersects with nearly all branches of science and engineering. With rapid advancements in areas such as molecular electronics, biomolecular motors, and DNA-based self-assembly, the applications of nanotechnology are broad and ever-expanding. The term was first coined in 1974 by Japanese scientist **Norio Taniguchi**, a professor at the Tokyo University of Science, to refer to the precise fabrication of materials at the nanometer scale.

In truth, nanotechnology has many valuable uses in the field of **criminal evidence**, and this section will explore those in detail.

Section I: Forms of Nanotechnology Use in Crime Detection

As nanotechnology evolves and expands into various fields—including materials science, atomic energy, biology, pharmaceuticals, cosmetics, biotechnology, tissue engineering, informatics, IT, environmental protection, agriculture, food safety, and health risks—it has also begun to influence forensic science significantly. Applications of modified nanomaterials in forensic investigation include techniques such as:

- High-Performance Liquid Chromatography (HPLC)
- Scanning Probe Microscopy (SPM)
- Infrared Spectroscopy
- X-ray Photoelectron Spectroscopy (XPS)
- Time-of-Flight Mass Spectrometry (ToF-MS)
- Atomic Force Microscopy (AFM)

These tools have revolutionized forensic science by enabling detection and analysis of evidence at the nanoscale. For instance, nanomaterials such as **gold nanoparticles (Au-NPs)** are used in forensic investigations to reveal fingerprints, footprints, DNA traces, explosive residues (via nanosensors), or even "brainprints" that may store crime-related memories.

These novel properties of nanomaterials significantly aid in the **collection, discovery, and establishment of criminal evidence** through nanotechnology.[6]

[6] *Andan Prasada, Sally Lokusib, Lalit Prasada, "Emerging Forensic Applications in Nanotechnology," International Journal of Engineering and Applied Sciences (IJEAS), Vol. 2, Feb 2016, School of Basic and Applied Sciences, Galgotias University, Greater Noida, Uttar*

Subsection I: Nanotechnology and Forensic Medicine

Forensic medicine is a field dedicated to elucidating medical issues presented before the judiciary. With nanotechnology, the study of forensic materials has shifted to the nanoscale using advanced instruments that can manipulate molecules with extreme precision.[7]

Nanotechnology can be employed in:

- **Estimating time of death**
- **DNA analysis**
- **Fingerprint comparison**
- **Bloodstain pattern analysis**

Technological advancements have expanded the boundaries of what is possible in **detecting and proving criminal acts**, especially in modern, complex crimes. The future promises even greater reliance on nanotechnology, particularly in **reconstructing crime scenes**, **rebuilding atoms and molecules**, and **establishing the identity of suspects** based on the smallest traces of evidence.[8]

Subsection II: Lie Detection Technology in Criminal Evidence

The **polygraph** (lie detector) is a modern scientific tool used in criminal investigations to identify deception. It works on the premise that lying causes unique psychological and physiological responses—such as changes in heart rate, perspiration, and blood pressure—that can be measured via involuntary bodily functions.

While some countries like **Algeria, Poland, Russia, and Norway** prohibit its use, others such as **Sweden** permit it, though only in criminal matters and under specific conditions.

Legal scholars have long debated the **legitimacy of polygraph results** in criminal cases, with opinions ranging from strong opposition to cautious acceptance. Algerian jurisprudence largely rejects the use of polygraphs, citing concerns over **violations of the defendant's rights**, including the **right to remain silent** and **freedom of defense**.

Compelling a defendant to undergo polygraph testing without consent renders the process invalid. Courts in **France and the UK**, along with international treaties and conferences—such as the **European Scientific Section in Brussels, 1951**—have emphasized the **inadmissibility of coercion and the importance of protecting human rights**.

According to Interpol's Mr. Roeck, member states are warned against the use of lie detectors, especially if they involve psychological pressure or physical coercion. However, he notes that polygraphs may be used **under two conditions**:

1- The defendant's voluntary consent

2- The results are not used as direct evidence of guilt[9]

Section II: Evidentiary Value of Nano-Based Evidence

The admissibility of nanotechnology-derived evidence has sparked **significant debate** among legal scholars and across legal systems. Jurisdictions that do recognize such evidence typically do so within the framework of **judicial discretion**.

Pradesh, India, p. 7

[7] *Jadoui Sidi Mohamed Amin, "Nanotechnology and Its Role in Criminal Evidence," Eliza Journal for Legal and Political Research, Vol. 8, No. 1, Algeria, 2023, p. 172*

[8] *Omar Abdel-Majid Musbah, "The Role of Bloodstains in Crime Detection Using Nanotechnology," Arab Journal of Security Studies, Vol. 30, No. 61, Saudi Arabia, 2014, p. 35*

[9] *Jadoui Sidi Mohamed Amin, op.cit pp. 174-175*

Subsection I: Judicial Discretion in Evidence Evaluation

In criminal proceedings, the **principle of the judge's personal conviction** governs the evaluation of evidence. This principle results in two key outcomes:

1- The judge is free to accept any form of evidence, unless otherwise restricted by law

2- The judge has absolute authority to weigh the credibility and sufficiency of the evidence presented

However, such conviction must be based on **certainty and logical coherence**—the evidence must be consistent, complete, and free of contradiction. The judge must examine all elements thoroughly.

Algerian legislation affirms this principle in **Article 212(1) of the Code of Criminal Procedure**, which states:

"Crimes may be proven by any means of evidence, except in cases where the law provides otherwise. The judge may issue a ruling based on his personal conviction."

Thus, Algerian law, in line with other legal systems, subjects all evidence—including that derived from nanotechnology—to the judge's discretionary evaluation.[10]

Subsection II: Limitations of Judicial Discretion

Despite the general rule, there are several important exceptions where judicial discretion is restricted:

1- **Adultery Offenses:**

Under Algerian law, adultery can only be proven by (a) a flagrante delicto report by judicial police, (b) the accused's confession, or (c) judicial admission. Therefore, nanotechnology-based evidence is **inadmissible** in such cases.

2- **Non-Criminal Matters:**

When a criminal ruling depends on determining a **civil issue** (e.g., establishing a contractual relationship), the judge must follow **civil evidentiary rules**, not the general rules of criminal procedure.

3- **Exclusion of Certain Evidence:**

Some forms of evidence are **inadmissible** in criminal cases if they violate the defendant's right to a fair trial. For example, a letter sent by the accused to their lawyer admitting guilt **cannot** be used as evidence, as it breaches attorney-client confidentiality.

4- **Evidentiary Weight of Official Reports:**

According to **Article 218 of the Code of Criminal Procedure**, some official reports have **probative value unless falsified**, such as **customs reports** or those by **commercial inspectors**, which are regulated by special laws

Conclusion

Nanotechnology is a **double-edged sword**—it offers immense benefits to society and the world at large, especially in **solving complex issues**. At the same time, it poses serious risks and has the potential to enable crimes on a global scale.

Among its most notable contributions is in the field of **criminal evidence**, where it has revolutionized the **detection and proof of crimes**, particularly in areas that were previously difficult or impossible to investigate—such as **environmental crimes**. Thus, nanotechnology holds a pivotal place in modern criminal justice, demanding careful regulation and ethical oversight.

Keyword Legal issues, financial derivatives, Sharia standards of (AAOIFI).

Abstract

This article addresses the issue of Sharia-related problems in conventional financial derivatives and presents their alternatives according to the Sharia standards of the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI). It is one of the pressing issues in the Islamic finance industry due to the increasing need for legitimate hedging instruments that maintain a balance between economic efficiency and Sharia compliance.

The article begins by presenting the conceptual framework of conventional financial derivatives, discussing their concept and characteristics, objectives, and types. It then reviews the most prominent Sharia problems surrounding these instruments, before moving on to present their Sharia-compliant alternatives, concluding with a comparison between them and these alternatives in terms of contractual structure, economic efficiency, and applicability.

The study concluded that these instruments, in their conventional form, are not permissible under Sharia, and according to AAOIFI standards, they can only be used within alternative formulations that adhere to Sharia contracts such as Salam, Istisna, Murabaha, and others. It also pointed to important recommendations, most notably the necessity of developing Sharia-compliant markets that support these instruments, enhancing human capacities, and strengthening institutional infrastructure.

INTRODUCTION:

The subject of financial derivatives constitutes one of the central issues in modern economics and finance due to their active role in risk management and market volatility. They are a core component of contemporary financial transactions. However, in their conventional form, these derivatives raise a fundamental Sharia problem, making it necessary to reconsider them from the perspective of Islamic law.

The importance of this research lies in addressing one of the jurisprudential challenges in Islamic finance, as Islamic financial institutions seek to find hedging instruments that comply with Sharia. Hence, the significance of providing Sharia-compliant alternatives to conventional derivatives arises, enabling these institutions to achieve their financial objectives within a legitimate framework. This is precisely what the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI) has sought to achieve by issuing Sharia standards regulating such transactions.

Accordingly, this study falls within the scope of analytical comparative Sharia studies, aiming to answer the central question: What are the Sharia problems in conventional financial derivatives, and what are the available alternatives according to AAOIFI standards? It answers this through the following subsidiary questions:

1. What are conventional financial derivatives, what are their types, and what are their objectives and purposes?
2. What Sharia violations are involved in these instruments, and what is the position of AAOIFI as a Sharia supervisory body?
3. What Islamic financial instruments can replace these derivatives?
4. To what extent are these alternatives effective in financial risk management?

To address these questions, the study employs the descriptive method to clarify the nature of conventional financial derivatives in terms of concept, types, characteristics, and objectives; the analytical method to examine conventional derivatives and identify the Sharia objections they entail; the inductive method to extract rulings from the standards issued by AAOIFI and to trace their Sharia-compliant alternatives in line with the objectives of Islamic law; and finally, the comparative method to contrast the effectiveness of conventional derivatives and Sharia-based alternatives in terms of contractual structure, economic efficiency, and other aspects.

FIRST: THE CONCEPTUAL FRAMEWORK OF CONVENTIONAL FINANCIAL DERIVATIVES

Understanding the conceptual framework of conventional financial derivatives is a scientific necessity for comprehending the nature of the jurisprudential and economic debate regarding their legitimacy, the possibility of adapting them in accordance with Sharia, or innovating suitable alternatives. Given their importance in financial risk management, hedging, and dealing with market fluctuations, these instruments have become the subject of wide-ranging jurisprudential discussions.

This section addresses the fundamental concepts of conventional derivatives, their objectives, characteristics, and types, in preparation for examining them from the Sharia perspective in the subsequent sections.

1. The Concept of Conventional Financial Derivatives

Financial derivatives are financial instruments derived from other assets, called the underlying asset (such as stocks, bonds, commodities, foreign currencies, indices, and others). They can be bought, sold, and traded in a manner similar to stocks and other financial instruments (Kandouz, 2022, p. 5).

They have also been defined as financial instruments linked to a specific instrument, index, or commodity, through which financial risks can be bought or sold in financial markets. The value of the derivative instrument depends on the price of the underlying asset or indices under contract. Unlike debt instruments, there is no upfront payment to be reimbursed and no return due on investment. Derivatives are used for several purposes, including risk management, hedging against risks, arbitrage between markets, and speculation (Radwan, 2005, p. 61).

Thus, derivatives are not genuine sales contracts requiring the transfer of ownership of the underlying asset or cash flows. Rather, they are contractual arrangements aimed at generating profits from changes in asset prices their essence being a wager between the two parties on mere price movements.

2. Objectives of Derivatives in Financial Markets

Deriving from the aforementioned concepts of financial derivatives, the main objectives of trading these instruments can be summarized as follows (Kandouz, 2022, pp. 14-15; Hamad, 2001, p. 34; Hindi, 2003, pp. 12-24; Shafia & Dhehiba , n.d, pp. 383-384; Radwan, 2005, p. 238):

- **Hedging:** Used to hedge against the risks of expected changes in asset prices by reducing uncertainty and minimizing risk exposure as much as possible, even if it requires sacrificing part of the expected returns.
- **Price Forecasting:** Serving as a tool adopted by companies in their financial planning, derivatives provide market participants with information on asset prices in the present market for a specified delivery date.
- **Speculation:** Offering opportunities to generate profits from price fluctuations without the need to own the underlying asset. Derivatives are also used to obtain additional financial leverage.
- **Risk Management:** Facilitating the transfer of risks from one party to another more capable of bearing them, without the need for prior ownership of the underlying asset.

3. Characteristics of Conventional Derivatives (Hindi, 2003, pp. 12-24; Shafia & Dhehiba , n.d, pp. 383-384):

- **Dependence on an Underlying Asset:** Their value is not determined independently but depends on the underlying asset to which they are linked.
- **Leverage:** They enable investors to control large amounts and achieve significant gains with limited capital.
- **Tradability:** They can be quickly bought and sold in secondary markets due to their flexibility and high liquidity.
- **Non-symmetry:** They do not require the exchanged values to be equal.

- **Cash Settlement:** In most cases, settlement occurs in cash rather than through actual exchange of the commodity.

SECOND: TYPES OF CONVENTIONAL FINANCIAL DERIVATIVES

1. Forward Contracts (Forwards)

a. Definition:

A forward contract is "an agreement to buy or sell an asset at a specified future time for a specified price" (Hamad, 2001, p. 12).

It can also be defined as "an agreement between two parties to buy a certain asset (a real asset, currency, securities, etc.) at a future date for a price agreed upon at the time of contracting" (Kandouz, 2022, pp. 11-12).

In forward contracts, the contracting parties usually have prior dealings and knowledge of each other. Prices, quantities, and maturity dates are clearly defined through negotiation and direct communication. The contract is executed according to its conditions, and the actual delivery and receipt of the subject matter take place. These contracts are usually concluded over-the-counter (OTC), outside formal exchanges.

b. Characteristics (Hamad, 2001, pp. 12-18; Kandouz, 2022, p. 12):

- Simple derivatives that are usually not traded on exchanges.
- Their main purpose is to hedge against fluctuations in commodity and currency prices.
- The holder is obligated to buy or sell the underlying asset at a specified price and date.
- Entering into the contract has no upfront cost.
- They involve very high credit risk due to the absence of a guarantor, relying solely on the financial solvency of the two parties.
- Difficult to resell since they are privately negotiated for specific purposes between two parties, which results in high liquidity risk.

2. Futures Contracts (Futures)

a. Definition:

A futures contract is "an agreement between two parties to buy or sell a specific asset in the future at a specified price" (Hamad, 2001, p. 16).

Another definition is: "an agreement between two parties whereby one party commits to deliver a specified asset at a fixed price, with the time and place of delivery determined. The contracts are executed and settled by a third party—the clearinghouse" (Kandouz, 2022, p. 12).

Futures contracts involve both deferred price and deferred subject matter. They are standardized contracts organized by global exchanges, requiring a small margin paid to clearinghouses. Futures cover commodities, stocks, bonds, options, interest rates, and indices.

They are similar to forwards in that both are executed in the future. However, they differ in that futures occur between parties with no prior knowledge or dealings; they are traded on formal exchanges; they

are standardized with fixed, non-negotiable terms; and settlement often occurs by paying the difference rather than delivering the underlying asset.

b. Characteristics (Hamad, 2001, pp. 16-18; Kandouz, 2022, p. 12):

- Standardized and regulated contracts traded on exchanges.
- The holder is obligated to buy or sell the underlying asset at a specified price and date.
- Used for both hedging and speculation.
- No cost for entering into the contract.
- Highly liquid instruments.

3. Options Contracts (Options)

a. Definition:

An option is "the right to buy a particular stock at a specified price during a specific period of time. The value of the option derives from the underlying security, which the option grants the right to buy or sell. Hence, options are considered derivative securities. They take various forms, including call options, put options, and warrants" (Hamad, 2001, p. 40).

Another definition: "A contract under which one party (the seller) grants the other party (the buyer) the right (but not the obligation) to purchase a specific asset (which may be a real commodity, currency, security, etc.) at an agreed-upon price, called the exercise price, within a specified period (the contract duration). In return, the buyer pays the seller a premium (option price) at the time of contract" (Kandouz, 2022, p. 10).

Types of Options (by different considerations):

- **By the issuing entity:**
  1. Options granted by companies to senior employees as incentives, giving them merely the right (not the actual ownership) to buy or sell shares.
  2. Options issued by companies to attract new investors, often at below-market prices.
  3. Options granted by central authorities (stock exchange authorities or brokers) on shares.
  4. Options granted by companies to shareholders.
- **By the underlying instrument:** 1) Foreign currencies, 2) Indices, 3) Combined index-currency-stock options.
- **By contract nature:** Covered or uncovered options.
- **By type of option:** 1) Call option, 2) Put option, 3) Combined call and put option.

b. Characteristics (Hamad, 2001, pp. 16–18, 105; Kandouz, 2022, pp. 10–11):

- Traded in over-the-counter (OTC) markets.
- Used for hedging or speculation.
- Grant the right (but not the obligation) to buy or sell the underlying asset at a specified price and date. They are rights, not ownership or utility.

- Entering an option requires a premium.
- Require smaller amounts of capital compared to direct trading in stocks.
- Allow investors to limit losses since the maximum loss is known in advance.
- Provide greater financial leverage.
- Offer a wide range of opportunities for investors.
- Compared to other financial instruments, options are among the most widely traded.

4. Swap Contracts (Swaps)

a. Definition:

A swap is "an agreement between two parties whereby each agrees to pay a series of cash flows to the other over a specified future period. The agreement includes the payment dates and the method of calculation of these cash flows" (Al-Rubaie, 2011, p. 363).

Another definition: "A derivative contract in which two parties exchange cash flows from two different financial instruments (e.g., two loans in different currencies with different interest rates)" (Kandouz, 2022, p. 13).

They are also defined as: "the exchange of payments between two parties for the purpose of transferring risk from one party to another, either for hedging or speculative purposes" (Radwan, 2005, p. 238).

The most common types are currency swaps and interest rate swaps.

b. Characteristics (Kandouz, 2022, p. 257):

- Bilateral agreements traded in OTC markets.
- Involve the exchange of cash flows such as interest rates or currencies.
- Used for hedging against price or interest rate fluctuations.
- Highly flexible: for example, a company issuing floating-rate bonds can convert them into fixed-rate bonds if it anticipates rate volatility.
- Customized to meet the needs of contracting parties.
- Low-cost instruments.

THIRD: SHARIA ISSUES OF CONVENTIONAL DERIVATIVES ACCORDING TO THE STANDARDS OF THE ACCOUNTING AND AUDITING ORGANIZATION FOR ISLAMIC FINANCIAL INSTITUTIONS (AAOIFI)

Despite the active role conventional financial derivatives play in risk management and in reducing losses in financial markets, they carry profound Sharia problems. Contemporary Sharia boards, foremost among them the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI), have confirmed that these instruments, in their current forms, involve several Sharia prohibitions, including the following:

1. Sharia Issues of Forward Contracts

AAOIFI, in Sharia Standard No. 20, which addresses the sale of commodities in organized markets, discussed derivatives and declared it impermissible to deal in them, whether by creating or trading them. The reasons given for the prohibition of forward contracts include ((AAOIFI), 2015, pp. 554–559):

- Both counter-values are deferred, resulting in two liabilities without settlement.
- The condition contradicts the essence of the contract.
- They involve the sale of what one does not own.

2. Sharia Issues of Futures Contracts

AAOIFI addressed the Sharia problems of futures in Sharia Standard No. 20 (as above), Standard No. 21 on securities (stocks and bonds), and Standard No. 45 on capital protection and investments. All of these explicitly prohibit futures contracts due to the following Sharia violations ((AAOIFI), 2015, pp. 559, 562, 572, 582, 583, 1128):

- They are binding promises that transform into a sales contract in the future without offer (ijab) and acceptance (qabul).
- They require deferred delivery of a specified asset, such as stocks.
- The seller often sells what he does not own.
- They are settled in cash between the contracting parties, which constitutes gambling (qimar) or a form of it, whether or not stipulated in the contract.
- Actual delivery of the underlying asset is not intended by the parties.
- They create obligations and debts without benefit, serving only as speculation and exposing one party inevitably to loss.

3. Sharia Issues of Options Contracts

AAOIFI, in Standards Nos. 20, 21, and 45, declared options contracts impermissible, as they contain the following Sharia prohibitions ((AAOIFI), 2015, pp. 559, 572, 583):

- The subject matter of the contract (the option right) is not permissible to be exchanged for consideration in Sharia, since it does not initially exist for the seller but is created merely by contract.
- The subject matter does not pertain to property but to an intangible right (the right to buy or sell).
- They involve gharar (excessive uncertainty).
- They often end with cash settlement between the parties, which is gambling (maysir).
- They involve selling what one does not own, since the option writer (call option seller) does not possess the shares or commodities he undertakes to sell.

4. Sharia Issues of Swap Contracts

Swap contracts also involve several Sharia violations identified by AAOIFI in Standards Nos. 20, 21, and 45, including ((AAOIFI), 2015, pp. 559, 572, 583):

- Involvement of interest (riba), or forms of 'inah, and deferral of both counter-values.

- Both payments are deferred, making it a debt-for-debt transaction (bay al-kali bi al-kali).
- They involve gharar due to ignorance of the amount of money at the time of contracting.
- They involve gambling (qimar), whereby one-party gains at the expense of the other without actual exchange, as the contract merely settles differences in return rates on stocks.

5. Sharia Issues Related to Trading in Derivatives

Trading in these instruments is accompanied by additional Sharia concerns, including:

a. Contradiction with the essence of the contract:

Most conditional contracts are fictitious, involving no actual transfer of ownership, whereas Sharia contracts are intended to achieve transfer of ownership.

b. Contradiction with the objective of Sharia in establishing justice:

The philosophy underlying these derivatives inevitably results in one party's profit being realized through the other's loss. This contradicts the Sharia objective of fairness. Examples include speculators monopolizing certain securities to manipulate markets, exploiting participants' needs through unfair pricing not based on supply and demand, or through unilateral control of decisions within issuing firms.

c. Unethical practices leading to fraud (ghubn):

This occurs when traders deceive others in the market by creating artificial activity in stagnant stocks through agreements to sell and repurchase the same shares at the same or slightly different prices on the same day to create the illusion of genuine price movements. This constitutes prohibited deception.

Each of these Sharia prohibitions whether riba in all its forms, gharar, maysir and gambling, the sale of what one does not own, contradiction with the essence of contracts (ownership), violation of Sharia objectives of contracts (justice), or their association with fraud (ghubn) is, on its own, sufficient to prohibit these instruments. How much more when they are combined? These issues have driven the search for Sharia-compliant alternatives that achieve the same objectives without contravening Sharia rules, which will be addressed in the following section.

FOURTH: SHARIA STANDARDS GOVERNING ALTERNATIVE HEDGING INSTRUMENTS TO CONVENTIONAL DERIVATIVES AND THEIR REGULATIONS ACCORDING TO AAOIFI

Given the prohibition of conventional financial derivatives in Islamic law due to their inclusion of Sharia violations such as riba, gharar, maysir (gambling), the sale of what one does not own, and others, there arose a need to devise parallel financial alternatives that achieve the objectives of hedging and risk management without violating Sharia rules. From this standpoint, AAOIFI exerted precise jurisprudential effort to propose such alternatives, embodied in the formulation of clear Sharia standards that reinforce the principles of sound Islamic finance. Among these standards are the following:

1. Sharia Standard No. 10 (Salam):

Its content is "Salam," whereby an institution sells goods through a Salam contract, receives payment in advance, then procures the goods required by purchasing them from the market upon maturity. It is permissible to obtain a promise to sell in order to reduce the risk between the selling price and the purchase price ((AAOIFI), 2015, p. 862).

The standard states that Salam is a hedging tool against commodity price fluctuations. Its purpose is to clarify the Sharia rules and requirements that Islamic financial institutions must observe in such transactions, covering the contract, its subject matter, subsequent actions upon delivery or default, as well as the issuance of Salam Sukuk ((AAOIFI), 2015, pp. 272–281).

2. Sharia Standard No. 11 (Istisna):

Its content is Istisna: an institution concludes a manufacturing sale contract (bay al-Istisna) with a condition of upfront payment although not obligatory—and simultaneously concludes a parallel Istisna contract with deferred or installment payments ((AAOIFI), 2015, p. 862).

The standard defines Istisna and parallel Istisna as hedging instruments against price fluctuations in manufacturing. It aims to clarify the rules and Sharia requirements governing such contracts, covering their conclusion, subject matter, performance, supervision, warranties, amendments, additional claims, and delivery of the manufactured goods ((AAOIFI), 2015, pp. 293–307).

3. Sharia Standard No. 8 (Murabaha):

Its content is Murabaha: whereby the institution sells to its client (the orderer to purchase) a commodity at a markup over cost or purchase price. This markup (Murabaha profit) is pre-determined in the promise, and the transaction is often deferred payment, distinguishing "banking Murabaha" from ordinary Murabaha ((AAOIFI), 2015, p. 182).

The standard specifies Murabaha as a hedging instrument, clarifying the Sharia principles and requirements, from the initial promise through the client's ownership of the asset, as well as procedures for Murabaha guarantees and debt management ((AAOIFI), 2015, pp. 199–217).

4. Sharia Standard No. 9 (Ijarah Muntahia bi-Tamlik – Lease Ending with Ownership):

This is a lease contract coupled with a promise to transfer ownership of the leased asset to the lessee at the end of the lease term or during it ((AAOIFI), 2015, p. 208).

The standard defines it as a hedging instrument and clarifies its Sharia requirements, from the initial leasing promise (if any), through operational leasing, and finally to ownership transfer in Ijarah Muntahia bi-Tamlik. It details the conditions, procedures, and obligations for institutions whether acting as lessors or lessees ((AAOIFI), 2015, pp. 184–208).

5. Sharia Standard No. 45 (Capital and Investment Protection):

This standard explains the main Sharia-compliant means of protecting capital and investments within Islamic financial institutions. It addresses what is permissible and impermissible, with detailed rules. It emphasizes legitimate methods of mitigating risks, such as diversifying investments across real assets (e.g., real estate, commodities) and financial assets (e.g., stocks, Sukuk), or combining assets denominated in different currencies.

It also allows combinations such as Murabaha and Musharaka, or Murabaha and bay' al-'urbun (earnest money sale), dividing capital into two parts: one placed in secure Murabaha contracts and the other in riskier Musharaka or 'urbun contracts, thereby preserving capital while allowing profit opportunities. Safeguards such as collateral, guarantees, and options (khiyar al-naqd) are also included ((AAOIFI), 2015, pp. 1119–1127).

6. Sharia Standard No. 49 (Promises and Promissory Agreements):

This standard clarifies the nature of promises (wa'd) and promissory agreements (muw'ada), their binding force, Sharia rulings, and contemporary applications in Islamic financial institutions. It differentiates permissible from impermissible uses of promises and promissory agreements ((AAOIFI), 2015, pp. 1184–1193).

7. Sharia Standard No. 1 (Trading in Currencies):

This standard regulates currency trading, clarifying its Sharia conditions and what is permissible or not. It addresses actual and constructive possession, the use of modern communication means in foreign exchange transactions, the rules of deferred exchange, and practical cases in Islamic financial institutions ((AAOIFI), 2015, pp. 51–60).

8. General Regulations for the Use of Hedging Instruments According to AAOIFI:

AAOIFI also permits the use of other legitimate tools and procedures, with investor consent, to protect capital from risks of all types, whether arising from asset destruction, depreciation, inflation, exchange rate volatility, or otherwise ((AAOIFI), 2015, p. 876). The application of these instruments is conditioned by several Sharia requirements, including ((AAOIFI), 2015, pp. 565–566):

- **Legitimate hedging intention:** The purpose must be protective, not speculative.
- **Existence of a real asset (or a liability described in the contract):** The instrument must be tied to a tangible asset or legitimate commercial transaction.
- **Non-tradability of promises or contracts for speculative purposes.**
- **Compliance with Islamic contract conditions:** Regarding ownership, possession, price, and subject matter. Islam differentiates between contracts on gold, silver, food, and currency requiring immediate exchange—and contracts on other goods, where some flexibility exists regarding deferment.

From the above, it is clear that AAOIFI has worked to formulate comprehensive Sharia-compliant alternatives to replace conventional derivatives. These alternatives achieve hedging and risk management objectives within strict jurisprudential rules, including Salam, binding promises, Istisna, Murabaha, and others. These alternatives do not only fulfill financial purposes but also contribute to financial stability and Sharia compliance. The challenge remains to further classify other possible alternatives such as Istijrar contracts, supply contracts, and Islamic options (32 types), and to develop and streamline their application in ways that align with the needs of modern markets.

FIFTH: A COMPARATIVE STUDY BETWEEN CONVENTIONAL DERIVATIVES AND ISLAMIC ALTERNATIVES

Despite the wide spread of conventional financial derivatives in global markets as instruments for hedging and speculation, their use in Islamic finance remains rejected due to their contradiction with the principles and rules of Sharia. Within a comparative framework, Islamic financial institutions have adopted Sharia-compliant alternative instruments structured in accordance with AAOIFI standards. To provide a complete picture and assess the efficiency of these alternatives, it is necessary to conduct a systematic comparison between them and conventional derivatives, drawing upon the preceding discussions. The focus of this comparison is on the key differences in terms of the contractual Sharia structure, economic efficiency, and practical applicability.

1. Comparison in Terms of the Sharia Structure of Contracts (Bouchra & Omar , 2022, pp. 187–188):

Standard	Conventional Derivatives	Islamic Alternatives
Legal Structure	Abstract financial contracts not involving actual ownership of the underlying asset.	Based on recognized Sharia contracts (Salam, Istisna', Murabaha, and others).
Subject Matter of the Contract	Often nonexistent or not owned at the time of contracting.	Requires the existence and ownership of the subject matter or the ability to deliver it.
Execution Mechanism	Based on the exchange of price differentials or promises without an underlying asset.	Actual execution involving the delivery of goods or currencies in accordance with the contract.
Jurisprudential Aspects	Involve *gharar* (excessive uncertainty), *riba* (usury), *maysir* (gambling), *qimar*, and the sale of what one does not own.	Compliant with the contractual regulations in Islamic jurisprudence.

Note: Most Western authors acknowledge that derivatives are essentially a form of betting and gambling; they have caused numerous financial crises for many companies. Among them: *Procter and Gamble*, which lost **1.2 million USD** in 1994 due to speculation on interest rate movements; *Air Products and Chemicals*, which lost **60 million USD** as a result of dealing in derivatives; *Paine Webber*, which incurred losses of **268 million USD** within just four months of 1994 due to supporting one of its commercial funds in derivatives trading; and many others. In addition, there was the well-known crisis of *Berlin Bank* and the Great Recession of 2008 (El-Baz, 2003, pp. 38–39).

Islamic alternatives surpass conventional derivatives in terms of ethical safety and Sharia compliance; however, they require further technical and institutional development to enhance their efficiency.

2. Comparison in Terms of Economic Efficiency (Bouchra & Omar , 2022, p. 198; Supervision, 1996, p. 158):

Standard	Conventional Derivatives	Islamic Alternatives
Prevalence	Widely spread globally	Still limited in scope and sometimes conflict with domestic laws of certain countries
Liquidity	High, with immediate tradability	Lower, due to their linkage with actual assets
Speed of Execution	Rapid electronic execution	Require time to review contract compliance with Sharia
Hedging Efficiency	Ineffective	Effective but require precise structuring and strictness to ensure efficiency
Operational and Regulatory Risks	Pose significant operational and regulatory risks to banks	Do not pose significant risks

3. Comparison in Terms of Practical Use and Application (Bouchra & Omar , 2022, p. 186; Toumi, 2024, p. 493; El-Jouzi & Wahdou , 2016, pp. 81–83):

Standard	Conventional Derivatives	Islamic Alternatives
Applicability in Conventional Markets	High	Require Islamic institutional infrastructure
Ease of Promotion to Investors	Easy, globally understood	Require education and explanation of the product
Legislative and Regulatory Support	Recognized in capitalist systems	Require support from Sharia and regulatory authorities
Real Examples	Chicago Board of Trade, NYMEX, Euronext, Osaka Exchange, Singapore Exchange (SGX)	Central Bank of Bahrain, Al Baraka Islamic Bank (Bahrain), Al Baraka Bank Algeria, Bank Nizwa (Oman), Al Baraka Banking Group, Al Salam Bank Algeria, ...

It is evident from this comparison that conventional financial derivatives enjoy operational efficiency and wide global prevalence; however, they contravene the recognized Sharia regulations within the Islamic system. In contrast, Islamic alternatives provide a legitimate solution that balances the achievement of economic objectives with adherence to jurisprudential rulings, even though they still face practical and structural challenges. With continued support from Sharia boards and institutional development, the applicability of these alternatives is expected to expand globally.

CONCLUSION:

The study addressed the jurisprudential problems of conventional financial derivatives and their Sharia-compliant alternatives through an analytical comparative jurisprudential study between conventional derivatives as practiced in global markets and the Sharia-based alternatives approved by Sharia boards, particularly AAOIFI.

The research began by identifying the basic concepts of conventional financial derivatives, their characteristics, objectives, and types. It then moved on to discuss the Sharia problems inherent in these instruments, such as gharar (excessive uncertainty), riba (usury), maysir (gambling), and the sale of what one does not own. The position of AAOIFI regarding these instruments was reviewed, highlighting the main standards that addressed hedging and risk management, such as Salam, Istisna, Murabaha, Mudaraba, among others. Finally, a comparative study was presented between the two systems in terms of Sharia compliance, economic efficiency, and practical application.

The study arrived at the following findings:

1. Conventional derivatives contain fundamental Sharia violations, most notably excessive gharar, riba, maysir, and the sale of what is not owned, which renders them impermissible in Islamic jurisprudence in their current form.
2. AAOIFI, in its standards, confirmed the prohibition of using conventional derivatives for hedging and established legitimate and effective alternatives.

3. Sharia alternatives rely on contracts recognized in Islamic jurisprudence, such as Salam, Istisna, and Murabaha, among others, with the condition of genuine hedging intent rather than speculation.
4. Islamic alternatives excel in terms of Sharia compliance and the protection of wealth from prohibitions, but they still face practical challenges such as weak liquidity and complex institutional structures.
5. There is an urgent need for more innovation in Sharia-compliant structures to make hedging instruments more effective and suitable for Islamic financial institutions.

Main Recommendations:

1. The necessity of enhancing Sharia and technical awareness among professionals in the Islamic finance sector regarding legitimate hedging instruments and training them on their implementation.
2. Calling on regulatory and supervisory bodies to support Islamic financial markets that organize the trading of Sharia-compliant derivatives within a strict Sharia framework.
3. Guiding Islamic financial institutions toward using legitimate alternatives to protect themselves from risks and to achieve competitiveness within the global financial system.

Algeria

Issue web link	https://imcra-az.org/archive/385-science-education-and-innovations-in-the-context-of-modern-problems-issue-11-vol-8-2025.html
Keyword	Interactive Criticism, Digital Literature, Interactive Texts, Literary Genres, Multimedia, Interactive Reader.

Abstract

The literary and critical landscape has undergone a profound transformation driven by the technological revolution, which has propelled creative texts toward digital and interactive forms, Interactive criticism emerges as a direct response to this shift, aiming to analyze digital texts that rely on technology and multimedia platforms. This study examines the theoretical framework of interactive criticism by defining it as a composite concept that integrates digital interactivity with textual analysis, while highlighting its conceptual ambiguities and the terminological uncertainties surrounding it

The present study seeks to provide an in-depth examination of interactive criticism through a comprehensive approach that begins with defining the concept and tracing its epistemological roots, followed by classifying prominent forms of digital literature, such as interactive fiction and digital poetry, ultimately proposing a new taxonomy for interactive literary genres based on traditional literary categories, This approach reflects the necessity of rethinking conventional critical classifications in light of the distinctive nature of digital texts

The central challenge lies in developing critical tools capable of accommodating the dynamics of interactive texts, which surpass the linear framework of print-based literature, and in ensuring that literary criticism keeps pace with this transformation while maintaining analytical depth without descending into purely technical readings. Furthermore, this study addresses the question of the extent to which interactive criticism can offer new methodological insights aligned with the characteristics of digital literature, thereby expanding the horizons for analyzing digital texts within the Arab context.

Introduction:

Technological advancements have given rise to new forms of literary creativity, necessitating a reassessment of traditional critical tools to keep pace with digital transformations. In this context the concept of interactive criticism has emerged as a contemporary methodology focused on studying digital texts that rely on the interaction between the text and its audience The reader is no longer a passive recipient but an active participant in the construction of meaning.

The digital environment has fostered diverse forms of digital literature such as digital poetry and interactive narratives, which utilize multimedia platforms and enable the reader to engage dynamically with the text Classifying the forms of interactive literature according to traditional literary genres, alongside technological capabilities, requires a reevaluation of the boundaries and categorization of literary genres within the digital milieu.

This study aims to shed light on these aspects to achieve a deeper understanding of how digital literature reshapes the relationship between text and reader and to highlight the role of interactive criticism in analyzing this emerging phenomenon.

1. The Concept of Digital Criticism :

Digital criticism is a contemporary methodology dedicated to the study and analysis of literary texts created and structured through multiple technological media ,It arises from an awareness of the deep interrelation between literature and digital technologies, extending beyond the mere analysis of textual content to encompass the interactive relationships between textual elements and multimedia components such as images sound, motion and hypertextual links.

As an integrative approach, digital criticism is grounded in a methodological awareness that bridges literary knowledge and critical theory on the one hand, and technical and digital expertise on the other. It treats the digital text as an entity inseparable from the technological tools that produce it. Moreover, it is concerned with examining the ways in which readers interact with the text—through navigation, hyperlink transitions, and the exploration of its multidimensional layers.

This form of criticism emphasizes the creative dimensions introduced by digitality,including interactivity, polyvocality, and semantic interconnectivity, which render the reading experience flexible and continuously evolving Additionally, digital criticism demands a set of multifaceted skills: the ability to interpret literary meaning alongside the competence to analyze the technological architecture of the text, Such a dual capacity requires the critic to possess comprehensive familiarity with both contemporary literary theories and the software used in producing digital texts.

In this respect digital criticism represents a revolution in traditional critical paradigms, as it redefines the relationship between reader and text while affirming the decisive role of technology in reshaping the literary experience in unprecedented ways.1

The multiplicity of terms associated with digital texts reflects the technological developments that have fundamentally transformed the nature of texts, as well as their modes of production and consumption The term digital text represents the broadest concept, referring to any text produced, stored, or processed by a computer, regardless of its form or content Such texts are based on the binary system (1/0), which constitutes the foundation of digital data processing.

By contrast, the term electronic text emphasizes the medium through which the text is accessed, specifically referring to texts displayed via digital devices. This term is more specific than digital text, as it highlights the relationship between content and the electronic medium, distinguishing it from traditional print-based texts.

The interactive text represents the most advanced stage of digital textuality. Unlike static digital or electronic texts, it does not merely present information but allows readers to interact with the content through hyperlinks, images,

sounds, and videos. This form relies on the reader's active engagement in constructing meaning through direct interaction, thereby tailoring the reading experience to user preferences and making it dynamic and evolving.

Such terminological diversity reflects the richness of textual forms made possible by digital technologies It also underscores the increasingly central role of the reader within the communicative process who is no longer a passive consumer of information but an active participant in the production of meaning.2

Table Types of Digitaal Texts andd thier Characteristics :

Term	Definition	Medium	Reader's Role
Digital Text	Text produced via commputer,binary system (0/1).	computer	Passive reader's
Electronic Text	Text displayed through electronic devices;gains its quality fromm the medium.	Computer,smart, devices	Mostly Passive
Interactive Text	Text allowing interaction via multimedia (sound,image,video, hyperliinks).	Computer, internet, smart devices	Active,interactive reader

It can be observed from the table that there is a gradual development in the nature of digital texts, particularly in terms of interaction and the type of medium used. The digital text represents the most basic and simple form, as its primary role is to convey information through electronic devices without offering opportunities for interaction, In contrast, the electronic text relies on an electronic medium, making it more flexible in distribution and accessibility compared to printed texts.

Meanwhile, the interactive text is considered more advanced because it allows the reader to play an active role in the reading process through engagement with the content via multimedia channels ,This transition reflects the shift of the reader from being a mere consumer of information to a participant in meaning-making, thereby enhancing the reading experience and making it more engaging and interactive.

The table also highlights the importance of the digital medium in reshaping the relationship between the text and the reader The content has become richer and more integrated through the inclusion of audio images and video, which contributes to creating an enjoyable and immersive reading environment.

2.Digital culture represents a state of awareness :

that has emerged in the modern era The world has witnessed tremendous technological advancements, leading to the rise of what is known as "digital culture," which has become an integral part of our daily lives ,This culture is not limited to the use of modern devices and technologies; it also encompasses a set of behaviors, habits, and knowledge that shape the awareness of individuals and societies in interacting with the digital world

Digital culture is defined as a set of behavioral patterns, habits, norms, and knowledge applied when using advanced devices in the virtual environment, along with the skills and capacities required to participate effectively in this digital world This definition highlights the importance of conscious engagement with modern technologies, requiring a deep understanding of how these tools function and their impact on our lives With the widespread

diffusion of technology, it has become essential to develop digital awareness among individuals, particularly in developing societies. In the context of a digital divide among different social groups, challenges arise regarding social sustainability and the ability to keep pace with technological advancements Therefore, fostering digital culture is considered a means to ensure social sustainability and bridge the digital gap.

Educational and cultural institutions play a pivotal role in promoting digital culture. Public libraries, for example, serve as ideal environments for teaching and training individuals in digital skills by providing robust informational and cultural resources that support learning and interaction with modern technologies.

Thus, digital culture represents a form of awareness that requires collaborative efforts across various sectors to enhance and disseminate it Through education and awareness initiatives, individuals can acquire the necessary skills and knowledge to engage effectively with the digital world, contributing to the development of more informed and sustainable communities in the digital era.3

3.Interactive Literature: A Digital Revolution in the World of Narratives :

In the digital era literature is no longer confined to the pages of a book or restricted to a linear narrative style It has transformed into an interactive experience that grants the reader an active role in constructing and shaping the text This transformation has led to the emergence of what is known as interactive literature, a form of digital writing that transcends the boundaries of traditional texts It allows readers to participate actively, whether by modifying the text, choosing different narrative paths, or even contributing new content This form of literature represents an extension of the digital revolution, redefining the relationship between the text and the reader and creating a new form of creativity that merges literature with technology. Notable scholars, such as Fatima Al-Breiki, have studied this literary form identifying seven core characteristics that distinguish interactive literature from traditional literary forms The following presents these characteristics and their significance for the reading experience and literary creativity.

1. Open-ended Texts:

Interactive literature enjoys unprecedented openness, with no fixed beginning or ending Readers can navigate the text freely, which may conclude at a certain point on the network or extend indefinitely This reflects the nature of the digital era, which breaks temporal and spatial boundaries As a result, interactive texts resemble a live experience, where the reader feels not merely as a recipient but as a creator of events and narrative paths.

2. Reader Empowerment and Control:

In traditional literature, the reader remains a passive consumer of content without direct influence over it In interactive literature, the reader assumes an active role, feeling ownership of the text and control over its direction This feature enhances the sense of engagement and immersion, making the literary experience more vibrant and personalized, as each reader may encounter a unique journey based on their choices.

3. Absence of a Single Author and Collective Participation:

A defining characteristic of interactive literature is that it does not recognize a sole author The text becomes a collaborative space where users can modify, contribute, and participate in its creation. This phenomenon reflects the collaborative spirit of the digital era but raises questions regarding “literary ownership” and the limits of individual creativity, as the text is no longer the product of a single author but an evolving experience shaped by multiple readers and writers.

4. Multiple Temporal and Spatial Dimensions:

Unlike traditional literature, which adheres to a specific chronological and spatial sequence, interactive literature allows movement across different times and spaces within the text The reader is not confined to a single path but can jump between events and explore the textual world according to personal choices This creates a reading experience akin to navigating a digital game, where the text becomes an open space offering infinite possibilities for exploration and interaction.

5. Absence of Fixed Data and Multiple Paths:

Interactive literature contains no fixed data or single reading path; the text changes according to the reader's decisions, evolving like a living entity However, this also presents challenges for critical analysis, as there is no "final" text to study, only an infinite set of possibilities that varies from reader to reader.

6. Direct Interaction through Dialogue:

Digital tools allow readers to interact directly with the text, whether by selecting narrative paths or engaging with textual characters This transforms reading into an active experience rather than a passive one, making readers feel as though they communicate with the text This characteristic brings interactive literature closer to digital games and virtual reality, blurring the boundaries between reader, writer, and textual characters.

7. Multiple Levels of Interaction:

Interaction in interactive literature is not limited to simple choices, such as selecting an ending; it can also involve complex engagement, such as modifying and reshaping the entire text These varying levels of interaction reflect the advanced nature of this literary form, ranging from minimal intervention to complete text reconstruction, making creative boundaries unprecedentedly open.4

From the foregoing, it is evident that interactive literature is not merely a minor development in narrative techniques, but a genuine revolution that redefines the relationship between the text and the reader, It liberates the reader from being a passive recipient and grants them a creative role, allowing active participation in shaping the text This renders the reading experience dynamic and constantly evolving.

However, interactive literature also raises several critical questions: Does the openness of texts lead to a loss of aesthetic value? Can interactive texts be considered complete literary works, or do they remain open-ended experiences? What is the role of the critic in analyzing texts that continually change according to the reader's choices?

Regardless of these questions, there is no doubt that interactive literature reflects the spirit of the digital era and offers new possibilities for creativity and literary experimentation, making it one of the most innovative and exciting forms of literature in the 21st century.

4.Types of Digital Literature According to Mr. Najm:

1. Theoretical Digital Criticism: This type of digital criticism focuses on the theoretical aspects of digital culture, such as the developments of new technological innovations and their implications ;It examines how these technological advancements influence literary creation, as reflected in areas like the relationship between images and digital literature.

2. Applied Digital Criticism: This form of criticism specializes in specific digital fields, such as digital creativity or other areas, providing practical analysis and evaluation within those domains.

3. Interactive and Future-Oriented Digital Criticism: This type involves the critic's engagement with data produced by digital technologies and explores strategies for future developments across all sources of digital culture.5

The three types of digital criticism mentioned above represent a methodological complement in the study of digital literature and the analysis of its elements Theoretical digital criticism constitutes the foundational aspect, establishing the conceptual framework for studying digital literature by focusing on technological data and its impact on the creative process Applied digital criticism is manifested through the practical analysis of digital works, allowing for the examination of how modern technologies are utilized within digital texts and highlighting their creative aspects.

Interactive and future-oriented digital criticism is the most advanced, as it reflects the critic's engagement with emerging digital developments and anticipates the future of digital literature This makes it a tool capable of keeping pace with rapid transformations in the digital realm This classification illustrates the responsiveness of literary criticism to technological advancements and provides a comprehensive methodology for studying digital literature from all perspectives.

5.Classification of Interactive Literature According to Literary Genres :

Introduction:

Literature has undergone fundamental transformations with the advancement of digital technology ,These developments have produced new forms of texts that rely on multimedia and direct interaction with the reader Interactive literature is one of the most prominent manifestations of this evolution, as it breaks the traditional boundaries between the author and the reader and reshapes their relationship within a framework based on interaction and participation.

From this perspective, interactive literature can be classified according to the literary genre to which the texts belong, encompassing digital poetry, interactive novels, and digital stories. Each genre is characterized by artistic features that reflect the integration of written texts with audio-visual elements, offering readers a multi-dimensional reading experience.

This classification not only reflects differences in form and content but also highlights a transformation in the role of the reader, from a passive recipient to an active participant in meaning-making. Consequently, interactive literature emerges as a new creative space where literary arts and digital technology converge to produce a unique aesthetic experience.

5.1 Digital Poetry:

Concept of Digitalization: Saeed Yaqtin defines digitalization as "the process of transferring any type of document from an analog format to a digital format, whereby the text, still or moving images, and sound are encoded into numbers This transformation enables the document, regardless of its type to be stored and utilized through information devices."6

From Saeed Yaqtin's definition, it is evident that digitalization represents a transformation from the traditional format to the digital format, facilitating the storage and processing of documents through information devices This concept reflects the role of technology in reshaping texts, enabling new forms of literary creativity and enhancing the reader's interaction with the content.

Critic Fatima Al-Breiki defines digital poetry as a form of poetic writing that manifests exclusively through electronic media, relying on technologies provided by modern innovations, and varying in its style of presentation and method of delivery to the reader-user."7

From Fatima Al-Breiki's definition, it is clear that digital poetry is closely linked to the electronic medium, relying on modern technology to present its content The definition highlights the role of multimedia in enriching interactivity and diversity, as this type of poetry cannot be separated from the digital environment that gives it its artistic identity.

Moving to another perspective on digital poetry, it can be defined as: poetry that is delivered through electronic media made available by technological advancements" 8.

From this perspective, it is evident that this definition emphasizes the interactive relationship between digital text and technology, highlighting that digital poetry results from the fusion of literature and technology This opens new horizons for poetic creativity and reflects a transformation in the way literary texts are presented Literary texts are no longer limited to words alone; they now rely on multimedia elements such as sound, images, and motion, enhancing the reading experience and making the reader an active participant in meaning-making.

The features of interactive poetry are identified as follows: "It presents an open-ended text (Texte Open Ende) or a limitless text, giving the reader the opportunity to feel ownership over all that is presented on the network. It does not recognize a single creator of the text, which makes the readers and users of the interactive text active participants in it The endings are not uniform due to the multiple paths and choices available to the reader."9

5.2 Interactive Theatre:

Literature and art have undergone radical transformations throughout the ages, reflecting the cultural changes experienced by societies Among the most prominent of these transformations is the emergence of new forms of creative writing, including interactive theatre, which represents a modern model that redefines the relationship between the author and the audience. This type of theatre embodies a new philosophy based on involving the audience in the creative work, opening new horizons for the artistic experience

Interactive theatre is one of the manifestations of interactive literature. Fatima Al-Breiki defines it as a new form that goes beyond the traditional understanding of literary creativity, which historically focused solely on the author's role In interactive theatre, the artistic work is not limited to the text and performance; the audience becomes an active participant in shaping the theatrical presentation. This form of theatre removes the barriers between performers and the audience, allowing the latter to engage in the theatrical event and influence the course of the performance.

The significance of interactive theatre lies in its ability to break the "fourth wall" that traditionally separated the stage from the audience Instead of being passive spectators, viewers become essential components of the theatrical experience ,This interaction creates a unique experience that reflects the impact of modern technology and the evolution of communication tools in transforming artistic modes of engagement (10).

It can be said that interactive theatre represents a revolution in the concept of theatrical art, reflecting contemporary trends toward involving the audience in the creative process By transcending the traditional relationship between the author and the audience, it enhances the value of participation and grants the audience a genuine role in shaping the artistic message This theatrical form opens new horizons for creativity, yet it also raises questions regarding the limits of authorship and the role of the artist in the creative work, Interactive theatre remains a true embodiment of the digital era, where interaction becomes a fundamental element of the artistic experience

5.3 Interactive Novels: Literary Renewal in the Technological Space

Literature has undergone numerous transformations throughout history, keeping pace with the social and cultural changes experienced by humanity With the dawn of digital technology, a new literary form emerged that reflects the spirit of the digital age: the interactive novel This innovative genre aligns with technological media to redefine the traditional relationship between the author, the text, and the reader, relying on a non-linear structure based on direct interaction.

Concept of the Interactive Novel:

The interactive novel is defined as a literary text that relies on digital media, allowing the reader to participate in the progression of events and determine its narrative paths, This genre adapts to contemporary technology and is enriched by its ideas and visions, supporting the notion that interactive literature embodies the inevitable advances of technological development. In this sense, the interactive novel becomes an open text that breaks the conventional linear reading pattern and grants the reader authority in shaping the text and its narrative trajectories.

Interactive novels rely on multiple narrative paths, where readers encounter different choices that lead to varied outcomes These options are presented through digital interfaces, such as branching texts, hyperlinks, or multimedia elements like sound, images, and video This interactive structure provides readers with an individualized reading experience that changes according to their choices, making each reading encounter unique.11

Conclusion:

In conclusion, it becomes evident that literature in the digital age represents a qualitative shift in the contemporary cultural and literary landscape, reflecting the convergence of artistic creativity with the technological and social transformations imposed by the digital revolution across various spheres of life. This literary evolution has given rise to what may be termed "interactive criticism" a novel analytical tool that aligns with the nature of digital texts, which are founded upon participation and direct engagement with the reader Interactive criticism focuses on examining the relationship between the text and its audience, taking into account

the multimedia elements employed in literary works, such as hyperlinks sound and images, while analyzing how meaning is reshaped through the choices available to the recipient.

The most prominent forms of interactive literature manifest in several creative models, including interactive poetry, which opens new aesthetic horizons by blending words with sensory effects; interactive theater, which breaks traditional boundaries between performance and audience by transforming spectators into active participants in the unfolding of events; and interactive fiction, which grants readers a central role in determining narrative paths and potential endings. These diverse literary forms demonstrate that interactive literature is not merely a technological development, but rather a reflection of a deeper transformation in the relationship among author text and audience, redefining the concept of creativity and critical engagement within a multidimensional digital context.

Consequently interactive literature does not merely provide a novel experience for the audience; it also opens the door to a reconsideration of traditional critical methodologies, offering fertile ground for studying the interactions between text and audience in innovative ways ,This contributes to the expansion of both creative and critical horizons in digital-era literature and underscores the necessity of developing new analytical tools suited to this rapidly evolving reality, ensuring that literary studies remain responsive to contemporary technological and cultural challenges.

Conflict of Interest

The author declares no conflict of interest. All observations, interpretations, and recommendations presented in this article are based on professional experience and research conducted independently.

Keywords Academic Achievement ; Physical Ability ; Middle School Education.

Abstract
This study aims to analyze the correlational relationship between academic achievement and certain physical abilities among middle school students. We employed the descriptive method on a sample of 86 students studying in several middle schools in the Wilaya of Bordj Bou Arréridj, Algeria. The sample was intentionally selected. Three physical tests were used: the 30-meter sprint test to measure speed, the standing broad jump to measure explosive strength, and the five-step jump test (pentathlon) to measure speed-strength. Statistical data processing was conducted using arithmetic mean, standard deviation, simple and multiple linear regression, and ANOVA, via the SPSS statistical software. The results revealed a strong correlation between certain indicators of physical ability and academic achievement, which was measured through the annual average of the study sample.

Introduction

Contemporary educational organizations propose that children's experiences in sport and physical education (PE) contribute to the mental acuity, skills, and strategies that are important for navigating challenges faced across the life span (America SoHaPE, 2014, p1). The perceived importance of PE and its contribution to children's academic success has varied considerably over the history of the modern educational system (Tomporowski Pd & okumura MS, 2011, p53).Over the past decadethe focus was on academic achievement and test scores, school

administrators are constantly evaluating curricula to maximize learning opportunities. In order to decide whether to add, maintain, or cut physical activity and physical education (PE) programs in elementary and middle schools(Howie Ek & Pate RR, 2012, p161).Physical activity (PA) proponents have long argued for the necessity of school-affiliated pa, suggesting that the time spent in pa would benefit health and might contribute to academic performance(Trudeau. FO & Shephard. RJ, 2008, p2).Health and educational professionals confirm that physically active students perform better in the classroom, so incorporating physical activity during every school day is essential for numerous reasons. Physical activity has physical and mental health benefits. As physical activity is linked to lowered risks of obesity, increased cardiovascular fitness, improved health, and academic achievement. (Karen rodenroth, 2010, p17). There are many debates on the effect of physical activity on academic performance among children and adolescents, ratey & hagerman (2008) and hansen (2017) also point out the impacts of physical fitness training on non-cognitive factors, such as controlling negative mood, the improvement of concentration, and the triggering of motivation for learning new things, due to the increased level of neurotransmitters in the brain.(Yilan xu, 2021, p02), many neuroscientists believe that our minds and bodies are connected "the better your fitness level, the better your brain works" (Ratey &Hagerman, 2008, p 247).

A large number of researchers from different countries have reported that there is a positive association between the overall physical fitness level and the academic 3 achievement of children and adolescents, one of the similar previous studies that addressed this topic is:

Blom, Lindsey c & Kolbo, Jérome (2011) a study of associations between health-related physical fitness, academic achievement and selected academic behaviors of elementary and middle school students in the state of mississippi. The purpose of this study was to explore the relationships among these variables by using objective measures of fitness, standardized language arts and math test scores, attendance records, discipline actions, and socio-demographic information from a sample of 2,992 mississippi (usa) public school children in grades 3-8. The sample consisted of students who were mostly male (52.4%), white (52.3%), in grades 3-5 (64.2%), within a healthy weight range (54.1%), and qualified for free/reduced price lunch (63.7%). The results indicated a statistically significant positive correlation between fitness and standardized test scores in language arts and math and a statistically significant negative relationship with school absences. The relationships remained significant while controlling for gender, race, and socioeconomic status. (Blom C & Kolbo J, 2011 p 13)

Francisco Javier Fonseca Del Pozo & Francisco Jesus Llorente Cantarero (2017) a study of physical fitness as an indicator of health status and its relationship to academic performance during the prepubertal period. The aim is to examine the relationship between physical fitness (pf), pa, obesity and academic performance (ap) in primary school children, via cross-sectional studies including 91 primary school students, aged 9 to 12 years, from the province of cordoba. Data was collected from april to june 2014. We measured pf using part of the eurofit fitness testing battery. The level of pa was measured as low or high pf and the level of obesity was measured using body mass index, waist circumference, percentage of fat mass, lean body mass, percentage of lean mass and basal metabolism. Ap by scores on the second quarter was based on the total average of scores of basic subjects and other subjects, including physical education. Cognitive performance was assessed by the spanish overall and factorial intelligence test,the results of ap were positively related to levels of pf. Students who achieve better pf score better in maths, ($p = 0.019$), natural sciences ($p = 0.024$), religion ($p = 0.018$) and physical education ($p < 0.001$). A direct association between maximal aerobic capacity with mathematics ($r = 0.325$, $p = 0.02$), ap ($r = 0.349$, $p = 0.001$) and cognitive performance (cp) ($r = 0.312$, $p = 0.003$) was observed. There was also a direct association of better jump tests with higher ap ($r = 0.328$, $p = 0.002$). (Francisco, JP &Francisco, JC , 2017, p 197)

Based on these established theoretical findings, the problem of the current study revolves around examining the relationship between academic achievement and some physical ability indicators among middle school students, The main research question is:

- Is there a statistically significant correlation between academic achievement and some physical ability indicators among middle school students?

This general question is further divided into the following sub-questions:

-Is there a statistically significant correlation between academic achievement and speed index among middle school students?

-Is there a statistically significant correlation between academic achievement and explosive Strength index among middle school students?

-Is there a statistically significant correlation between academic achievement and speed- Strength index among middle school students?

General Hypothesis:

-There is a statistically significant correlation between academic achievement and some physical ability indicators among middle school students.

This general hypothesis is further broken down into the following sub-hypotheses:

-There is a statistically significant correlation between academic achievement and speed index among middle school students.

- There is a statistically significant correlation between academic achievement and explosive Strengthindex among middle school students.

-There is a statistically significant correlation between academic achievement and speed- Strengthindex among middle school students.

This study aims to identify the correlation between academic achievement and some physical ability indicators (speed, explosiveStrength, speed- Strength) among middle school students, and the impact of physical ability on academic performance, which can be measured by the annual school average among middle school students.

The significance of this study lies in its attempt to uncover the nature of the relationship between physical ability levels and academic achievement, and to clarify the impact of physical activity and sports on academic performance, which can be measured by the annual school average among middle school students. Focusing on this age group, which represents adolescence (12–15 years), is essential, as it is a critical and sensitive stage marked by significant physical changes. The findings of this research could be beneficial in promoting physical fitness among adolescents in Algeria, maintaining their physical and mental health, and fostering their cognitive and academic development. The study may also offer suggestions for educational curriculum reforms to develop effective strategies for enhancing academic learning within a healthy educational environment.

Definition of key terms in the search :

Physical ability : A physiological state of well-being that reduces the risk of hypokinetic disease; a basis for participation in sports; and good health which enables one to complete the tasks of daily living. Components include cardio-respiratory endurance, muscle strength endurance, speed, flexibility, and body composition.

Academic achievement : The extent to which a student, teacher or institution has achieved their educational goals, commonly measured by examinations or continuous assessment. (joseph E. donnelly &al, 2016, p1200)

Middle School Education: Also known as intermediate education, this constitutes a general educational phase positioned between primary and secondary education. Students' progress to it from the primary level and subsequently advance to secondary education. The study duration spans four (04) years, typically covering the age bracket of 12–15 years, a phase frequently termed early adolescence.

Methodological Approaches

We conducted a pilot study on a sample of eight (20) students to test the data collection tools and assess the sample's responsiveness to them.

- This study was conducted in sixteen (11) secondary schools within the Bordj Bou Arreridj Province.

- The study took place from 02 February 2025 to 21 April 2025.

-Methodology Used: We adopted the descriptive method as it aligns with the nature of the research.

-Population and Sample of the Study: The research population comprised all middle school students in the Bordj Bou Arreridj Province. We purposefully selected a sample of eighty (86) second-year middle school students, distributed across sixteen (11) secondary schools.

-Identification and Measurement of Variables: Independent Variables (some physical ability indicators (speed, explosiveStrength, speed-Strength), Dependent Variable (academic achievement) which is expressed as the annual average for the academic year.

Data Collection Tools: Three (03) validated physical tests were applied:
-The first test measured speed.
-The second test measured explosive Strength.
-The third test measured speed-Strength.

Physical Tests Administered: The 30-metre sprint test (from an approximate running start) to measure speed, standing broad jump test to measure explosive Strength, Five-step jump test (pentathlon) to measure speed-Strength.

The data collection tools were subjected to scientific validation.

- Statistical Tools: We conducted several statistical analyses using the SPSS 2020 software. The following relationships were selected: (Mean, Standard deviation, Multiple linear regression, Pearson correlation coefficient, Coefficient of determination, Adjusted coefficient of determination, and F-ANOVA).

Presentation, analysis of Results

The results were as follows:

Table (01): Regression Coefficients between the Independent Variables (speed, explosive Strength, speed-Strength) indicators and the Dependent Variable (academic achievement) among middle school students.

Variable	Unstandardized Coefficients		Standardized Coefficients	T-test	Sig	(R)	(R^2)	Adjusted (R^2)
	B	Standard Error	Beta					
Regression InterceptB_0	22,63	2,54		8,96	0,00	0,45	0,20	0,17

speed	0,62	0,19	-0,42	3,19	0.002			
explosive Strength	0,38	0,88	0,05	0,43	0,66			
Speed-Strength	-1,26	0,45	-0,28	-2,77	0,007			

Source: Prepared by the researchers based on the SPSS output, 2020.

First: Theoretical Conditions

Consistency or Logical Validity of the Regression Coefficient Values and Signs

It is observed here that the variables under study fall within the framework of identifying athletically gifted students in the field of sports training.

Referring to the multiple linear regression model obtained in the study, which illustrates the significant relationship between the independent variables (speed, explosive Strength, speed- Strength) index and the dependent variable (academic achievement) among middle school students, we derive the following equation:

$$Y = -0{,}02X_1 + 0{,}06X_2 + 3{,}20$$

From this model, we conclude the following:

- The constant part B_0 has a positive value and is not equal to zero (22,63).
- The slope of the regression line B_1has a positive value (0,62).
- The slope of the regression line B_2 has a positive value (0,38).
- The slope of the regression line B_3has a negative value (-1,26).

We note that there is no contradiction between the theoretical conditions of the phenomenon under study and the results of the regression model, which explains the effect relationship between the independent variables (speed, explosive Strength, speed-Strength) index and the dependent variable (academic achievement)among middle school students.

The Explanatory Power of the Model

The explanatory power of the regression model is judged by the adjusted coefficient of determination, found in Table (01), which demonstrates the significant relationship between the dependent variable (academic achievement)and the independent variables(speed, explosive Strength,speed-Strength) index in the study sample. The value of the adjusted coefficient of determination is estimated at (0.17), meaning that the selected study variables explain (17%) of the effect of the independent variables (speed, explosive Strength, speed-Strength) index on the dependent variable (academic achievement) for the study sample. In other words, (17%) of the variations in the dependent variable (academic achievement) are attributed to the independent variables (speed, explosive Strength, speed-Strength) index in the study sample, while (83%) are due to other factors.

These results reflect the validity of the selected study variables and their capacity to explain the results of the regression model. The statistical significance of this model is justified by the significance level, which is estimated at a probability value of (0.00). This is statistically significant and aligns with the study's hypotheses.

Second: Mathematical Conditions

Table (02): Analysis of Variance (ANOVA) for the Independent Variables (speed, explosive Strength, speed-Strength) indicators and the Dependent Variable (academic achievement) among middle school students.

Source	Sum of Squares	Degrees of Freedom	Mean Squares	F Value	Sig Value
Regression	92,70	3	30,90	6,83	0,000
Error	375,41	83	4,52		
Total	468,12	86			

Source: Prepared by researchers based on SPSS output, 2020.

The purpose of calculating the ANOVA table is to analyse the total sum of squares of the dependent variable (SST), the sum of squares due to regression (SSR), and the sum of squares for the error (SSE).

Additionally, the key indicator for the quality of the regression model is the coefficient of determination (R^2), calculated as follows:

$$R^2 = \frac{\text{Sum of Squares for Regression (SSR)}}{Total\ Sum\ of\ Squares\ (SST)} = \frac{92,70}{468,12} = 0,20$$

Explanatory Power of the Model

The square root of the coefficient of determination equals the correlation coefficient$\sqrt{R^2} = \text{r}$By substituting the values, we find $\text{r} = \sqrt{0,20} = 0,45$ These results align with the outcomes shown in Table (02) and indicate that (45%) of the total variance in the dependent variable is explained by the linear relationship in the regression model between the dependent variable (academic achievement) and the independent variables (speed, explosive Strength, speed- Strength) index in the study sample. This result justifies the adjusted coefficient of determination obtained in Table (02).

Overall Significance of the Model

From Table (02), it is clear that the calculated F-value is (6,83), and the P-value is (0,00), which is less than the significance level of (0,05). This means that at least one of the regression coefficients differs from zero and is statistically significant.

Partial Significance of the Model

In the previous step, we concluded that at least one of the regression coefficients differs from zero. To determine which of these coefficients is significant, we conduct a partial significance test for the model using the T-test.

From the results in Table (01), we find:

-The constant $\boldsymbol{B_0}$ (22,63) with a probability value of (0,00), which is less than (0,05), indicating that the constant in the regression model is significant.

-The slope of the regression line $\boldsymbol{B_1}$ for the speed index among the study sample is(0,62) with a probability value of (0,002), which is less than (0,05). Therefore, we conclude that the slope for speed in the regression model is significant.

-The slope of the regression line $\boldsymbol{B_2}$ for the explosive Strength index among the study sample is (0,38) with a probability value of (0,66), which is bigger than (0,05). Thus, we conclude that the slope for explosive Strength in the regression model is not significant.

- The slope of the regression line B_3 for the speed-Strength index among the study sample is (-1,26) with a probability value of (0,007), which is less than (0,05). Therefore, we conclude that the slope for speed-Strength in the regression model is significant.

Discussion

The obtained results indicate a significant relationship between the independent variables, physical ability indicators (speed, explosive Strength, speed-Strength), and the dependent variable, academic achievement, among middle school students. Changes in the independent variables,(speed, explosive Strength,speed-Strength) indicators, have a noticeable impact on the dependent variable, academic achievement, among the study sample. The statistical model shows that (17%) of the effects on the dependent variable, academic achievement, can be attributed to the independent variables, (speed, explosive Strength, speed- Strength) indicators, among the sample participants, while (83%) is due to other factors. Additionally, (39%) of the total variance in the residuals is explained by the linear correlation of the regression model between academic achievement (dependent variable) and (speed, explosive Strength, speed-Strength) indicators (independent variables) among the study sample. This result highlights the strong correlation between academic achievement and (speed, explosive Strength, speed-Strength) indicators, which equals (0,39) with a probability value (P-value) of (0,00), less than (0,05), making it statistically significant.

Therefore, the study hypothesis is confirmed, indicating a statistically significant correlation between academic achievement and some physical ability indicators (speed, explosive Strength, speed-Strength) among middle school students. This suggests that (speed, explosive Strength, speed-Strength) indicators have a positive effect on academic achievement, meaning that academic achievement is influenced by the levels of physical fitness (speed, explosive Strength, speed-Strength). In other words, as an individual's physical fitness increase, his academic level increased, and vice versa.The systematic reviewin joseph E. donnelly & al (2016) study found evidence suggesting an associations among PA, fitness, cognition, and academic achievement. Improvements in executive function are frequently associated with acute bouts of activity and fitness. Improvements in academic achievement are also found with acute activity. (joseph E & al, 2016, p1216),The study by D. N. Ardoy & al (2014), conducted on pubescent children in Murcia, Spain, confirmed that increasing the frequency and intensity of physical education sessions positively impacts academic achievement in mathematics and language.(D. N. Ardoy & al, 2014, p52).

Our current study's results align with those of Francisco Javier Fonseca & al (2017), which found a positive correlation between academic progress programs and physical fitness levels. It was established that students with better physical fitness levels achieved higher scores in mathematics, natural sciences, religion, and physical education. (Francisco. J & al, 2017, p201),Our study's results also align with the findings of Blom, Lindsey C & al (2011) which indicated astatistically significant positive correlation between fitness and standardized test scores in Language Arts and Math and a statistically significant negative relationship with school absences. The relationships remained significant while controlling for gender, race, and socioeconomic status. Given that students who were more fit had higher test scoresand fewer absences. (Blom. C & al, 2011, p19), Our study also concurs with the findings of Redouane & Fateh (2021), which showed a strong correlation between academic performance and physical fitness components (speed, strength, endurance) among middle school students. The researchers asserted that students with higher capacities in speed, strength, and endurance tend to achieve better academically. (Redouane & Fateh, 2021, p349), According to Ronald W. Bass & al (2013), muscular strength and aerobic endurance are strongly correlated with academic achievement, though to a lesser extent than aerobic fitness stability. This emphasizes the importance of programs that promote physical fitness, such as physical education, due to their significant role in academic domains. (Ronald. W & al, 2013, p835), The study by Laura Redondo & Vicente Javier (2022) revealed a strong relationship between academic achievement and VO_2 max, diastolic blood pressure, and sleep disorders caused by breathing issues. The study indicated that high-achieving students had higher VO_2 max values, lower diastolic blood pressure, and reduced levels of sleep disorders due to respiratory problems. Conversely, the low-achieving group exhibited significantly higher levels of diastolic blood pressure and sleep disturbances, along with much lower VO_2 max scores.(laura & vicente, 2022, p04).

Youssef & Saïd (2015) confirmed that students enjoying good health and possessing essential physical fitness components are better equipped to handle the various challenges of daily and academic life. Health and fitness positively impact intelligence and mental capabilities, all contributing to strong academic achievement. (Youssef & Saïd, 2015, p193), Practicing sports has been associated with mental health, as increased self-esteem can be

observed in those who regularly engage in physical activities (Berchtold NC & al, 2005, p860), Regular exercise may also reduce stress, anxiety, and depression—all factors that can influence academic success. (Ekeland E & al, 2005, p49).

Conclusion

Based on the results of this study conducted on middle school students aged between 12 and 15, we conclude that there is a strong correlation between academic achievement and the level of physical ability among students. Academic performance is influenced by the level of physical fitness — the better a student's physical fitness, the higher their academic achievement. In other words, when an individual or student possesses good physical fitness, their functional abilities improve, supporting self-regulation and behavioral control, which positively affects the cognitive and psychological variables linked to academic achievement. This contributes to improving academic learning levels among middle school students. Therefore, the researchers recommend that decision-makers, school principals, physical education teachers, and administrators adhere to guidelines that ensure the moderate and regular practice of physical activities to improve students' physical fitness, thereby enhancing their physical health and academic learning effectiveness. We also suggest that researchers expand this study through new research and select samples from various educational regions to generalize the findings.

Conflict of Interest

The authors declare no conflict of interest. All observations, interpretations, and recommendations presented in this article are based on professional experience and research conducted independently.

Keywords Adolescent Tattooing , Tattoos motivations, Psychosocial Difficulties, potential risks, Therapeutic Interventions.

Abstract

This article explores the psychosocial difficulties faced by adolescents who get tattoos. The study investigates how individual, social, and cultural factors interact to contribute to these challenges. It examines the motivations behind adolescent tattooing, the potential risks, and the long-term impact on psychological well-being and social integration.By synthesizing existing literature and offering critical insights, this paper aims to foster a deeper understanding of the psychosocial implications of adolescent tattooing, informing clinical practice, educational initiatives, and future research endeavors.

Introduction:

Adolescence is a critical juncture in human development, marked by significant changes in cognitive, emotional, and social dimensions. During this period, young individuals engage in the exploration of identity, navigate complex social relationships, and strive for greater independence. This transitional stage can present both challenges and opportunities for their psychological and social growth (Armstrong & Murphy, 1997). The practice of permanently adorning the skin with tattoos has become a common avenue for adolescents to express themselves and modify their physical appearance. Given the increasing prevalence of this phenomenon, a comprehensive

investigation is warranted. Tattooing can be a means for adolescents to articulate their individuality and forge connections with their peers (Köle, 2018). However, the decision to acquire a tattoo during adolescence carries potential risks and consequences, as young individuals may not fully comprehend the long-term implications, and tattooing can be linked to other risky behaviors (Roberts & Ryan, 2002). This study aims to explore the psychosocial challenges associated with adolescent tattooing, investigating the underlying motivations, potential risks, and the long-term implications for psychological well-being and social integration.

1. Adolescence, an expanding phase:

Adolescence is a multifaceted stage of human development, marked by a series of profound physical, cognitive, and psychosocial transformations. The adolescent years are characterized by a heightened sense of vulnerability, as individuals navigate the complexities of identity formation, peer relationships, and the desire for autonomy.

During this critical phase, adolescents experience a shift from relying on parental guidance and societal norms to a strong desire for self-determination and freedom. This transition can lead to increased risk-taking behaviors, including substance abuse, delinquency, and premature sexual activity. (Zaky, 2017) Adolescents may also engage in body modification practices, such as tattooing, as a means of asserting their individuality and exploring their evolving sense of self.

Adolescence is a stage of life that has undergone significant changes in recent decades, with the onset of puberty occurring earlier and the transition to adulthood taking longer. (Köle, 2018) This expanding phase of adolescence presents both challenges and opportunities for young individuals as they navigate the complexities of this developmental stage.

Developmental theorists describe adolescence as an extended transitional period lasting up to 20 years or more, with distinct early, middle, and late stages. The final stage involves consolidation into adulthood, marked by increased intellectual engagement, seeking new experiences, forming a stable identity, balancing self-interest and concern for others, and establishing clearer boundaries between the self and social context. (Ayubi, 2020).

The study of adolescence has attracted diverse theoretical perspectives across multiple disciplines, focusing on both individual and sociocultural aspects of development. Psychoanalytic theories have been expanded to recognize the dynamic interaction between biology, cognition, and social influences in shaping adolescent experiences. Key theories, such as Erikson's psychosocial theory, highlight the identity formation challenges faced by adolescents as they navigate different roles, values, and beliefs to establish a coherent sense of self ("Adolescence: Developmental Stage and Mental Health Morbidity," 2011)(Mauger, 1995).

Contemporary research highlights the complex, multifaceted nature of adolescent development, emphasizing the interconnected influence of various environmental factors and the importance of positive youth development and acknowledging the diversity of adolescent experiences.The psychosocial dimensions of adolescence are further complicated by the increasing impact of technological advancements and societal changes, which present both opportunities and challenges for the current generation of young people. ("Adolescence: Developmental Stage and Mental Health Morbidity," 2011)

2 . A Brief History of Tattooing:

Tattooing has a longstanding and culturally diverse history, tracing its origins back thousands of years across various civilizations globally.

Tattooing is a practice with a rich and diverse history, emerging from various cultural traditions across the globe. Archaeological evidence suggests that ancient civilizations utilized tattoos for therapeutic, ritualistic, and cultural identity purposes (Tsang & Stevenson, 2014). The act of tattooing involves the introduction of pigment into the dermis layer of the skin, creating permanent designs or patterns (Köle, 2018). The term "tattoo" is derived from the Polynesian language, reflecting the transnational nature of this art form. Historical figures, such as the Iceman Ötzi and Pazyryk chieftains, demonstrate how tattoos were employed to convey social status, group affiliation, and personal narratives, particularly in societies with limited written language (Köle, 2018). In certain contexts, like ancient Egypt, tattooing was considered a sacred and prestigious artistic practice. However, in

Europe, tattoos became associated with lower socioeconomic classes during the early 20th century. This enduring art form continues to evolve, with contemporary techniques, aesthetics, and socio-cultural meanings shaping its trajectory (Tsang & Stevenson, 2014).

Tattooing has undergone a notable transformation in its societal perception, transitioning from historical associations with deviance, criminality, and psychopathology to its contemporary status as a widely accepted form of self-expression (Johnson, 2023). Today, tattoos are embraced by individuals across diverse demographic and socioeconomic backgrounds, signifying a substantial shift in attitudes toward body modification (Johnson, 2023).

3 .Theoretical Frameworks Underpinning Adolescent Tattooing:

Adolescent tattooing can be examined through the lens of various theoretical frameworks, including the Theory of Planned Behavior and the concept of the "tattooed self."

The Theory of Planned Behavior suggests that an individual's intention to engage in a particular behavior, such as obtaining a tattoo, is influenced by their attitudes, subjective norms, and perceived behavioral control. Specifically, this theory posits that an individual's beliefs about the consequences of a behavior, the social pressures they perceive, and their perceived ability to carry out the behavior all contribute to their ultimate decision to engage in that behavior. According to this theory, adolescents' attitudes towards tattooing, the perceived social norms surrounding it, and their perceived ability to obtain a tattoo can all play a significant role in their decision to do so. The notion of the "tattooed self" provides further insight into how tattoos can serve as a means of self-expression and identity construction during adolescence. While these theoretical frameworks offer valuable perspectives on the underlying drivers and implications of adolescent tattooing, it is also important to consider the broader societal context and its impact on this phenomenon. (Köle, 2018)

Another theory that can be applied to understanding adolescent tattooing is the Developmental-Contextual Theory of Identity Formation, which suggests that the process of identity formation is highly influenced by the individual's social and cultural contexts. (Armstrong & Murphy, 1997)(Houghton et al., 1996)In the case of adolescent tattooing, this theory would suggest that the decision to obtain a tattoo is not solely a personal choice, but is also shaped by the individual's peer group, family dynamics, and broader societal attitudes towards body modification.

There is also the theory of Rebellion and Individuation, which posits that during adolescence, individuals often engage in risk-taking behaviors, such as tattooing, as a means of asserting their independence and individuality from their parents and other authority figures. This theory suggests that adolescents may view obtaining a tattoo as a way to distance themselves from the expectations and control of their parents or other authority figures, and to assert their own sense of autonomy and self-expression. The desire to rebel against societal norms and establish a unique identity can be a significant driver for adolescents to engage in body modifications like tattooing. Additionally, the physical and psychological changes associated with this developmental stage can further contribute to an individual's motivations for seeking out tattoos as a form of self-exploration and identity formation. (Köle, 2018)

From a psychoanalytic standpoint; Tattooing during adolescence can also be examined through a psychoanalytic lens, which suggests that the decision to obtain a tattoo may be driven by unconscious psychological factors. Some psychoanalytic theorists argue that tattoos can serve as a form of self-mutilation or a means of expressing unresolved conflicts or traumas, particularly those experienced during childhood. While this psychoanalytic perspective offers a unique angle for understanding the motivations behind adolescent tattooing, it is important to acknowledge that not all individuals who obtain tattoos during this developmental stage may be driven by such unconscious psychological factors. (Ferreira, 2011)(Wohlrab et al., 2007)(Armstrong & Murphy, 1997)

The interaction between genetics and environmental factors in shaping personality traits, such as impulsivity and sensation-seeking, can further contribute to an adolescent's likelihood of engaging in tattooing behaviors. The dynamic interplay of gonadal steroid hormones, such as testosterone and estrogen, during puberty exerts a profound influence on the development and maturation of brain regions involved in emotional regulation and cognitive control (Dukes, 2016; Tsang & Stevenson, 2014). These hormonal fluctuations can heighten emotional reactivity, increase sensitivity to social stimuli, and modulate reward-seeking behaviors, all of which can contribute to an adolescent's propensity to engage in tattooing as a form of self-expression or rebellion. Additionally, the

neurobiological changes that occur during adolescence can affect cognitive processes such as decision-making, risk assessment, and impulse control (Yen et al., 2012).

In addition to the theoretical frameworks discussed, it is essential to consider the broader societal context and its impact on the phenomenon of adolescent tattooing. Over the past few decades, there has been a significant shift in the societal perception of tattoos, with a transition from being associated with deviance and marginalized groups to a more mainstream form of self-expression. This shift has been influenced by various factors, including the increased media exposure of tattooed celebrities and entertainers, as well as the gradual acceptance and normalization of body modifications within mainstream culture. (Tsang & Stevenson, 2014).

4. The appeal of tattooing among adolescents: Reasons and Motivations:

Adolescents frequently engage in the practice of tattooing for a multitude of reasons, both intrinsic and extrinsic in nature. The motivations underlying their decision to obtain tattoos can be deeply personal, stemming from the individual's developmental stage, identity formation processes, and sociocultural context (Tsang & Stevenson, 2014).

4 .1 Tattoos as a form of self-expression:

Adolescents may use tattoos to convey their unique identity, values, and sense of belonging (Tsang & Stevenson, 2014). Tattoos can serve as a powerful form of self-expression, allowing individuals to externalize and visually represent their internal experiences, emotions, and personal narratives. This can be particularly meaningful for adolescents as they navigate the complex process of identity formation during this critical developmental stage. By adorning their bodies with meaningful symbols, imagery, or text, adolescents can assert control over their physical appearance and communicate aspects of their personality, interests, or life events that may be difficult to express verbally. The ability to customize and personalize their tattoos can foster a stronger sense of individuality and authenticity, which can be crucial for adolescents seeking to establish their unique identity amidst the pressure to conform to social norms (Tsang & Stevenson, 2014).

4 .2 Tattoos and identity:

Tattoos can play a significant role in the development and reformation of identity, serving as a gateway for establishing connections to social groups and forming the basis for the wearer's development of a collective identity (Johnson, 2023). The relationship between tattoos and identity is complex and multidimensional, with individuals using tattoos to express their individuality, commemorate significant life events, or affiliate themselves with particular social groups (Johnson, 2023). Adolescents view the tattoos as objects of self-identity and body art, whereas adults perceive the markings as deviant behavior (Armstrong & Murphy, 1997). Tattoos can heighten the femininity of a woman, which is highly valued by men as it signifies their fecundity. For others, tattoos are an expression of power and resistance, a way to reclaim agency over their bodies and challenge societal norms (Tsang & Stevenson, 2014).

In some cases, adolescents may use tattoos to experiment with different identities or to express aspects of themselves that they feel are not adequately recognized or validated by others.

Tattoos can serve as a means of self-discovery, as adolescents explore different symbols, designs, and locations on their bodies to find ways of representing their inner selves.

4. 3 Tattoos as a coping mechanism:

For some adolescents, the decision to get a tattoo may be driven by underlying psychosocial difficulties, such as a history of trauma, abuse, or mental health challenges. Tattoos can serve as a form of self-harm, a means of reclaiming control over one's body, or a way to externalize and visually represent internal struggles. (Tsang & Stevenson, 2014)(Johnson, 2023) In these cases, the tattoo may become a coping mechanism, a physical manifestation of the adolescent's emotional pain or a way to express their experiences in a tangible form. Tattoos are used by people to share their stories and overcome traumatic experiences (Tsang & Stevenson, 2014). The quantitative study by Liu and Lester indicated that the relationship between body modifications, including tattoos, and histories of emotional abandonment and mental, physical, and sexual abuse is statistically significant (Johnson,

2023). This finding was similarly identified in the quantitative study by Ernst and colleagues (Johnson, 2023). The study examined the association between tattoos and five types of childhood abuse and neglect (Johnson, 2023). Subsequent findings showed that the number of participants with at least one tattoo was highest among participants who also reported experiencing sexual abuse (Johnson, 2023). The study also showed that participants who scored higher on the neglect subscale were significantly more likely to have a tattoo (Tsang & Stevenson, 2014). Tattoos provide healing and a sense of identity, and promote sharing narratives during the therapeutic process (Alter-Müri, 2019). Tattoos can be used as accomplishments and strengths (Alter-Müri, 2019). Tattoos can also act as a constant reminder of what they have overcome, however, problematic it may be (Tsang & Stevenson, 2014).

4. 4 Adolescent tattoos and the quest for individuality:

The drive for individual identity and self-expression is a central aspect of adolescent development. According to research, the process of obtaining a tattoo can be closely linked to an adolescent's desire to establish a unique personal identity and differentiate themselves from their peers. (Pfeifer & Berkman, 2018; "The Promise of Adolescence," 2019) Tattoos can serve as a tangible representation of an adolescent's values, interests, and life experiences, allowing them to externalize and communicate aspects of their personality that may not be readily apparent through their physical appearance or social interactions.

In an environment where conformity and group-based identities are often emphasized, the permanence and visibility of a tattoo can represent a powerful statement of individual identity. Adolescents may use tattoos to signal their membership in specific social groups, subcultures, or belief systems, while simultaneously expressing their personal values, interests, and life experiences.research have suggested that tattoos can serve as a "visual diary" for adolescents, allowing them to narrate their lived experiences and aspirations through the permanent marks on their bodies. (Tsang & Stevenson, 2014)(Pfeifer & Berkman, 2018)

4 .5 Adolescent Tattoos and the Expression of Rebellion:

The adolescent years are often characterized by a desire to assert independence, challenge authority, and rebel against societal norms. Tattoos can serve as a physical manifestation of this rebellious spirit, allowing adolescents to defy parental and societal expectations. The permanence of a tattoo can be seen as a defiant act, a way for adolescents to assert their autonomy and make a lasting statement about their personal choices and values. (Armstrong & Murphy, 1997)

In some cases, tattooing may be a way for adolescents to express their resistance to mainstream culture and align themselves with alternative or counterculture movements.

Many adolescents view tattoos as a form of self-expression and a means of rejecting traditional societal expectations. The decision to obtain a tattoo, especially one that is visible or perceived as controversial, can be a way for adolescents to challenge the status quo and assert their independence from parental or cultural influences. (Köle, 2018).

Furthermore, the association of tattoos with marginalized or non-conformist subcultures can be appealing to adolescents who seek to differentiate themselves from mainstream society and express their non-conformist beliefs and values. The act of getting a tattoo can be a symbolic rejection of societal norms and a way for adolescents to assert their unique identity and resist the pressure to conform. (Armstrong & Murphy, 1997)

however, highlights (Tsang & Stevenson, 2014) that the increasing mainstream acceptance of tattoos has led to a shift in their perception, with tattoos becoming more commonly associated with self-expression and individuality rather than deviance.

4. 6 The pain and hardness of the tattoo experience:

The physical sensation of receiving a tattoo can be a significant factor motivating some adolescents, as they may view it as a test of their endurance and resilience. The pain associated with the tattooing process can be seen as a form of self-inflicted ordeal, allowing adolescents to demonstrate their ability to withstand discomfort and assert control over their bodies. Furthermore, the act of obtaining a tattoo can serve as a bonding experience for adolescents who undergo the procedure together, as the shared experience of pain and the anticipation of the final

result can create a sense of camaraderie and strengthen social connections among peers. Tattoos are often considered a reflection of the inner self, providing a basis for meaning and a sense of belonging (Tsang & Stevenson, 2014). Despite the apparent health risks involved, the desire to achieve an aesthetically pleasing appearance and the associated sense of well-being often outweighs such concerns (Tsang & Stevenson, 2014).The experience of physical pain during the tattooing process is associated with the release of endorphins, the body's natural opioid chemicals, which can elicit positive emotions and a numbing effect. This neurobiological response has been proposed as a potential explanation for the reported phenomenon of some individuals expressing a 'desire for pain' in the context of receiving tattoos. In effect, the pain may be perceived as a gratifying sensation or even serve as a coping strategy for managing psychological distress. (Köle, 2018).

Tattoos have transformed from a fringe practice to a mainstream, lucrative industry (Johnson, 2023), reflecting their growing social acceptance. These body modifications serve multifaceted purposes, functioning as amulets, status symbols, declarations of love, religious symbols, adornments, and even forms of punishment, yet always bearing personal significance, whether simple or elaborate. Tattoos transcend the surface of the skin, serving as testaments to individuals' resilience and capacity for joy, acting as reminders of identity and connection (Lim et al., 2013)(Tsang & Stevenson, 2014)(Köle, 2018).

4 .7 The Role of Peer Influence and Social Belonging:

Adolescence represents a crucial juncture in the social maturation process, characterized by a strong desire for peer acceptance and a sense of belonging within social groups. Tattoos can play a significant role in this process, as they can serve as a visual marker of group affiliation, shared experiences, and a means of strengthening social bonds. The desire to conform to peer norms and gain social approval can be a powerful driver behind an adolescent's decision to obtain a tattoo, as they seek to establish their place within their social networks and cultivate a sense of belonging. (Armstrong & Murphy, 1997)

Adolescents may be influenced by their peers' tattoo practices, with the desire to emulate or be accepted by their social circles leading them to seek out tattoos as a way to signal their membership and alignment with a particular group. The presence of tattoos within an adolescent's social network can normalize the practice, making it appear more acceptable and desirable. Moreover, the act of getting a tattoo with a friend or in a group setting can further strengthen the social bonds and camaraderie within the peer group, as it becomes a shared experience and a visual representation of their connection. (Tsang & Stevenson, 2014)(Daulay et al., 2018)

The peer group's influence on tattooing behavior can be particularly strong during adolescence, as young people are more susceptible to social influence and conformity compared to adults. The fragility of adolescent peer relationships and the risk of social isolation may lead young people to prioritize aligning their behavior with that of their peers, rather than attempting to shift the group's norms. (Haas & Schaefer, 2014).

4. 8. Familial and social factors in adolescent tattooing:

The decision to get a tattoo during adolescence is often influenced by a complex interplay of familial and social factors. Parental attitudes and values regarding body modifications can significantly impact an adolescent's decision to get a tattoo, with more permissive or approving parental views potentially encouraging the behavior (Children, 2011).

The modern family structure prioritizes planned and desired children over intergenerational bonds (Breton, 2016), leading to a less nurturing environment for adolescents. As a result, young people's focus has shifted towards peer groups and adolescent culture, which can foster belonging and self-expression, but may also delay their transition to adulthood and perpetuate an adolescent consumption-oriented mindset (Breton, 2016).

Furthermore, the quality of the parent-child relationship and the level of parental monitoring and support can act as a buffer against the negative consequences associated with adolescent tattooing, as strong familial bonds and open communication can help guide young people towards healthier coping strategies and decision-making. (Sacca et al., 2021)

The influence of peer groups and social circles is also a critical factor in shaping adolescent attitudes and behaviors towards tattooing.

As discussed earlier, the desire to belong to a particular social group and the pressure to conform to group norms can be powerful drivers for adolescents to seek out tattoos as a means of signaling their membership and status within that group. (Tsang & Stevenson, 2014)(Weiler et al., 2024).

The broader social and cultural environment can also shape adolescent attitudes towards tattooing. Exposure to tattoo culture, either through media, peers, or one's local community, can normalize the practice and make it seem like a common or even desirable form of self-expression. In contrast, communities with more conservative social norms and negative perceptions of tattoos may discourage adolescents from getting them, leading to a lower prevalence of tattooing among young people in those areas. (Silver et al., 2009).

5. Psychosocial Difficulties: Emotional Regulation, Identity Formation, and Social Integration:

Tattoos can become intertwined with emotional regulation, identity formation, and social integration, potentially leading to psychosocial difficulties for some adolescents.

5. 1 Emotional Regulation Difficulties:

Some adolescents may use tattoos as a form of self-soothing or emotional regulation, particularly in response to experiences of stress, anxiety, or depression. In such cases, the act of getting a tattoo may provide a temporary sense of control or relief from negative emotions, but it can also serve as a maladaptive coping mechanism that avoids addressing the underlying emotional issues.

Tattoos can provide a sense of control or empowerment for adolescents who feel like they lack control over other aspects of their lives. The act of choosing a design, selecting a location on the body, and enduring the tattooing process can create a sense of agency and self-determination, which can be particularly appealing for adolescents who are navigating feelings of powerlessness or uncertainty.

However, relying on tattoos as a primary means of emotional regulation can have negative consequences in the long run. The temporary relief or sense of control that tattoos provide may be addictive, leading to a cycle of impulsive tattooing behavior and emotional dependence on the practice.

This dependence on tattoos for emotional regulation can also hinder the development of more adaptive coping strategies, such as seeking therapy, engaging in healthy activities, or developing strong support networks (Johnson, 2023).

Moreover, the long-term consequences of impulsive or poorly considered tattoo decisions can exacerbate emotional difficulties, as regret, social stigma, or dissatisfaction with the tattoo can lead to increased feelings of anxiety, depression, or low self-esteem (Dukes, 2016).

5. 2 Identity Formation Issues:

Tattoos can serve as a visual representation of one's identity, communicating aspects of the self to others and reinforcing one's sense of self-understanding. However, the use of tattoos for identity formation can also present challenges for adolescents, particularly if their identity is still developing or if they are struggling with issues of self-esteem or self-acceptance. This can lead to feelings of inauthenticity and disconnection, as the individual struggles to reconcile their external image with their internal sense of self (Johnson, 2023)

Moreover, relying on tattoos as a primary means of identity formation can hinder the development of a more complex and nuanced sense of self, as the individual may become overly focused on their external appearance and neglect other important aspects of their personality and character (Alter-Müri, 2019).

The study highlights the role of sexual abuse and the frequency of tattoos to overcome such traumatic experiences to overcome the feeling of alienation of their bodies (Tsang & Stevenson, 2014).

Furthermore, the permanent nature of tattoos can create challenges for adolescents as their identities evolve over time.

What may have seemed like a meaningful or relevant tattoo at one point in their lives may later become a source of embarrassment or regret, as their tastes, values, and beliefs change.

Tattoos are seen as objects of self-identity for adolescents (Armstrong & Murphy, 1997).

5. 3 Social Integration Challenges: Confronting Social Stigma and Discrimination:

Adolescent tattooing can significantly affect an individual's social integration and relationships. Tattoos can lead to stigma, discrimination, and exclusion from certain social groups or institutions, despite their potential to facilitate bonding and connection with like-minded individuals. Visible tattoos are often viewed negatively, as they may be perceived as unprofessional, rebellious, or linked to deviant behavior, which can ultimately harm employment opportunities and future prospects (Lim et al., 2013).

The concept of labeling theory suggests that individuals with visible tattoos may be labeled as "different" or "outsiders" by society, which can result in a self-perpetuating cycle of social exclusion and diminished life prospects and increased marginalization, especially during the crucial developmental stage of adolescence (Liu, 2014)(Dukes, 2016). Adolescents with tattoos may encounter strained family relationships, experience bullying and exclusion from their peers, and face prejudice and discrimination in various social settings, all of which can exacerbate feelings of isolation, low self-worth, and challenges in developing healthy interpersonal relationships (Silver et al., 2009).

Joining specialized tattoo communities can offer tattooed individuals a sense of belonging and social support, allowing them to share personal stories, express distinct identities, and collectively challenge societal norms. However, this dependence on such insular communities may also restrict exposure to diverse perspectives, potentially impeding personal growth and critical thinking. Within these insular environments, individuals may primarily encounter viewpoints and values that reinforce their own, which could constrain their capacity for personal development and nuanced analysis. (Drazewski, 2013; Solís-Bravo et al., 2019; Vanston & Scott, 2008).

In contrast, within certain subcultures, tattoos are viewed as acceptable and can even promote a sense of belonging and unity among group members (Köle, 2018). They function as symbols that represent group identity and foster camaraderie. However, it is important to recognize that these benefits may be confined to specific social circles, as individuals with tattoos may still face stigma and discrimination in wider societal contexts.

6. Potential Negative Consequences and Risks of Adolescent Tattooing:

Although tattooing can function as a avenue for self-expression and identity development among adolescents, it is also linked to a range of potential negative outcomes and dangers.

One significant concern is the increased likelihood of engaging in other high-risk behaviors among adolescents with tattoos. Studies have shown that adolescents with tattoos are more likely to participate in activities such as substance abuse, risky sexual behavior, and delinquent acts, suggesting a correlation between tattooing and a general propensity for risk-taking (Roberts & Ryan, 2002).

Another key concern is the potential for long-term physical and mental health consequences. Tattooing can expose adolescents to the risk of blood-borne infections, such as hepatitis B and C, as well as bacterial infections, allergic reactions, and the potential for scarring or disfigurement. Furthermore, the permanence of tattoos can lead to significant regret and psychological distress later in life, particularly as adolescents' interests, values, and self-perceptions evolve over time.(Vanston & Scott, 2008)

Moreover, the social stigma and discrimination associated with tattoos can further exacerbate the negative impact on mental health, leading to feelings of isolation, low self-esteem, and body image dissatisfaction. (Yen et al., 2012).

Additionally, the social stigma and discrimination associated with tattoos, particularly in certain professional and educational contexts, can have significant negative impacts on an adolescent's future opportunities and prospects. This social stigma can further exacerbate the challenges faced by adolescents with tattoos, as they may encounter obstacles in securing employment, accessing educational opportunities, or forming meaningful

relationships with those who hold negative perceptions about body modifications. The lasting consequences of these social barriers can significantly limit an adolescent's personal and professional growth, underscoring the need for a more accepting and inclusive societal approach to the expression of identity through tattoos.(Dukes & Stein, 2014)

The psychosocial difficulties associated with adolescent tattooing are multilayered and complex in their dimensions. Tattoos can function as a mechanism for self-expression, identity development, and social integration, but they also entail considerable risks and potential adverse outcomes (Roberts & Ryan, 2002)(Tsang & Stevenson, 2014)(Vanston & Scott, 2008).

Ultimately, the complex interplay between individual motivations, psychosocial factors, and societal perceptions highlights the need for a multidimensional approach to understanding and addressing the challenges associated with adolescent tattooing.

7. The Role of Therapeutic Interventions and Support Systems:

Addressing the psychosocial challenges of adolescent tattooing requires a multifaceted approach that incorporates therapeutic interventions and support systems.

Therapists could explore the underlying motivations and meanings behind tattoos, helping adolescents develop a deeper understanding of their identities and address any underlying emotional or psychological issues (Johnson, 2023).

Tattooing can be linked to traumatic experiences, where individuals may use tattoos to regain control over their bodies and express their experiences (Johnson, 2023; Tsang & Stevenson, 2014).

Sharing narratives through tattoos can be therapeutic, serving as a reminder of what one has overcome (Tsang & Stevenson, 2014).

Schools, community organizations, and healthcare providers can play a crucial role in providing education and resources to adolescents and their families about the risks and potential consequences of tattooing.

For example, incorporating information about the potential risks and benefits of tattoos into health education curricula can promote informed decision-making among adolescents (Armstrong & Murphy, 1997).

Furthermore, fostering open communication and supportive relationships within families and peer groups can help adolescents navigate the social and emotional challenges associated with tattooing.

Moreover, interventions should aim to promote positive self-esteem, body image, and coping skills among adolescents, empowering them to make informed decisions about their bodies and their futures.

Additionally, educating parents, educators, and other influential adults about the psychosocial complexities of adolescent tattooing can help foster greater understanding, empathy, and support for young people who choose to get tattoos.

Incorporating information about blood-borne diseases, permanent markings, and the growing and changing nature of adolescents themselves can promote informed decision-making in health education (Armstrong & Murphy, 1997).

It has been reported that tattoos allow the wearer to “express what is inner, by altering the outer surface of the body itself (Johnson, 2023).

Therefore, in clinical settings, visible tattoos may serve as an initial point of contact, providing clinicians with valuable opportunities to explore deeper psychological issues and facilitate meaningful therapeutic engagement.

The frequency of tattoos can play a role in overcoming such traumatic experiences in order to overcome the feeling of alienation of their bodies (Johnson, 2023; Tsang & Stevenson, 2014).

Ultimately, by addressing the psychosocial difficulties associated with adolescent tattooing through a combination of therapeutic interventions, family support, educational initiatives, and harm reduction strategies, we can empower adolescents to make informed decisions about their bodies and identities, while promoting their overall well-being and social integration.

8 . Gaps in the Literature and Future Directions for Research:

While the existing research has provided valuable insights into the psychosocial difficulties associated with adolescent tattooing, there are still several gaps in the literature that warrant further investigation.

A key focus for future research should be examining the long-term trajectories and outcomes of adolescents who have obtained tattoos, particularly with respect to their educational attainment, professional achievements, and social integration. Longitudinal studies could shed light on the lasting impact of tattoos acquired during adolescence and help identify effective strategies for mitigating potential harms.

Additionally, more research is needed on the role of cultural and societal factors in shaping the psychosocial experiences of adolescents with tattoos. Cross-cultural comparisons and examinations of the influence of media, social norms, and institutional policies could provide valuable insights into the complex sociocultural dynamics at play. (Weiler et al., 2024)(Köle, 2018)(Telesia et al., 2020)(Sacca et al., 2021). Further investigation into the cognitive and emotional processes underlying the aesthetic appreciation of tattoos is warranted (Weiler et al., 2024).

Conclusion:

The existing research on the psychosocial difficulties associated with adolescent tattooing highlights the complex and multifaceted nature of this issue.

While adolescents may be drawn to tattoos as a means of self-expression and identity formation, the social stigma, potential health risks, and links to other high-risk behaviors can have profound and long-lasting consequences.

To effectively address this challenge, a comprehensive, multidimensional approach is needed one that considers the unique developmental needs of adolescents as well as the broader social and cultural factors at play.

By deepening our understanding of the underlying motivations and psychosocial factors involved, researchers and policymakers can work to develop targeted interventions and support services to assist adolescents in addressing the multidimensional challenges associated with body modification practices in a safe and healthy manner.

Keywords Online storytelling, audience experiences, news innovation, technological impact AI disruption, AI-driven media.

Abstract

This study explores how online storytelling has evolved before and after AI, focusing on changes in text, image, video, and audience experiences. It analyzes how digital media platforms adapt their informational strategies in response to AI challenges. This comparative content analysis explores the evolution of online storytelling strategies by theorizing the engagement of these platforms with the pressures and benefits of AI integration. The results reveal important new perspectives on how digital media might adapt to technological disturbance. The diversity of content published across digital press platforms and the disparity with variance between the size, type, and methods of displaying content among these platforms highlight the dynamic changes in audience experiences. Text remains the most common form of online storytelling, but images and videos are increasingly highly regarded in the news industry, reflecting a broader shift in how information is consumed and engaged with by audiences. Our work presents a new way of understanding the evolution of online storytelling through various forms, emphasizing the move towards more significant visual interaction without losing sight of the importance of text. By examining online storytelling before and after AI, this study underscores how digital platforms navigate and reshape audience experiences through adaptive content strategies in an evolving media landscape.

1- Introduction

The shift to the digital age has also shaped other media and content industries beyond journalism – in print, broadcast, music, and gaming – reconfiguring every aspect of their operations and reflecting the changes seen in journalism, producing content, audience relations, and technology. They have revolutionized the creation, production, distribution, use, and storage of information. News platforms struggle to exist and excel in the current competitive news ecosystem (Mishra, 2017). Additionally, the move toward digital platforms and the global information explosion have created a swift and intertwined media environment. It meant that reporters had to match their hands with the changes in media technologies (Waisbord 2019; Pavlik 2001). This has expanded the "5Ws and a H" framework (Ambadas, 2024) so you can use it in data journalism, immersive storytelling, mobile journalism and AI-driven content creation. However, the boundaries between citizens, activists, professional journalists and corporations are being eroded by these developments, with a continuing central role in mediating information (Witschge et al., 2016). Into this shifting environment, scholars have adapted to study news produced by both traditional and non-traditional actors, as well as news producers and audience use practices. Online journalism is changing, and journalists along with scholars need new ways to produce high-quality, up-to-date content that is more accurately based on the media environment we work within (Ambadas 2016; Witschge et al., 2016).

This also leads to the apparent discussion of the basis of innovation —in more precise terms, the convergence with several new technologies and user practices — or, as highlighted even a couple of decades ago, its blend with journalism as a convergence product: the latter note might have served what journalism has turned into in present-day immediacy of the digital realm: the necessity for an engaging audience, for one, and at utilizing the prettiness of the similar empowerment processes that have reshaped their engagement in modern mass communication. The trick to linking the audience is excellent, compelling content; many contemporary digital newsrooms know this (Gravino, Servedio, & Tria, 2024). However, online journalism is more than articles since it includes video, audio, and graphics as interactive graphics. It also uses social media to enhance news coverage and manage the news. As stated by Langton and colleagues (2021), content personalization using AI and machine learning algorithms is a game changer for a personalized user experience without compromising the integrity of journalists. Intelligent recommendation engines are enabled by behavior analytics for content recommendations, and users do not need to sacrifice their privacy at any time. Adaptive Media; An intelligent content distribution platform that provides newsrooms with behavior analytics for intelligent recommendation engines without compromising user privacy. This customization is impossible without privacy-preserving frameworks in online journalism, which are limited in numbers but increasingly needed. As we measure the impact of content, online journalism certainly is changing. It is not just story views anymore; it is how long readers spend on a story.

2- Theoretical Foundation and Literature Review

Modern media theories have played a pivotal role in shaping the evolution of online journalism by examining changes in the production, consumption, and dissemination of news. One such theory, Castells's Network Society Theory (1996), explores how digital networks have restructured societal structures (Fernández-Ardèvol & Ribera-Fumaz, 2022). This theory applies specifically to online journalism, whereby with the shift in the news system from the traditional media systems to the networked digital platforms, the news is no longer stored and forwarded or broadcasted on a scheduled basis. It does not have many flows, but it flows continuously across global networks, promoting greater audience participation, real-time updates, and access to different content sources, fundamentals of modern online journalism.

Agenda-setting theory (McCombs & Shaw, 1972) is another theory directly related to our study's subject because it assumes that the media occupy a pivotal position in determining what people perceive about a particular topic and ranking their importance before others in people's eyes for implementation. (Safran, Safar, & Almakaty, 2024). This theory has been made more truthful in today's digital news environment, where online journalism outlets and news aggregators decide which information is popular among the public and coordinate the entire process. Moreover, algorithms now considerably define what news we watch, discuss, or interact with more actively. This implies that media plays a role whenever news is broken and personalized to fit people's choice and subject matter of desired news delivery; such news would prevent the falsification and manipulation of the truth that we are made to believe and act upon.

Furthermore, the concept of disruption, which Christ Jensen put forward earlier in his theory of disruptive innovation, bears the most in unraveling the misfortune that traditional media companies are likely to fall into in the age of artificial intelligence. Based on disruptive innovation technology, new technologies are launched to reach the low-end or niche market before completely displacing the incumbent industries. (Felix, Lee, Eddie, & Yu, 2024). AI is a revolutionary technology in the field of online journalism which poses great threat to traditional production modes such as investigation and editing.This research seeks to investigate how online news outlets, including TMZ, Huffington Post, and Gizmodo, manage AI's challenges by changing their content creation and news delivery to retain the audience. The manner in which these platforms will be able to innovate while keeping the core values of Journalism will help explain how the traditional media will respond to technological advancement.

Ultimately, (Jenkins, 2006) argues that digital media allows audiences to engage with content actively, produce their own media, and collaborate with others (Ihlebæk, 2017). This change in online journalism represents a move away from being a passive audience and towards one that now acts both as a creator and distributor of content. This participatory culture finds expression in citizen journalism, user-generated content, news consumption as a social media interaction, and questioning traditional journalistic authority with the blurred lines between producers and consumers of news.(Cheriti & Mehiri, 2025, p. 9).

3- Methodology

3-1 Research Design and Sampling Method

This study uses a quantitative comparative content analysis to examine news presentation across five major online journalism platforms: HuffPost, Business Insider, Gizmodo, Mashable, and TMZ. Platforms were selected through purposive sampling based on visitor rates and online influence using data from Semrush and SimilarWeb. A two-tier sampling method was applied, combining purposive selection of platforms with random sampling of 1086 articles from each platform's main page over six months. This approach ensures a representative and unbiased analysis of the platforms' informational strategies (Johnstone, 1989)

Table 01 translates the relationship between two variables; the first is independent, which are the platforms of the study sample, and the second is dependent, which represents the subject of the message (content) and is related to the analytical study sample (1086) posts.

The tabulated units of analysis are the frequencies and percentages of the study community, which embody the type of content that the communicator chooses to publish, except the null values indicated by the symbol (-), which, of course, indicate the absence of political, economic, artistic or social and mixed topics on the Gizmodo platform, as well as the lack of interest of the communicators in the TMZ publications in religious, technological, mixed issues and others.

The general percentages, therefore, indicate the significant increase recorded in the percentage of posts with technological and artistic content, as they reached (36.18%) and (33.13%) respectively, which gives a clear picture of the reality of the message on online journalism platforms and enables us to compare this with the most popular topics in other media outlets in general. The overall variance reached its maximum range from about (0.55%) or (06) posts with mixed content to about (36.18%) or (393) posts with technological content and from zero value (-) or no technological posts on the TMZ platform to (22.92) or (249) posts on Mashable. On average, we find that the size of the presence of technological content is (78.6) posts, followed by artistic content (72), then economic (16.8), and political (16.8).

According to the median value, half of the total posts with technological content are more than (33), while the other half is less than that, and half of the total posts with artistic or political content are more than (27) and (21), respectively, while the other half are less than those two values.

On the other hand, the variance results show a high degree of dispersion in the distribution of technological, economic, and artistic posts, which means that they are less homogeneous than others.

By focusing on a different dimension of the data presented in the table. The general percentages indicate a significant increase in the percentage of reliance on the personal source of the journalist to obtain the material

to be sent on digital press platforms, compared to other sources. This is demonstrated by the majority percentage (98.95%), which indicates the growth of the activity of sending and shaping the message or content by the journalist, in addition to their interest in the journalistic scoop, which means making more efforts to obtain the message or information or create content.

The general disparity in the percentages has reached its maximum, from about (7.73%) or (84) posts on the Business Insider platform to (46.77%) or (508) posts from the Mashable platform that relies on the personal source as a primary reference in the process of publishing news and dealing with media content and its various diverse materials, about the percentage of the personal source to the total number of sources. In contrast, this disparity in the percentage of reliance on other sources of zero value (-) or no personal inclusion in both the Business Insider and TMZ blogs reaches (0.46%) or (05) non-personal inclusions on the Gizmodo platform.

On average, we find that the size of the study sample publications from a personal source is (215) and (2.2) for the average size of publications from other sources. According to the median value, half of the total content publications from personal sources are less than (119), and the other half are more than that value. Also, half of the content publications from other sources are less than their median value (02), while the other half are more than that value. Meanwhile, the variance results show a high degree of dispersion in the distribution of the size of personal content sources from the study sample's vocabulary, which means less homogeneity compared to other sources.

Moving over to the third part of the table, the data reveals the specific types of experiences targeted by online journalism platforms. The tabulated units of analysis reflect the kind of recipient in the communication process via digital press platforms, as the statistical data presents us with the reality of the communicator's interaction with the content of the message according to its recipient (journalists/communicators) target more specialized categories with their publications. The same applies to the general public, whose public life and interests the majority of them fit into the message.

The general variation in the percentages reached its maximum, from about (7.73%) or (84) publications from Business Insider and TMZ to (46.96%) or (510) publications in Mashable targeting a general audience, except the missing values indicated by the symbol (-), which suggests the absence of publications targeting a specific audience in each of Business Insider, Mashable, and Gizmodo. The percentages indicate a significant increase in the rate of journalists publishing general content, reaching (80.91%) or (879) posts. This means broad categories of recipients or users of online journalism platforms are targeted by messages with general content. On average, we find that the number of posts targeting a general audience is 175.8, and according to the value of the median, half of the number of posts targeting a general audience exceeds 96, while the other half exceeds that. On the other hand, the variance results show a high degree of dispersion in the first category, which means there is less homogeneity than its counterpart.

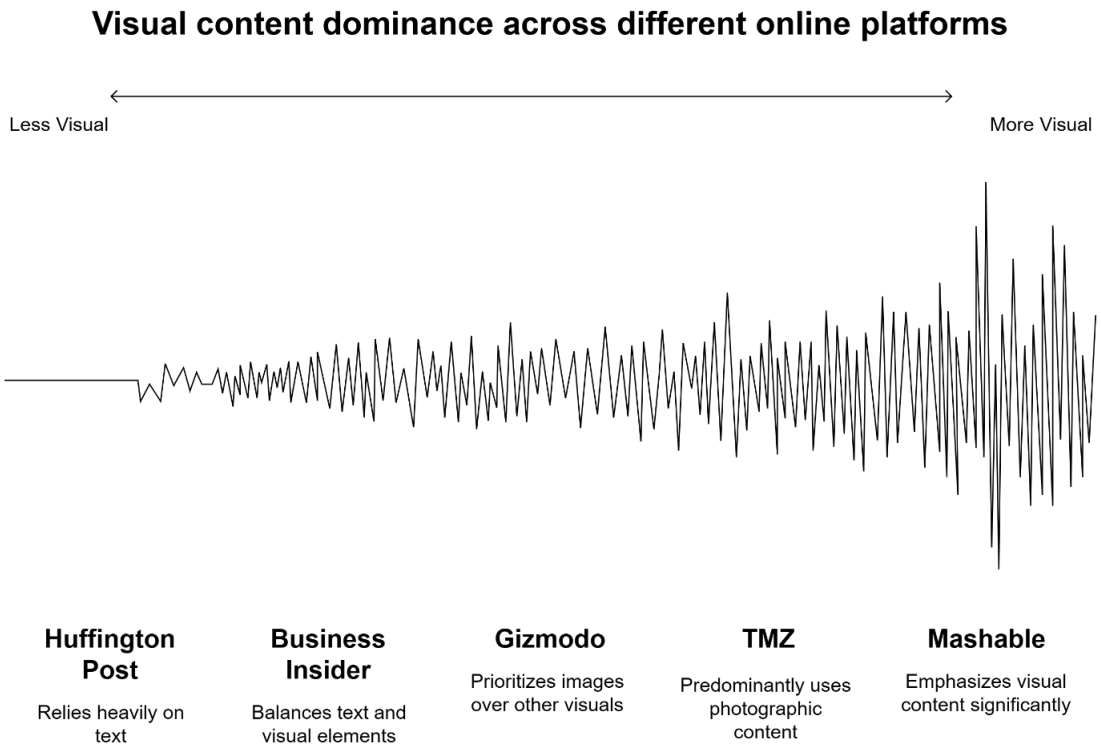

Figure 1

Self-designed Visualization of Prominent Online Journalism Platforms Profile in 2024.

Note. Data sourced from SimilarWeb (2024) and Semrush (2024).

Figure1; indicates the absence of topics in the form of audio or link in the publications of the study sample, which may be due to factors, the most important of which is the emergence of applications and platforms specific to audio and link media that are more effective than digital news platforms. The general percentages, therefore, indicate the significant increase in the demand for "text publishing" and the dominance of what we can call "the authority of electronic text" over other forms. This pattern, represented by the demand for using text in a way that exceeds other media, indicates, first of all, the nature of electronic platforms and the compatibility of the act of making news, whether recorded or written text, where the difference is only between the paper and electronic space, while the act remains the same. Therefore, it is natural for the proportion of text to increase compared to other forms. The overall variance reached its maximum range from about (3.22%) or (35) text posts in Gizmodo to (22.09%) or 240 text posts in Mashable, which is the same for the image medium in both platforms. In comparison, the variance reached its maximum range from about (0.82%) or 09 video posts in Business Insider to (2.76%) or (30) video posts in Mashable.

On average, we find that the size of the text presence in digital press platforms is 97.2 posts, followed by the image (96.8) and then the video (23.2). Depending on the value of the medium, half of the total posts in the text form are more than (50) while the other half are less than that, and half of the total posts in the image or video form are more than (49) and (26) respectively, while the other half are less than those two values. On the other hand, the variance results show a high degree of dispersion in the distribution of text and image posts, which means that they are less homogeneous than others.

A closer examination of the subsequent section of the table reveals notable trends in the shape and type of images utilized, further highlighting their strategic role in tailoring visual content to audience preferences and platform-specific requirements. The analysis units that we dealt with the statistical data reveal to us how journalists employ and use the image medium and the extent of benefit from the applications provided by computer programs for dealing with that medium (Photo editing software) or photographic devices and other means or mechanisms that activate the role of the image medium and help it spread the message, as it is a crucial media container and carrier among other media (text, sound).

However, the null values symbolized by the sign (-) are excluded from this statistical data, which do not indicate percentages, of course, but rather the lack of use by journalists of the animated image with the suffix (gif) or the form of icons that appear more dynamic and interactive than other forms and suffixes of images, as it is considered an element of attraction for the blog reader or visitor, and thus acquires excellent importance in embodying the content of the message, as it may be due to the lack of compatibility of the topic of the post with its embodiment in the form of an animated image, in addition to the lack of interest in the forms in which the contents of the posts and their inclusions are employed, as much as the direct focus on the topic of the post. Still, there will inevitably be great opportunities for Them to enrich the meaning and significance of the message's contents.

The overall variation in the percentages reached its maximum from about (54.05%) or (20) Business Insider posts containing a photograph to (71.42%) or (35) posts in Huffington Post, and from (4.58%) or (11) posts containing designed images to (20) or (07) posts containing designed images, and from about (2.91%) or (07) in Mashable to (32.43%) or (12) posts containing flash images.

On average, we find that the number of photographs is higher than the averages of other forms of pictures in the publications of the digital press platforms in the study sample, as it amounts to (76.6) photographs compared to (9.4) (10.8) for designed photographs and flash photographs, respectively. According to the median value, half of the pictures are less than 35, while the other half exceeds that value. Also, half of the number of different forms of photographs (designed photographs, flash) is less than (08,07), while the other half exceeds that value.

By examining the data on picture size, the table highlights significant preferences in dimensions, shedding light on how platforms prioritize visual clarity and aesthetic appeal. The general percentages indicate a substantial increase in the rate of journalists' focus on including images larger than (300300) pixels, i.e., more than (7.95 x 7.95) cm, as they represent more than half of the size of published images, which means that their area exceeds 63.20 cm2 or (17316.8) cm2 combined, if the frequency of their appearance on the pages of digital press platforms is calculated, which reflects the extent of the richness of the content or message embodied in the image medium on the one hand, and an aspect of professionalism and control over the image as well by modifying its extension, dimensions, and dimensions, Dimensions, Sizes Type on the other hand. The general variation in the percentages reached its maximum extent from zero value (-) or no post in Gizmodo that contained images smaller than (100 x 100) to about (6.19%) or 30 posts in TMZ.

On average, we find that the size of images with more than (300 x 300 pixels) in digital press platforms is higher than the average size for images with (less than 100 x 100 pixels) and (from 100 x 100 to 300 x 300 pixels), where it reaches (54.8) images in the first.

In contrast, it goes (27.4) and (14.6) images in the second and third, respectively. According to the median value, half of the total size of images with (300 x 300 pixels) is less than 35 images, while the other half exceeds that value. In comparison, half of the total size of images with (less than 100 x 100 pixels) and (100 x 100 to 300 x 300 pixels) is less than (06) and (14) images, respectively, while the other half exceeds those two values. At the same time, the variance ratio indicates a high percentage of dispersion in the distribution of individuals in the third category sample, which means that it is less homogeneous than others.

The section of the table dedicated to video duration unveils significant variations in time lengths, underscoring how platforms tailor content to optimize viewer interest and completion rates. The tabulated analysis units reveal the time of video files' inclusion in digital press platforms and the implications of that for the journalist as the video and the image, its duration is linked to the extent of interest and its strength for the

sender in this case; that is, the longer the video, the more it indicates a type of interest of the journalist in the message and vice versa.

The general variation of the percentages reached its maximum from zero value in Business Insider, which was devoid of video files less than a minute, to about (7.75%) or (09) video files in TMZ and from (7.75%) or (09) video files in Business Insider, to (20.68%) or (24) files for the second category (from one minute to 5 minutes).

In addition, the general percentages indicate an increase in the rate of video files ranging from one minute to 5 minutes, reaching (48.25%) of the total number of video files included in digital press platforms. Any double (02) percentage of files less than one minute, which is a suitable time for the nature of the platform on the one hand and the content of the message on the other hand. On average, we find that the period for video files from one minute to 5 minutes reaches 18.6 files. Thus, it is higher than the two remaining periods (less than a minute) and (more than 5 minutes), as their averages reach (4.40) and not a minute (-) respectively, and according to the value of the median, half of the total period for video files ranging between one minute and 5 minutes is less than 19 files, while the other half exceeds this value, while half of the total period for video files (less than a minute) and (more than 5 minutes) is less than (05) and not a minute (-) respectively, while the other half exceeds that value.

The variance results also clearly indicate a high percentage of dispersion in the second category's vocabulary distribution, which means less homogeneity.

Discussion

This section examines how the research findings connect online journalism content to AI. It explains how the findings apply to discussions of current online journalism platforms and how to address AI shortcomings while preserving the principles of objectivity and fairness in reporting.

Characteristics of Content in Online journalism Platforms

This research contributes helpful insights regarding the key quality elements of content in online journalism, focusing on the users and the interaction with the content. It is imperative that we expand our understanding of three vital categories of content generalizations that foster user interaction in the digital realm: The most aspects of usability are; reach and accessibility, interactivity and customization/personalization. For real change, however, content has to be findable and consumable. (Avgousti and Papaioannou2023). The content must have a large audience, as well as engage both the new viewers and those who earlier may not have shown much interest. These are quite useful on several platforms, which eventually raises the post's reach and exposure. In turn, when the users observe active participation of their companions, their interest is piqued, and they follow the example of their friends. (Ijomah et al.2024). By focusing on these aspects, the online journalism platforms will be able to better the objectives and functioning thus actively contributing to the online journalism practice. A research shows that the online journalism tool might help increase readership loyalty while actively engaging readers. The addition of such elements, as polls, quizzes and multimedia is effective to increase users' activity. Analysis of prior studies shows that it is beneficial to promote tailored content to the audience in order to increase satisfaction and user retention.(Zayani, 2021)

As our study indicates, while the image plays a significant role in conveying the message, it complements the text, which remains the primary vessel for communication (Cheriti & Mehiri, 2025, p. 17), but some studies have proven that the text is superior to the image element in conveying the message, followed by the video element, not only through the sending activity but also through the activities of liking, commenting and re-sharing, where online journalism users interact with the image more (Kim & Yang,2017). The content material or the message format in the communication process is of great importance, as it feeds the latter and ensures its formation and continuity. Although the nature of the message is the nature of the medium itself, we notice a kind of difference or incompatibility -online journalism platform sample- in the use of message formats,

According to our findings, technological and artistic content are the most prominent across the online journalism platforms in that they take the largest part of the posts. Overall, technological posts were the most common and the next were those containing artistic content. These results are in line with the general increase

in hypertextuality and interactivity towards the consumption of news reported by Villagómez-Rodríguez (2023). This multimedia approach enhances the user experience, in tandem with the increasing mixture of informative, entertaining, and visually stimulating content that characterizes online journalism, addressing a wider audience and encouraging an active news environment (Wunderlich et al., 2022).

Research in communications has explored the direct and media effects of reach in more traditional mass media contexts. Content also needs to be accessible through interfaces or technologies that the audience can use, an idea that moves from one of the key functional criteria for the quality of content, in terms of standard gates to interaction and motivation (Onyejelem & Aondover, 2024). Interactivity is not a keyword but a reflection of the fact that meaningful engagement is an effective way of enriching content. In other words, interactivity may be defined as a set of interactions that result in a transfer of knowledge for at least one party. The more often people engage with one other, the more pronounced the possibility of learning and change. Part of this, which is also particularly impactful in terms of interactivity is what we can describe as participative experiences, that is, the integration of physical capabilities into digital platforms. Moreover, personalization is extremely important in the sense that it enables the creation of personalized content according the specific preferences of different consumers (Wang, 2021). Efforts towards personalization are motivated by consumer interests in both enjoyment and practical benefits. Ultimately the satisfaction that results in individual participation is crucial to the production of a content - as a good - which may be seen as high quality entertainment. By adopting these principles, not only will online journalism platfomrs boost the usability of its content for the user but the content's standard will boost the overall standard too.

Text

The study shows that text content is the most significant type of content on the digital news, which represent the high importance of the text as a media type. The lack of the audio or link post suggests the emergence of other digital environments for these formats. In details, the same study reveals that there is a variation in the number of text, image and video posts made on the different platforms and that most of the posts made are in the form of texts. This pattern underlines the fit of text to the digital environment and the general tendency of news to be produced in textual format. Methods for big data analysis on text data especially in the fast evolving domain of online journalism are being developed rapidly. Nevertheless, in terms of quantitative analysis of the presence of sensitive content in television journalism, quite a few obstacles persist, particularly, the challenges of massive transcription of spoken language. It also lead to the understanding that it is time to develop insights for the newer bigger fields of our traditional media while at the same time underlining the possitive potential for improving our current online journalism with the help of new approaches (de-Lima-Santos et al., 2024)

The use of text in online journalism has taken centre stage in the current society where media consumption is continuously changing. In the course of the advancement of technology in the dissemination and receipt of information, text has been a key component of the new age (Bell et al., 2017). In the same way, Kozhakhmetova et al. (2020) stated that media texts are coheres and integrated messages that can portray social phenomena and can be considered as an actual manifestation of the communication process. Previous works are in agreement with the present study and emphasize the role of the online journalism platforms analyzed in this study, especially when using text as the main content component.

Image

The point of view of the communicator in the media may be clarified in the textthrough some techniques such as editing decisions, hint words, images, .. . (Cheriti, 2024, p. 913)

AlsoJournalists and designers in textual and online journalism organizations use photographs, infographics, and illustrations, among other media, to provide visual storytelling support or add extra relevance or layers of information (Hamza2023). A photograph can make news on its own, a diagram can complement an explanatory article, and an illustration can be the main vector for the cover of a digital magazine.

In this study, we discover that images are intentionally employed by journalists to improve the message they are conveying, and that they have a higher affinity for photographs as opposed to other forms of images such as animated or designed ones. The lack of some image formats, including GIFs and icons, also indicates a

narrow scope of a wider range of image materials. Furthermore, the trend towards bigger images is observed which may indicate the users' interest in clear and business-like image display. The data also presents a clear pattern of differences in image types and sizes, suggesting different methods of handling visual materials. It is crucial to turn to online journalism and pay special attention to the visual elements of images and their important position on the top of the headlines of most news articles. This is an opportunity to learn and appreciate how images influence the perception of news in great detail. (Bengtsson & Johansson, 2021) .

But with this increased focus on images, the detractors of this visual-dominant paradigm opine that visuals carry with it a danger of shallowing out textual density. They argue that overdependence on imagery may create the risk of distorting several issues by quantifying them since images can easily be given different meanings and can imply the complication of all the cases than required. (Huxford, 2023).

In addition, some scholars also remark on how possibly the visual content could propagate gender biases and stereotypes, because online images tend widely to highlight and intensify already existing biases in the society. (Guilbeault et al., 2024). Overall, we can say that whether images play a dominant role in newsprint or hyperlinked online journalism is a deeply matter of opinion.

Video

We find that video durations vary considerably, a reflection of how platforms adjust content to optimize viewership and completion rates. Data indicate that, on average, longer videos usually mean more interest in a message by journalists, but shorter videos are more common – especially in categories ranging from 1 to 5 minutes. Nearly half of all video content falls within this timeframe, making this suitable for both platform freeforms and message delivery. An extensive survey indicates that audiences prefer to watch a video over a online journalism, blog post or an infographic. The same survey predicted that by 2021 video will comprise 82 percent of consumer internet traffic. Journalists just need information to make those editorial choices. That's what metrics provide. To summarize, this evidence shows that video is necessary to increase emotional responses and to reinforce a message in the form of recall and information retention (Zhou et al. 2021).

There is a discussion regarding the nature of text and video in online journalism in the age of the digital revolution. Video has become popular due to the development in video technologies, the increased usage of mobile gadgets, social networking sites. In his study of video journalism, Bock et al. (2023) argue that video journalism is a social and material practice , reshaping the relationship between the journalist and the source (Bock, 2011).

The use of video in online journalism has faced some challenges that include; Resource constraints, Short term focus, and Lack of leadership and training. These factors lead to creation of low-quality videos which do not utilise the video as a medium to its full potential (Kalogeropoulos & Nielsen, 2017; Bock et al., 2023). Moreover, the length of video in online journalism is still unclear, as current research investigates whether news videos are shifting or staying consistent with traditional media habits.

Audience

Furthermore, the findings reveal the increased focus on the targeting of particular and, more so, general audiences with the total number of publications directed to the general public experiencing the most robust growth. Amidst this constantly evolving digital media trend in journalism, the beauty of the written word is seen grossing the audience of the contemporary journalism; when the way of delivering an information has altered completely, the word has to be used tactfully so the reader in the virtuality of digital news feels it and connects with it.

It was pointed out in the seminal research on the "platform press," technology firms control the attention and advertising spaces; therefore, news organisations continue to reshape the structure as well as the mechanisms to fit into this new tech-world. (Bell et al., 2017). Given this perspective, the written content has become perhaps the central point of competitive advantage, since audiences expect to find interesting, insightful, and visually appealing stories in their informational consumption space. Further (Mishra, 2017) the study reveals that interest management has become a major worry for media organizations given that the

readers are now presented with lots of opportunities hence the targeting of both specific and broad audiences for a conducive online journalism platform presence.

Responding to AI Challenges in Online journalism

AI, especially through machine or algorithm-assisted methods, is revolutionizing the landscape of online journalism and deserves our full attention. The benefits are undeniable as it becomes an integral part of how news is produced, curated, personalized, and consumed. Journalists and news organizations or platforms are harnessing a multitude of AI tools to streamline various processes in news production and distribution (Onyejelem & Aondover, 2024). These tools are used in content creation, data analysis, news-worthiness determination, package news for users, engaging audience and manage comments among other functions. It's not a question of whether online journalism platforms should adopt AI or not; it is a requirement for surviving in today's dynamic world of journalism. AI can assist journalists in getting a clearer picture of what is going on in the world in less time than it would take a human to do so, as well as identifying patterns and trends in the data that are not always apparent to human journalists and which they may choose to ignore. In this context, the maximum accuracy within the shortest time possible seems to be deemed more important than the maximum level of disclosure. (Jamil, 2021).

The lack of content variety is a main deficiency in our study sample of online journalism platforms. For instance, the spectrum of topics and related involvement of readers decreases based on absence of the political, economic and social publications and entries. However, as it is, TMZ provides a minimal attention to such important topics as technology and religion. In order to fill these gaps, we could create content using AI to diversify. AI driven recommendation systems could mine on user preferences and recommend topics that were under represented such as politics and economics. Natural language processing (NLP) algorithms could also search for content holes and create material during missing areas such as reach and engagement across platforms.

Furthermore it is quite evident that computer generated writing poses no risk and that in the context of content writing, AI has no advantage in choosing between options. But, the negative information about such events may contribute to the long-term changes of readers confidence. These events could also raise questions regarding how artificial intelligence might be utilized in more indirect ways to control. AI is not capable of identifying and understanding data as effectively as a human being does (Dong et al., 2020). Such could result in unfairness based on liability or even undue discrimination.

Conversely, our study reveals the major shortcomings in online journalism platforms, the most significant of which, in our perspective, is the extreme dependence on individual sources to produce the content; that is to say, the journalist's individual work of acquiring the news and monitoring its contents. This reality, while reaffirming the need for journalistic independence and displaying his personal effort, in turn exposes the narrow range of views and sources.Here in this context, the overwhelming importance of personal sources might inadvertently strengthen bias, restrict the range of content and, narrow the range of perspectives on the opposite side of the news story. This implies that such an approach to sourcing can create an echo chamber effect, where certain common narratives are being reinforced, causing the platform and the depth of its news coverage to lose credibility in the eyes of its readership.

As for this problem, AI presents a potential in increasing content range by using the automated systems that collect and analyze more diverse number of opinions. Conventional information technologies in the form of recommender systems and natural language processing can help determine which topics have been left uncovered and what additional sources, opinions of industry professionals, or other forms of data might be useful. By adopting the use of machine learning analysis in media outlets, journals, and social media, digital press platforms will be able to expand their database and feed the public a more diverse and inclusive view of the events.

Furthermore, the challenges posed by online journalism, including the need for enhanced digital literacy among journalists and audiences alike, are critical for navigating the complexities of the digital information landscape. we argues that while digital journalsim offers new engagement opportunities, it also demands a higher level of statistical and digital literacy from journalists to effectively utilize data journalism techniques.

This necessity for continuous learning and adaptation underscores the evolving nature of journalism in the AI age.

Conclusion

This study has drawn attention to the emerging dynamism on how online journalism operates, with a markedly preference for text-based articles and images, alongside videos to make content more accessible, appealing, and effective. Interactive and personalization factors increase audience engagement but lack of content richness variety and excessive use of self-sources may hinder equal representation. The findings highlight the requirement to solve these issues through AI-enabling the generation of content, advanced data analysis, and individual experience. In order to reinforce thematic offerings on online journalism platforms, the publication of this research suggests a reorientation towards utilizing AI to detect underserved subjects and producing corresponding content. More interactivity by adding dynamic features with multimedia can also make online journalism platforms interesting to the audience. These strategies can help online journalism platforms continue to function, maintain their relevance and standing among other media outlets, and reach a more and broader audience. Thus, they can ultimately ensure their existence in the competitive and rapidly changing digital space.

Limitations and Future Directions

Limitations of the study include the small sample of online journalism platforms as well as our lack of focus on the level of audience engagement and participation. Future research should explore the role of AI in content diversification, its impact on journalistic practices, and its ethical implications.

Conflict of Interest

The authors declare no conflict of interest. All observations, interpretations, and recommendations presented in this article are based on professional experience and research conducted independently.

Keywords	Karl Marx; Revolution; Capitalism; Socialism; Historical Materialism; Class Struggle.

Abstract

The nineteenth century was marked by profound social and political upheavals that reshaped the European intellectual and economic landscape. The revolutionary wave of 1848, initially framed as a democratic struggle, rapidly escalated into a confrontation between antagonistic social forces: workers and capitalists, liberals and socialists, conservatives and reformists. Within this historical conjuncture, and alongside the Industrial Revolution, Karl Marx formulated a philosophy of revolution grounded in historical materialism. He argued that history is governed by objective social laws—laws which, independent of individual will, propel society toward transformation. Central to his thought is the theory of class struggle, where society increasingly polarizes into two irreconcilable camps: the bourgeoisie and the proletariat.

This study revisits Marx's conceptualization of revolution as both a historical necessity and a scientific interpretation of social change. By analyzing the interplay of capitalism and socialism within Marx's framework, it underscores how proletarian uprisings emerge not as accidental events but as structurally determined outcomes of capitalist contradictions. The paper concludes that Marx's philosophy of revolution continues to resonate in contemporary debates on social justice, inequality, and systemic transformation.

Actuality of the Study

The contemporary relevance of Karl Marx's philosophy of revolution extends far beyond its nineteenth-century origins. In an era characterized by widening social inequalities, recurring economic crises, and global debates

on labor precarity, Marx's analytical framework provides enduring insights into the structural contradictions of capitalism. His emphasis on the inevitability of class struggle as a catalyst for societal transformation remains pertinent in analyzing both historical and modern revolutionary movements. Moreover, the transition from capitalism to socialism—conceptualized as a radical restructuring of economic and social relations—continues to inform political theory, critical sociology, and debates on post-capitalist futures. The study thus contributes to current academic and intellectual discourses by situating Marx's revolutionary thought within ongoing global challenges.

Introduction

Karl Marx was not mistaken in declaring that "revolutions are the locomotives of history." Human history is, in many respects, a history of revolutions. Revolutions have consistently dissolved outdated systems and propelled progress, fostering new social, economic, and political structures. Within the theory of historical materialism, humanity continuously reshapes itself through contradictions across historical stages (Marx, 1859/1977).

Marx drew upon French socialist traditions to frame society as being in perpetual crisis, where the oppressed strive to dismantle the chains of domination (Engels, 1845/1975). For Marx, humanity's enduring task is revolution: "Society as a whole is splitting into two great hostile camps, directly confronting each other: Bourgeoisie and Proletariat" (Marx & Engels, 1848/2012, p. 14). This study explores Marx's philosophy of revolution by analyzing the dialectical struggle between capitalism and socialism as interpreted through historical materialism.

1. From *Capitalism to Socialism*

The seventeenth and eighteenth centuries were marked by social revolutions across Europe. Capitalism flourished in Europe's emerging cities, as a robust bourgeoisie challenged feudal structures. The English Revolution of the seventeenth century inaugurated this process, but the French Revolution (1789–1792) delivered the decisive blow to the ancien régime by executing the royal family, abolishing aristocratic privileges, and dismantling feudal constraints (Hobsbawm, 1962).

In the nineteenth century, Europe again experienced profound upheavals. The 1848 revolutions began as democratic movements but devolved into fierce conflicts between workers and capitalists, liberals and socialists, revolutionaries and reformists (Draper, 1977). Political tensions reflected the clash between the conservative bourgeois state and reformist aspirations.

Europe's transition from commercial to industrial capitalism, spurred by the Industrial Revolution, expanded the working class and fostered revolutionary consciousness. Marx (1867/1990) argued that this process made proletarian victory inevitable—rooted not in subjective will but in objective social laws. Capitalism, he contended, was structurally unsustainable, as its exploitative relations of production intensified class antagonism.

The bourgeoisie—owners of the means of production—historically dissolved feudal bonds and transformed global society. Yet, as Marx and Engels (1848/2012) observed, this transformation reduced social relations to "callous cash payment," stripping them of spiritual and moral meaning. In its pursuit of profit, capitalism commodified labor, alienated workers, and created the conditions for its own overthrow (Marx, 1844/1970).

Capitalist economists, according to Marx, obscured the contradictions of the system. However, these contradictions compelled the bourgeoisie to rely upon the proletariat, arming the very class destined to become its "gravedigger" (Marx & Engels, 1848/2012). For Marx, the proletariat alone was capable of revolutionary transformation, as all other classes decayed before the advance of large-scale industry (Lenin, 1917/1964).

2. Socialism and Its Revolutionary Doctrine

Socialism arose as both critique and alternative to capitalism. Though antecedents can be traced to antiquity and medieval thought, modern socialism crystallized in response to industrial capitalism's exploitation (Cole,

1954). Defined broadly, socialism entails public ownership of the means of production to prevent worker exploitation (Schumpeter, 1942/2008).

For Marx, socialism was not merely a moral ideal but a historical necessity. He emphasized that the proletariat, lacking property and compelled to sell its labor, could emancipate itself only by abolishing private ownership of the means of production (Marx, 1867/1990). In the *Communist Manifesto*, he declared that "society as a whole is more and more splitting up into two great hostile camps" (Marx & Engels, 1848/2012, p. 14).

Socialist revolution, therefore, required the proletariat to seize political power, centralize the means of production, and reorganize society on a collective basis (Marx, 1875/1970). Unlike reforms that merely adjusted existing structures, revolution sought the radical overthrow of bourgeois supremacy and the construction of a new social order (Luxemburg, 1906/1971).

Marx insisted that revolution was not a mere political event but a material process born of contradictions between productive forces and production relations. Social revolutions erupted when outdated relations constrained the development of new productive capacities (Marx, 1859/1977). Thus, the task of revolutionaries was to seize state power—the "central question of every revolution"—to dismantle the bourgeois state and establish a proletarian state (Lenin, 1917/1964).

For Marxists, this transitional phase represented the "dictatorship of the proletariat," a necessary stage in moving toward communism, where class antagonisms would dissolve and human freedom would be realized (Marx, 1875/1970). In this vision, socialism and democracy were inseparable: genuine democracy could not exist so long as economic exploitation persisted (Engels, 1891/1972).

The Contemporary Worldview of Marxism

While Marx wrote in the nineteenth century, his philosophy of revolution remains highly relevant in the twenty-first century. Today's globalized capitalism has intensified many contradictions Marx identified, while also producing new forms of exploitation and inequality.

- **Economic Inequality and Global Capitalism.** The gap between rich and poor has widened dramatically, with the top 1% controlling more wealth than the rest of humanity (Piketty, 2014). Marx's critique of capital accumulation and concentration resonates in debates on neoliberalism and global financial crises (Harvey, 2010).
- **Precarious Labor and Digital Capitalism.** The rise of platform economies (Uber, Amazon, Deliveroo) and artificial intelligence has created new forms of precarious employment—gig work, algorithmic control, and surveillance capitalism (Zuboff, 2019). These dynamics echo Marx's analysis of alienated labor, updated for the digital age.
- **Ecological Crisis.** Environmental degradation and climate change highlight capitalism's destructive relation to nature. Scholars have reinterpreted Marx's notion of the "metabolic rift" to explain how capitalist production disrupts ecological balance (Foster, 2000). Here, Marxist ecology provides insights into sustainable alternatives to profit-driven exploitation.
- **Global South and Postcolonial Marxism.** Marx's framework has been adapted to analyze imperialism, dependency, and uneven development in the Global South (Amin, 1976). Contemporary movements link anti-capitalist critique to struggles against neo-colonialism, racial capitalism, and global inequality.
- **Social Movements and Revolutionary Praxis.** From Occupy Wall Street to global climate strikes, Marxism informs critiques of systemic power structures while inspiring collective struggles for justice. While classical proletarian revolutions are rare today, Marxism's emphasis on structural contradictions and collective emancipation continues to inspire resistance.

Thus, Marxism endures not as a closed doctrine but as a living tradition, constantly reinterpreted to address the evolving contradictions of capitalism in contemporary society.

Conclusion

Karl Marx's philosophy of revolution rests upon the principles of historical materialism and class struggle. He argued that capitalism, while historically progressive in its dismantling of feudalism, inevitably creates conditions for its own demise. The proletariat, as the only truly revolutionary class, carries the task of abolishing exploitation and inaugurating a socialist society. Marx's critique of capitalism—alienation, exploitation, and accumulation—remains a cornerstone for understanding systemic inequality and envisioning emancipatory alternatives in modern times.

Karl Marx was instrumental in shaping the philosophy of history and articulating a revolutionary framework that rejected exploitative class systems while envisioning a society grounded in justice and equality. He dismantled deterministic narratives that deprived the working class of its transformative agency, instead emphasizing the centrality of class struggle as the driving force of historical change. His philosophy inspired generations to envision socialist and communist alternatives to capitalism, reshaping intellectual and political discourse across the modern world.

For Marx, revolution is not merely a political event but a profound social movement—an intentional, organized transformation of society that seeks to restructure economic, political, and cultural foundations. Through the dialectics of historical materialism, contradictions between the forces and relations of production become sites of conflict, culminating in systemic rupture. In this sense, history is a history of class struggles, where the transfer of state power from one class to another is both inevitable and necessary.

Whenever injustice, tyranny, and systemic corruption prevail, revolution becomes an urgent necessity. The proletarian struggle, born from the contradictions of capitalism, represents both a critique and a transformative force, capable of redrawing society's balance of power. By mobilizing collective agency, mass uprisings challenge entrenched systems of domination, forging new paradigms of social organization.

In the twenty-first century, Marx's vision continues to resonate in debates on global inequality, labor precarity, ecological crisis, and democratic struggles. His revolutionary philosophy remains a living framework—one that interprets systemic contradictions while offering pathways toward emancipation and solidarity. The legacy of Marx's thought lies not only in diagnosing the flaws of capitalism but in illuminating the possibility of a new socialist vision where human freedom and equality prevail.
